Routledge Encyclopedia of Philosophy

A posteriori

A prominent term in theory of knowledge since the seventeenth century, 'a posteriori' signifies a kind of knowledge or justification that depends on evidence, or warrant, from sensory experience. A posteriori truth is truth that cannot be known or justified independently of evidence from sensory experience, and a posteriori concepts are concepts that cannot be understood independently of reference to sensory experience. A posteriori knowledge contrasts with a priori knowledge, knowledge that does not require evidence from sensory experience. A posteriori knowledge is empirical, experience-based knowledge, whereas a priori knowledge is non-empirical knowledge. Standard examples of a posteriori truths are the truths of ordinary perceptual experience and the natural sciences; standard examples of a priori truths are the truths of logic and mathematics. The common understanding of the distinction between a posteriori and a priori knowledge as the distinction between empirical and non-empirical knowledge comes from Kant's Critique of Pure Reason (1781/1787).

1 Empirical warrant

Kant (1781/1787: A2/B3) notes that 'opposed to [a priori knowledge] is empirical knowledge, which is knowledge possible only a posteriori, that is, through experience' (see Kant, I. §4). Empirical knowledge is a posteriori in virtue of the kind of warrant, or justification, it requires for the proposition known: a kind of warrant somehow grounded in sensory experience. The standard approach to knowledge claims that propositional knowledge requires justified true belief. The belief condition for knowledge, according to this approach, must be appropriately related to the satisfaction of the truth condition, thereby excluding true groundless conjectures from the category of knowledge. This requirement involves a justification condition for knowledge, and this condition typically receives most of the attention from contemporary accounts of empirical knowledge.

Contemporary accounts of empirical, or a posteriorif justification ordinarily seek to explain what sorts of processes (vision, memory, introspection, inference and so on) can, and perhaps standardly do, yield empirical justification for beliefs. These accounts typically assume *fallibilism* about empirical justification: an empirically justified contingent belief can be false (see Fallibilism). These accounts also typically assume that evidence providing empirical justification for a belief need not logically entail that belief, but can be inductive or probabilistic. Although contemporary epistemologists do not share a single account of the kind of probability appropriate to empirical justification, they largely agree that empirical evidence is *defeasible*, that it can cease to be justifying upon one's acquiring broader evidence. Upon approaching an apparent large pool of water on the road, for example, one might lose one's justification for thinking that there actually is such a pool on the road. An account of empirical justification must, in any case, identify a suitable role for sensory experience in the conferring of justification. Otherwise, the distinction between a posteriori and a priori warrant and knowledge will be unclear.

Contemporary philosophers debate whether any necessarily true proposition is knowable a posteriori. Saul Kripke, for instance, has argued that some necessarily true propositions must be known a posteriori if they are to be known at all. His main examples are true identity statements involving names: for example, 'Hesperus is Phosphorus'. Kripke holds that such statements are necessarily true, but that they cannot be known a priori (Kripke 1980). Other philosophers have challenged the view that such identity statements are necessarily true.

2 Coherentism about empirical warrant

Coherentism about empirical justification identifies particular 'coherence relations' among beliefs as constituting empirical justification. Coherence relations can include logical entailment relations, relations of explanation, and various probabilistic, or inductive, relations. Whatever they include, coherentism about empirical justification must identify what makes justification empirical; it must acknowledge a role for sensory experience.

Coherentism about empirical justification faces an objection if empirical evidence can come from a kind of sensory experience that does not require corresponding beliefs descriptive of the relevant sensory experience. Suppose, for instance, that empirical evidence can come from the non-propositional contents (such as visual images) of one's non-belief sensory awareness-states (for example, non-belief visual states). Not all sensory states are, or even require, belief states. One might believe that one has a certain visual image, but this does not entail that the image in question is a proposition one believes; nor does this entail that every visual image requires a corresponding

belief descriptive of that image. Coherentism makes justification depend just on coherence relations among propositions one believes. It thus neglects the evidential role of non-belief sensory experiences in empirical justification. In particular, coherentism apparently permits that what is warranted by coherence relations among one's beliefs can be isolated, or divorced, from the perceptual contents of one's non-belief sensory experiences. This would be a serious defect in an account of empirical justification, justification dependent on sensory experience. Proponents of coherentism have not reached agreement on how to treat the previous objection (see Knowledge and justification, coherence theory of).

Coherentism about justification is often called 'epistemic holism'. According to Quine and others, such holism recommends that we dispense with (1) the analytic-synthetic distinction and (2) the view that our beliefs are tested individually against the input of sensory experience (see Quine, W.V. §3). Our beliefs, given epistemic holism, are confirmed or disconfirmed as a system, collectively rather than individually. In addition, Quine holds, any of our beliefs can be held true come what may, if we make drastic enough changes elsewhere in our system of beliefs; by the same token, none of our beliefs is immune to revision. On this basis, Quine opposes any distinction between the a priori and the a posteriori due to considerations about irrevisability of beliefs. This is not, however, a general argument against the distinction between the a priori and the a posteriori, because some versions of the distinction do not appeal to considerations about irrevisability. Some versions appeal, instead, to considerations about the dependence of relevant evidence on sensory experience.

3 Foundationalism about empirical warrant

The leading alternative to coherentism is *foundationalism* about empirical justification: empirical justification has a two-tier structure in that some instances of such justification are non-inferential, or foundational, and all other instances of such justification are inferential, or non-foundational, owing to their dependence on foundational justification. Bertrand Russell, A.J. Ayer, and C.I. Lewis advanced influential twentieth-century versions of foundationalism about empirical knowledge and justification. Foundationalists differ among themselves on two key matters: the explanation of what precisely constitutes non-inferential, foundational empirical justification, and the explanation of how empirical justification can be transmitted from foundational beliefs to non-foundational beliefs. Opposing the radical foundationalism of Descartes, contemporary foundationalists typically endorse *modest* foundationalism, implying that foundational beliefs need not possess or yield certainty and need not deductively support justified non-foundational beliefs. A foundational belief, minimally characterized, is non-inferentially justified in that its justification does not derive from other beliefs.

Traditionally, empiricist proponents of foundationalism have countenanced foundational justification by non-belief sensory experiences. These empiricists, notably represented by C. I. Lewis, hold that foundational empirical beliefs can be justified by non-belief sensory experiences (for example, your non-belief experience involving your 'seeming to see' a book page) that either make true, are best explained by, or otherwise support those foundational beliefs (for example, the belief that there is, or at least appears to be, a book page here, before you). More recently, proponents of foundational empirical justification by reliable empirical origins have proposed that non-inferential empirical justification derives from a belief's origin in a non-belief empirical belief-forming process (for example, perception, introspection) that is truth-conducive to a certain extent, in virtue of tending to produce true rather than false beliefs. The latter proposal, a species of 'process reliabilism', cites the reliability of a belief's non-belief origin, whereas the previous view invokes, as justifiers, the particular sensory experiences that underlie a foundational belief. Both approaches can, however, accommodate the view that foundational empirical justification is defeasible, or overridable given the acquisition of new evidence (see Foundationalism).

A comprehensive account of empirical justification will explain the nature of sensory experience. If sensory experience does not have a non-conceptual component, it will be ill-suited to serve the purposes of traditional foundationalism about empirical justification. In that case, sensory experience will fail to provide a basis for justified empirical beliefs that does not itself require evidential support. If sensory experience is identical to conceptualization, judgment or belief, then it will itself need evidential support if it is to confer justification on some beliefs; and if this needed support is to be genuinely empirical, it will have to involve more than just propositional relations among beliefs. At least, various proponents of traditional foundationalism have, on this basis, sought a non-conceptual foundation for empirical justification in sensory experience, a foundation that yields a straightforward distinction between a posteriori and a priori warrant.

A priori

An important term in epistemology since the seventeenth century, 'a priori' typically connotes a kind of knowledge or justification that does not depend on evidence, or warrant, from sensory experience. Talk of a priori truth is ordinarily shorthand for talk of truth knowable or justifiable independently of evidence from sensory experience; and talk of a priori concepts is usually talk of concepts that can be understood independently of reference to sensory experience. A priori knowledge contrasts with a posteriori knowledge, knowledge requiring evidence from sensory experience. Broadly characterized, a posteriori knowledge is empirical, experience-based knowledge, and a priori knowledge is non-empirical knowledge. Standard examples of a priori truths are the truths of mathematics, whereas standard examples of a posteriori truths are the truths of the natural sciences.

1 Necessity, analyticity and the a priori

Contemporary understanding of the distinction between the a posteriori and the a priori, as the distinction between the empirical and the non-empirical, derives mainly from Kant's *Critique of Pure Reason* (1781/1787), although versions of it precede Kant in the writings of Leibniz and Hume (see Kant, I. §4). The epistemological distinction between a priori and a posteriori knowledge differs from the logical or metaphysical distinction between necessary and contingent truth, and from the semantical distinction between analytic and synthetic truth (see Analyticity). In particular, the concept of a priori knowledge is not the same as either the concept of what is (logically or metaphysically) necessarily true or the concept of what is true analytically, just in virtue of the meanings of a proposition's constituent terms. Kant's talk of a priori 'modes of knowledge' suggests an epistemological, knowledge-oriented characterization of what is a priori. As standardly characterized, a priori knowledge is knowledge that does not depend on evidence from sensory experience. The previous considerations do not, however, settle the issue of whether every proposition knowable a priori is either necessarily true or analytically true.

A necessarily true proposition is not possibly false, or in Leibniz's words, is true in 'all possible worlds'. Contingently true propositions are possibly false, that is, false in some possible worlds. Traditionally, many philosophers have assumed that a proposition is knowable a priori only if it is necessarily true, presumably on the ground that if a proposition is possibly false, then it requires for its justification supporting evidence from sensory experience. Contingent truths, according to this traditional view, are not candidates for a priori knowledge.

Saul Kripke (1980) has argued that some contingently true propositions are knowable a priori. He cites the knowledge that stick *S* is one metre long at a certain time, where stick *S* is the standard metre-bar in Paris. If one uses stick *S* to 'fix the reference' of the term 'one metre', then, according to Kripke, one can know a priori that stick *S* is one metre long. The truth that stick *S* is one metre long is contingent rather than necessary; for *S* might not have been one metre long. (Application of sufficient heat to *S*, for instance, would have changed its length.) It seems arguable, then, that some contingent truths are knowable a priori, contrary to what many philosophers have assumed. This matter has prompted considerable discussion among contemporary philosophers, with some still contending that no contingently true proposition is knowable a priori. Some of the latter philosophers have noted, with regard to Kripke's example, that 'one metre' can be used either as (1) the name of the length of *S* whatever that length may be, or as (2) the name of a particular length singled out by a speaker. Given option (1), these philosophers hold, the claim that stick *S* is one metre long will be necessary and knowable a priori, and given option (2), the claim that stick *S* is one metre long will be contingent and knowable only a posteriori.

Many philosophers have held that a priori knowledge is restricted to such analytic truths as 'All rectangles have four sides' and 'All bodies are extended'. If such truths are analytic, they are true just in virtue of the meanings of their constituent terms. Such truths differ from synthetic truths, which are true in virtue of something other than just the meanings of their constituent terms (for example, in virtue of observable situations in the world). Synthetic judgments, according to Kant, are 'ampliative' in that they 'add to the concept of the subject a predicate which has not been in any wise thought in it, and which no analysis could possibly extract from it' (1781/1787: A7/B11). Some philosophers, notably W.V. Quine, have contested the viability of any philosophically important distinction between analytic and synthetic truths (see Quine, W.V. §3).

One issue of philosophical controversy is whether any synthetic truth is knowable a priori. Kripke's

aforementioned metre example offers, according to some philosophers, a synthetic truth knowable a priori. Kant held that some synthetic truths, for example, those of geometry, have a kind of necessity that cannot be derived from experience, and can be known a priori. Such synthetic truths, Kant argued, can be known independently of evidence from sensory experience. Kant's doctrine of synthetic a priori truths still generates controversy among philosophers, specifically in connection with such apparently synthetic propositions as 'Nothing can be green and red all over' and 'A straight line is the shortest path between two points'. The later Wittgenstein, for example, proposed that propositions of the latter sort are actually conventional 'rules of grammar', or non-synthetic normative standards for representation (see Necessary truth and convention).

2 Innate concepts, certainty and the a priori

Many philosophers deny that having a priori knowledge requires having innate concepts, concepts that do not derive from, or depend for their being understood on, sensory experience. (Some theorists, in the tradition of Platonism, hold that mathematical concepts, among others, are innate.) Propositions, one might suppose, consist of concepts, perhaps analogously to the way in which sentences consist of terms. Propositions knowable a priori, according to the philosophers in question, need not consist of innate concepts. The notion of a priori knowledge depends on a notion of a priori *warrant*, not on a notion of a non-empirical origin of the concepts constituting the known proposition. A notion involving special conditions for the justification of a believed proposition is not automatically a notion involving special conditions for either the origin or one's understanding of the belief in question.

The notion of a priori knowledge, construed as a notion of non-empirically grounded knowledge, is not the same as a notion of epistemic certainty. Philosophers have understood 'epistemic certainty' in various ways: for instance, as epistemically indubitable belief or as self-evident belief. A belief is epistemically indubitable if and only if it would not be epistemically justifiable to doubt that belief under any circumstance. It is not obvious that a priori warrant for a proposition requires epistemic indubitability of this proposition. A proposition's being warranted a priori for someone seemingly allows for an expansion of their relevant evidence, whereby a proposition justified on the original evidence ceases to be justified on the expanded evidence. (One might, for example, come to appreciate further implications of a proposition that was justified a priori.) A priori justification for a proposition apparently can be subject to 'epistemic defeat' given a change in a priori evidence (see Certainty; Doubt).

Philosophical talk of 'self-evidence' is often unclear. On a literal construal, a self-evident proposition is justified but does not depend on anything else for its justification. The problem in linking a priori warrant to such self-evidence is that a priori warrant is compatible with *inferential* warrant, wherein a proposition owes its warrant to inferential relations with other propositions, as might a theorem in a mathematical system. (It is a separate issue whether *all* a priori warrant might be inferential.) The notion of a priori knowledge should thus be explained independently of a literal construal of self-evidence. Other construals of self-evidence will contribute here only if they elucidate a notion of non-empirical warrant that differs from notions of necessary truth, analyticity and certainty as epistemic indubitability.

3 Prominent explanations of the a priori

Philosophers have long sought an account of the defining feature of truths that humans can know a priori. One result is a variety of accounts of the a priori in circulation. *Psychologism* about the a priori, advanced initially but later opposed by Husserl, claims that a true proposition is knowable a priori by humans if and only if our psychological constitution precludes our regarding that proposition as false. *Linguisticism* about the a priori, endorsed by A.J. Ayer and various other twentieth-century empiricists, states that a true proposition is knowable a priori if and only if our denying that proposition would violate rules of coherent language-use; this view denies the existence of synthetic a priori truths. *Pragmatism* about the a priori, advanced by C.I. Lewis, claims that a true proposition is knowable a priori by a person if and only if it describes their pragmatically guided intention to use a certain conceptual scheme of classification for the organizing of experiences. Lewis argued that pragmatic considerations regarding what suits one's needs guide the way in which one formulates a conceptual scheme. A different view, supported by Roderick Chisholm and many others, affirms that a true proposition is knowable a priori by us if and only if our understanding that proposition is all the evidence we need to see that the proposition in question is true. Yet another view about the a priori is suggested by the later writings of Wittgenstein: A

proposition is knowable a priori by us if and only if our 'forms of life' (that is, human nature as determined by our biology and cultural history) preclude the intelligibility for us of the denial of that proposition. (Wittgenstein did not offer a detailed account of 'forms of life' or of their role in determining what is a priori.) These are the most influential, but not the only, accounts of the a priori in circulation.

A theory of a priori knowledge should identify the strengths and weakness of the aforementioned accounts of the a priori. It should also identify the feature of a priori justification that requires limitation of the set of propositions knowable a priori to the distinctive kind of propositions specified by that theory. Such a theory must avoid confusing the notion of what is a priori with the notions of what is necessarily true, what is analytically true, what is innate, and what is certain. It must also draw a clear distinction between what is a priori and what is a posteriori.

‘Abduh, Muhammad (1849-1905)

The Egyptian reformer and Muslim apologist Muhammad ‘Abduh was a pupil and friend of al-Afghani. Although deeply influenced by him, ‘Abduh was less inclined to political activism and concentrated on religious, legal and educational reform. His best-known writings are a theological treatise, Risalat al-tawhid (translated into English as The Theology of Unity), and an unfinished Qur’anic commentary, Tafsir al-manar (The Manar Commentary), on which he collaborated with Rashid Rida. One of the key themes of these works is that since modernity is based on reason, Islam must be compatible with it. But ‘Abduh’s ‘modernism’ went hand in hand with returning to an idealized past, and his ‘rationalism’ was tempered by a belief in divine transcendence which limits the scope of intellectual inquiry. In ethics as in theology, he regarded the classical debates as arid and divisive, although on the issues of free will and moral law his position was in fact similar to that of the Mu‘tazila.

1 Faith and reason

‘Abduh trained as an *‘alim* (religious scholar) at al-Azhar where, under al-Afghani’s influence, he developed an interest in Islamic philosophy and a revulsion for traditional teaching methods which encouraged *taqlid*, the unquestioning acceptance of received opinion. The rational liberalism which he imbibed from al-Afghani was, however, only one facet of his thought. In his youth he was drawn to Sufism and, despite his subsequent attacks on popular superstition, he seems never to have lost his respect for those who in some conditions ‘have access in part to the ultimate mysteries and true insights into the visionary world’ (*Risalat al-tawhid*, in Musa‘ad and Cragg 1966: 97) (see Mystical philosophy in Islam). A third influence - the one which is dominant in the *Risalat al-tawhid (The Theology of Unity)* and the *Tafsir al-manar (The Manar Commentary)* - is that of the fourteenth-century Hanbalite jurist Ibn Taymiyya, who fuelled his desire to purify Islam of later accretions and return to the essentials of the faith as practised by the first generations of Muslims.

‘Abduh believed that Islam was the one true religion based on reason and revelation, but that in the course of time it had become distorted by various extrinsic factors. For instance, whereas the Qur’an fosters the scientific spirit by directing man to inquire rationally into the workings of the universe, the Islamic philosophers had uncritically accepted the theories of matter and physics propounded by Plato and Aristotle, with the result that the Islamic world had come to lag behind Europe in science and technology. His rejection of Greek philosophy in favour of modern science was, however, only partial. He accepted the distinction between necessary being, possible things and impossible things, using it to prove the existence of God. He also accepted the distinction between essences and accidents, arguing that reason gives us knowledge of the latter but not of the former. A corollary of this is that it is pointless for theologians to argue about the divine attributes because we cannot know their nature (see Islamic theology).

2 Ethics

On the issue of free will versus predestination, ‘Abduh’s starting point is the recognition that the man of sound mind is conscious of acts which stem from his volition:

> He weighs them and their consequences in his mind and evaluates them in his will, and then effectuates them by an inward power. To deny any of this would be tantamount to a denial of his existence itself, so opposed would it be to rational evidence.
>
> (*Risalat al-tawhid*, in Musa‘ad and Cragg 1966: 62)

However, ‘Abduh is equally insistent that all events in the world are ordered by God in accordance with his knowledge and will. He rejects further inquiry into how human freedom and divine prescience can be reconciled, on the grounds that such speculation is forbidden.

In discussing the moral law, ‘Abduh again begins with an appeal to common sense, arguing that we have no difficulty in recognizing our voluntary actions as good or bad in themselves or by reference to their particular or general consequences. If actions are self-evidently good or bad in the absolute way in which ‘Abduh alleges, however, it might be thought that religion is unnecessary. On the contrary, in matters of right and wrong, rational proof will not obviate conflict because people differ in intelligence, the vast majority being unable to understand

Platonic philosophy or Aristotelian logic. Moreover, because of its stress on God’s pleasure and wrath, religion has a greater impact on ordinary folk than the moralist’s claim that some acts are beneficial and others harmful. In any case there are some elements of the Qur’anic revelation which could not be known by unaided reason. These include the certainty of the afterlife, and the various ritual prescriptions.

All this is far-removed from the traditional Ash‘arite position. It is possible that here ‘Abduh was influenced by Mu‘tazilism as mediated by al-Afghani’s Shi‘ism, or less probably that we should detect the influence of Kantian philosophy. There seems little doubt, however, that his ethical thinking was moulded by the needs of apologetics. This is particularly clear in his essay on Islam and Christianity, in which he replied to Hanotaux, a French cabinet minister who had contrasted the Semitic mentality of Islam - with its transcendentalism, predestinarianism and contempt for individuals - with the Aryan humanism of Christianity, which through the Trinity raised human dignity to that of God.

Abelard, Peter (1079-1142)

Among the many scholars who promoted the revival of learning in western Europe in the early twelfth century, Abelard stands out as a consummate logician, a formidable polemicist and a champion of the value of ancient pagan wisdom for Christian thought. Although he worked within the Aristotelian tradition, his logic deviates significantly from that of Aristotle, particularly in its emphasis on propositions and what propositions say. According to Abelard, the subject matter of logic, including universals such as genera and species, consists of linguistic expressions, not of the things these expressions talk about. However, the objective grounds for logical relationships lie in what these expressions signify, even though they cannot be said to signify any things. Abelard is, then, one of a number of medieval thinkers, often referred to in later times as 'nominalists', who argued against turning logic and semantics into some sort of science of the 'real', a kind of metaphysics. It was Abelard's view that logic was, along with grammar and rhetoric, one of the sciences of language.

In ethics, Abelard defended a view in which moral merit and moral sin depend entirely on whether one's intentions express respect for the good or contempt for it, and not at all on one's desires, whether the deed is actually carried out, or even whether the deed is in fact something that ought or ought not be done.

Abelard did not believe that the doctrines of Christian faith could be proved by logically compelling arguments, but rational argumentation, he thought, could be used both to refute attacks on Christian doctrine and to provide arguments that would appeal to those who were attracted to high moral ideals. With arguments of this latter sort, he defended the rationalist positions that nothing occurs without a reason and that God cannot do anything other than what he does do.

1 Life

In comparison with most other medieval thinkers we know a great deal about Abelard's career, since he left an autobiographical essay entitled *Historia Calamitatum (The Story of My Misfortunes)*, which in effect recounts his life up to about 1132. He was born to a noble and very religious family in Le Pallet, near Nantes in Brittany, in 1079. Roscelin of Compiègne was one of his earliest teachers, and later in Paris he studied under William of Champeaux. In these years Abelard's main interest was logic, or dialectic as it was then called, which also included metaphysical issues such as the status of universals as well as psychological topics such as the role of images in thought. It was over the subject of universals that Abelard came into acrimonious conflict with William of Champeaux, and eventually he left Paris to set up his own schools nearby, first in Corbeil and later in Melun.

Having achieved a reputation as a subtle logician, Abelard moved on to study theology with Anselm of Laon, but here again he fell into competition with his teacher and even lured away some of his students. The stay at Laon was short, and by 1114 Abelard was back teaching logic in Paris. However, theology was to move more and more to the centre of his interests as his career progressed.

It was at this juncture that Abelard's famous romance with Heloise began. Heloise was only 17 but was well educated, thanks to the devotion of her guardian and uncle, Fulbert. It was by securing from Fulbert the job of teaching her that Abelard was able to pursue his amorous ends. Abelard confesses that during the height of their passion he was more given to writing love poems than studying logic. Heloise became pregnant, and Abelard took her away to his home in Brittany without Fulbert's permission. There she gave birth to their only child, Astrolabe. In order to reconcile himself to Fulbert, Abelard married Heloise and brought her back to Paris where she again lived with her uncle. The marriage was to have been kept secret in order not to endanger Abelard's career as a cleric, but Fulbert broadcast the news, with the result that Abelard had Heloise removed to a convent. Fulbert was so enraged by this that he hired thugs who attacked Abelard and castrated him. Subsequently, Heloise remained a nun for the rest of her life and became herself well known in this vocation. Abelard resumed his scholarly career after first entering the abbey of St Denis.

The next period of Abelard's life was intensely productive. His most important logical works, as well as the first version of his *Theologia (Theology)*, were probably produced while he was at St Denis. Some of his enemies, well placed in the church hierarchy, found in the *Theologia* what they took to be errors, and at a church council summoned in April 1121 in Soissons, Abelard's work was condemned (this condemnation was later revoked).

However, Abelard thrived on controversy, and from 1122 to 1127 he continued his teaching and work at a retreat in the country near Quincy. His reputation became even greater, and students from all over Europe flocked to his lectures on both logic and theology.

In 1127 Abelard accepted an appointment as the abbot of a monastery in Brittany known for its moral laxity. By this time he had become a strong proponent of church reform, especially in moral matters. His efforts to establish discipline at the monastery only angered the monks there, to the point where they tried several times to murder him. Eventually Abelard was relieved of these duties, and returned to Paris to teach at the school on Mont Ste-Geneviève.

Following the council at Soissons Abelard had revised his *Theologia* several times, but his doctrine of the Trinity as well as his view of sin again angered the church hierarchy, including the now very powerful Bernard of Clairvaux. In June of 1140, a council of bishops at Sens condemned several of his positions. Abelard's appeal to the pope was countered by Bernard, but eventually a reconciliation was arranged. Abelard died at Cluny on 21 April 1142.

Although in his own day Abelard was famous and influential, his impact on later generations was less than might have been expected. Peter Lombard's *Sentences*, which became the standard theological textbook in the thirteenth century, owed much to Abelard's *Sic et Non (Yes and No)*, and strong realism about universals was never an option after Abelard's attack; but many of Abelard's logical innovations were forgotten once the corpus of Aristotle's logic became available in the West. Abelard was hardly ever referred to after 1200, and a fellow nominalist like William of Ockham, writing around 1317, seems totally unaware of his work.

2 Works

In order to understand and assess Abelard as a philosopher, it is important to consider not only his works on logic but also his writings on theology. At risk of considerable over-simplification, his works may be divided into those composed before his stay in the community near Quincy (1122-7) and those written during and after that stay. As C.J. Mews (1985) has pointed out, this break seems to correspond with certain revisions Abelard made in both his logical and theological teachings.

In the earlier group lie his two great logical works, *Dialectica* and the *Logica ingredientibus (Logic for Beginners)*. The latter is really four works, consisting of glosses on four earlier and important logical works, Porphyry's *Isagōgē*, Aristotle's *Categories*, Aristotle's *Peri hermenias* or *De Interpretatione*, and on Boethius' *De differentiis topicis* (see Aristotle; Boethius, A.M.S.; Porphyry). These were interpretative commentaries on what was later called the 'old logic'. The *Dialectica* is an independent treatise roughly covering the same topics treated in the old logic, but without direct commentary. In theology, Abelard produced in the period before Quincy the version of his *Theologia* known as the *Theologia 'summi boni' (Theology of the Highest Good)* and the collection of conflicting passages from scriptures and earlier church fathers and doctors known as the *Sic et Non*.

After he moved to Quincy, Abelard's *Theologia* went through several revisions, resulting in a long work divided into five books now referred to as the *Theologia Christiana (Christian Theology)*. A final reworking of his theological ideas in shorter form is found in the *Theologia Scolarium (Theology for Students)*. Also in the area of theology from the later period is his *Dialogus inter philosophum, Iudaeum et Christianum (Dialogue of a Philosopher with a Jew and a Christian)* and his *Ethica* or *Scito te ipsum (Ethics, or Know Thyself)*. Abelard's work in logic seems to have diminished in the post-Quincy period, but he did compose a new and important gloss on Porphyry's *Isagōgē* called the *Glossule super Porphyrium* or *Logica 'nostrorum petitioni sociorum' (Logic in Response to the Request of Our Comrades)*, probably while at Quincy. Because of this diminishing interest, Abelard never made much use of the 'new logic', that of Aristotle's *Analytics*, *Topics* and *Sophistical Refutations*, which became available in western Europe in the 1130s (see Translators).

3 Pagan wisdom and Christian faith

Abelard was, at least in his later life, a devout Christian committed to the moral reform of the church and the defence of traditional orthodox Christian beliefs. However, he was also well read in the literature of pagan Greece and Rome, and was convinced that among the works of the philosophers of the ancient world could be found useful models of moral life and more precise understandings of dogmas such as the Trinity than were to be found

even in the Old Testament. His *Theologia* evidences an overriding concern to defend the use of pagan learning in explicating and defending the Christian faith, while at the same time refuting 'pseudo-philosophers' who in his own day were creating difficulties for belief by misusing that most important legacy of the ancients, logic.

Abelard found that the ancient philosophers, although they had lived before the time of Christ, had already taught some of the most important doctrines of the Christian religion, namely the immortality of the soul, the existence of a creator, the supreme importance of living virtuously, the likelihood of retribution in the next life for sins in this one and even, in Plato's case, the doctrine of the Trinity (see Plato; Trinity). It was not Abelard's view that the ancient sages came to these insights simply by the use of reason and other natural cognitive faculties; rather, he held that God had given them a certain revelation as a reward for their exemplary lives.

4 Logic

Abelard's actual knowledge of ancient philosophy outside of ethics was very limited and was often reliant on the fragmentary accounts of it given by early Christian thinkers such as Augustine. In the field of logic he at least had translations of a few primary sources, such as Aristotle's *Categories* and *Peri hermenias* and Porphyry's *Isagōgē*. Also in his possession were the commentaries of Boethius on these sources, as well as a few of Boethius' own treatises. The rest of Aristotle's logical works became available only late in Abelard's life, after his own interest in logic had waned. In this legacy Abelard's genius discovered many difficulties and omissions, and his reflection on these led him to develop a quite original logical theory, even though he always presented it as an extension and modification of the traditional Aristotelian framework.

Perhaps the most un-Aristotelian feature of Abelard's logical theory is the central role he gives to sentences and what sentences say, rather than to terms. Any sentence, even a question or an imperative, says or proposes something called a *dictum*, although only assertions commit the speaker to the truth of what is said. These *dicta* are the primary subjects of truth and falsity, with assertions being true or false only insofar as their *dicta* are. Abelard recognizes that the genuine contradictory of an affirmative sentence is one in which the negation operates on the whole *dictum* of the latter, not just on the predicate. His elaborate theory of conditionals rests on the view that a conditional is true only when the truth of the antecedent's *dictum* requires the truth of the consequent's *dictum*. We have here the makings of a genuinely 'propositional' logic akin to that developed in ancient times by the Stoics, that is, a logic in which the basic logical relationships of entailment, opposition and so on are seen as holding between propositions (see Stoicism).

Abelard's appreciation of the saying-function of sentences leads him to a very original analysis of what is involved in verbs, and in the verb 'to be' used as a copula. The tendency of Aristotelian logic is to view simple categorical sentences as having three parts: two noun phrases linked by some form of the copula. Thus 'Socrates is a human' has as its parts the noun phrases 'Socrates' and 'a human', plus the copula 'is'. Abelard, on the other hand, sees such sentences as falling into two parts, a subject noun phrase and a predicate verb phrase. The peculiar function of the verb is thus to provide the saying-force, without which the string of words would be at best a list rather than an assertion. The copula really has no signification on its own, but merely acts to transform a noun phrase into a verb.

Nouns, he thinks, turn out to be implicit verbs, as can be inferred from their covert importation of tense. In 'Some man is a philosopher' 'man' extends over only presently existing men, so that the whole sentence really means 'Something which is now a man is a philosopher', where the verb implicit in the subject is made explicit. Although nouns often have 'appellation' - for example, in many contexts they are taken as applying to or naming certain individual things - these things are nevertheless not what the noun signifies. Signification has both a psychological and more properly a semantic aspect. The former will be discussed later, but as for the latter, Abelard refers to *status* or 'natures' as what is signified by both verbs and nouns. These are apparently referred to by verbal nominalizations such as 'being a man' or 'walking'. Perhaps the best way to view a *status* is as that which, in a *dictum*, corresponds to the predicate of the corresponding sentence, for Abelard talks in much the same way about *status* as he does about *dicta*. Thus a *status* or nature associated with a predicate is what might be said of some thing by using that predicate in a sentence in which the subject noun named that thing.

Status and *dicta* turn out to be important both for Abelard's analysis of modal propositions and for his treatment of conditionals. A modal proposition, such as 'It is possible for this man, who is sitting, to be standing', turns out to

have a false sense in which the whole *dictum* of the sentence ‘This man, who is standing, is sitting’ is the apparent subject of the modality, and another true sense in which what is being asserted is both that standing is compatible with the *status* of being a man and that the man in question is in fact sitting. Conditional propositions are necessarily true only if the *dictum* of the antecedent explicitly or implicitly contains the dictum of the consequent. Necessarily true conditionals such as, ‘If there is a rose, there is a flower’, the truth of which depends simply on the logical relationship between the natures of being a rose and being a flower, are sometimes called ‘laws of nature’ by Abelard and are fundamental for science (see Language, medieval theories of; Natural philosophy, medieval §§8-9).

5 Ontology

Although Abelard never had a kind word for his old teacher Roscelin and the two quarrelled bitterly over matters of theology, it is clear that the student in large measure took over his master’s view that logic is about vocally produced sounds qua signifiers, not about the things those sounds may be used to refer to. Such a view sharply separates logic from sciences such as physics, which talk directly about things without regard to any use of them as signifiers. Instead, physics treats logic as a tool which can be of help in any inquiry that employs language. Abelard conducted a vigorous attack on ‘realist’ views of logic, such as that held by William of Champeaux. This dispute focused on ‘universals’, for example, items such as genera and species (that is, the items which Aristotle claimed were each predicated of many subjects by true affirmations), since these were crucial to Aristotelian logic and science. As viewed in Abelard’s day, the issue was whether universals were things existing independently of language (realism) or whether they were only the words that referred to things (nominalism). Abelard came down clearly on the latter side (see Nominalism; Realism and anti-realism; Universals).

William’s version of the realist position treated genera and species as something like materials common to many things. The different things they are common to are differentiated by opposed forms which also exist in these materials. Abelard argued that the end result of this view is that one and the same individual thing may have opposed characteristics at the same time. Abelard’s own positive view shifted somewhat from that of his *Logica ingredientibus*, where it is simply the vocally produced physical sound (the *vox*) which is a universal, and that of the *Logica ‘nostrorum petitioni sociorum’*, where it is words (*sermones*) that are universals and different words might share the same physical sound. However, the basic idea remains: universality results from some thing being used as a sign of many.

Where Abelard’s view differs radically from that of his teacher Roscelin is in the role of the *status*. Abelard claims that the *status* ‘being a human’ is the reason why the term ‘human’ applies to the many things to which it does apply; but, he says enigmatically, this is ‘no thing’. Nevertheless it is that which verbs, and nouns, signify. Do they signify, then, without signifying anything? In the *Logica ‘nostrorum petitioni sociorum’*, Abelard explains that through the idea associated with a universal word there does not have to be some particular thing that one thinks of when one uses the word. For example, in just the way that there does not have to be some thing that I want when I want a hood - in other words, I can want a hood without there being any particular thing that I want - similarly I can think of something through the idea associated with ‘human’ even though there is no particular thing (or human) that I think of.

Dicta, too, turn out not to be things. Abelard thinks it would make the necessity of any conditional proposition incomprehensible if we thought of the *dicta* of the antecedent and consequent as things. Nevertheless, his whole semantic theory is deeply dependent on talk about both *status* and *dicta*. Even in his theory of the Trinity, without *status* he has no grounds on which to defend the objective differentiation of the three divine persons. Apparently Abelard thought it was possible to evade the embarrassing ontological consequences of a ‘realist’ approach to logic while retaining all the advantages of an approach which bases logic in objective facts, for, as discussed below, he eschews the idea of founding logic on relations between mental entities such as ideas or concepts. Perhaps the chief conundrum for interpreters of Abelard is how this is supposed to be possible.

Abelard also introduces here the concept of ‘impersonal’ propositions wherever there is a statement of grammatical subject-predicate form but the subject is the nominalization of a verb phrase or a sentence (see above). Since neither verb phrases nor sentences name anything, Abelard thinks it is a mistake to take their nominalizations as nonetheless naming something. It is not just that ‘being a human’ fails to name a thing; it doesn’t name at all. Nouns like *status* and *dictum*, since their use is based in their being predicated of items like

being a human and Socrates' being a human, likewise do not really name at all. Is this tantamount on Abelard's part to saying that the language in which we talk about the foundations of logic necessarily escapes the scope of the very logic about which it is designed to talk? A full study of the implications of Abelard's logic has yet to be written.

Another area of ontology in which Abelard was very inventive concerns the doctrine of sameness and distinctions. While defending the doctrine of the Trinity, Abelard was led to develop the idea that items might be the same 'essentially' even though some predicates true of one are not true of the other, because the items are distinct 'in property'. An example is the way that a wax statue is the same 'essentially' as the wax that composes it; but the statue is not the matter for the statue, even though the wax is. This same idea lies behind the distinction of words from the physical sounds in which they are realized. The word is the same 'essentially' as the sound, but nevertheless two words might be the same as one vocal sound and yet not the same as each other.

6 Psychology of signification

Although logic is about words that are realized in sound, Abelard acknowledges that those sounds constitute words and thus have properties significant for the logician only because they express ideas in the mind of the speaker. His views on the mental side of signification are fairly elaborate and reflect his careful reading of Aristotle's *Peri hermenias*.

The fundamental notion here is that of an 'idea' (*intellectus*), which is a genuine mental thing, an act or a disposition toward a mental act. The idea is not the content of such an act, but rather the idea itself always has some content. Only beings with reason can have ideas and thus ideas must be distinguished from both sensings and imaginings. Abelard locates this distinction in the way an idea isolates some property for attention, while sensings and imaginings grasp something without separating out some single property or complex of properties of that thing from its other properties. In other words, any idea reflects a certain abstractive thought process. What is isolated and thought of through the idea is some *dictum* or *status*: in other words, what is signified by the word or words which express the idea in question.

Abelard often talks of linguistic expressions as signifying the ideas they express, but he makes it clear that this sense of 'signification' is not one which permits inferring that language necessarily talks about ideas. He is very insistent that we must avoid a semantic theory which would have all language ultimately be about something in the mind. This applies also to the images which the mind creates in order to give itself something to focus on when it thinks. Abelard does not think that these images are mental things in the way ideas are; indeed, they are not 'things' at all. My image of a four-sided tower is not a four-sided thing which exists, either in my mind or in external reality. Such images cannot be equated with what words signify, since, Abelard claims, we can use exactly the same image when we use words with different meanings. The 'attention' of the mind allows us to focus on one property at one time and another at another time, in both cases using the very same image. The image is not the content of the idea that uses it.

The contents of ideas, then, are the *status* or *dicta* which are the 'things' (as opposed to the ideas) which words signify. Since, as noted above, *status* and *dicta* are not themselves things, Abelard's position here teeters on the brink of self-contradiction. However, he argues vigorously that we need not always find some thing for our terms to signify. When I am thinking of a man, I need not be thinking of any particular man. In the sentence 'A man is in the house' 'a man' does not signify any particular man, not even the one which happens to be in the house, if such a person exists. Abelard is keenly aware that noun phrases in certain contexts are used 'non appellatively', in other words in such a way that one cannot point to any particular thing and say that it is the referent of the phrase. His observation here clearly dovetails with the view mentioned in §5, that an idea can be of something even though there is no particular thing it is of, and is thus part of Abelard's perhaps dubious way of avoiding the apparent ontological implications of his semantics.

7 Ethics

Abelard's positions on ethical questions were heavily influenced on the one hand by what he knew of Stoic ethics, and on the other hand by the Christian doctrine of rewards and punishments in the next life for righteousness or sinfulness in this one. Stoic ethical doctrines were accessible to Abelard through the writings of Cicero and

Seneca, as well as through the detailed accounts of Stoic ethics in the writings of Augustine and other church fathers. His views largely amount to an attempt to take the Stoic doctrine of moral virtue and vice and make it the basis of how God judges souls to be meritorious (deserving of eternal blessedness) or guilty (deserving of damnation). In the course of this effort, however, a number of important notions are drastically redefined.

Whereas in the Stoic view virtues and vices were settled practices of deliberately choosing good and bad courses of action, for Abelard they are inclinations which manifest themselves prior to choice and over which we have little control. In his view, a tendency to get angry too easily is a vice, but having that vice does not of itself make one sinful and deserving of punishment. It is deciding to yield to that tendency that is sinful. In Abelard's view, then, there is no logical inconsistency in supposing that a person has many vices but is in fact a very righteous person deserving of God's rewards. In fact, Abelard says, having vices to fight against is required in order to attain the highest merit. The person who has nothing but virtues easily does the right thing and thus merits reward less.

Neither does Abelard think that sin or righteousness lies merely in willing something. Here his view changed somewhat over time, but in his *Ethica*, probably a late work, he adopts a conception of a will which equates it with a desire, not with any deliberate decision to undertake some course of action nor with a mere faculty for such decisions. On this point Abelard was clearly not in accord with earlier writers such as Augustine and Anselm. Given such a definition of will, Abelard has no trouble showing that a person can have a will to do something they should not and yet not sin, and also sin while not having any will for doing something they should not. The first case is illustrated by a man who lusts after a married woman but restrains himself and never adopts the intention to seduce her. The second is exemplified by a servant who kills his master in self-defence; he never willed the death of his master but rather only desired his own life, a perfectly legitimate will. And yet (on Abelard's very rigorous moral standard) he sinned in not allowing himself to be killed rather than engage in a killing.

Once the firm intention to do wrong is formed, however, the guilt exists, and it is not increased by the actual performance of the deed. Thus Christ can rightly condemn men for having committed adultery in their hearts even if they have not actually seduced a woman. Sin, in Abelard's view, lies entirely in the consent to do what one knows one should not, or to omit doing what one knows one should. (The men Christ condemned, Abelard believes, had consented to such a seduction; they had not merely lusted after the woman.) This alone makes one guilty and deserving of retribution from God. That sinners must know they are wrong is important for Abelard. One of the theses which the bishops at the council of Sens objected to was Abelard's claim that, because they thought they were doing what they were supposed to do, the men who crucified Christ were not guilty. The consent or intention to do something may be objectively bad - what one consents to may in fact be something one ought not consent to - and yet, because of the ignorance of the person who consents, no guilt be incurred. The consent is sinful when and only when it amounts to contempt for what is good and right, which Abelard often equates with contempt for God. Likewise, a consent is meritorious only when it shows respect and love for what is good, in other words, for God (see Sin).

Although sin is the only thing that makes one deserving of punishment, both divine and human punishment can in certain circumstances be justifiably visited on those who do not deserve it. Abelard describes a case where a woman, who was only trying to keep her baby warm, accidentally smothered it to death. The judge, he says, is justified in punishing her in order to set an example that will remind others to be more careful. Human justice, he claims, is legitimately more concerned with outward deeds than with inner intentions, since it is the former, not the latter, that directly affect the peace and welfare of the community. Similarly, Abelard allows the doctrine that, for obscure reasons of his own, God is justified in condemning to eternal death some unbaptized infants who have never sinned.

8 Theodicy

Abelard argues for God's existence as follows. We recognize that we ourselves are not made by ourselves but by something else; however, we as rational beings are certainly superior to the world of non-rational things. This would not be so if that world were something that caused itself, because anything which relies only on itself for its subsistence is superior to anything that relies on something other than itself. Hence that world is brought into existence by something else, a maker or ruler, and this we call God (see God, arguments for the existence of).

Abelard recognizes that logically this argument is less than completely compelling, but he thinks that in this area

we should accept those arguments which make an appeal to our better sentiments. His attitude here reveals how far Abelard was from developing theology as a branch of rational philosophy or metaphysics in the way that would be attempted later, in the thirteenth century (see Aquinas, T.).

One conclusion that Abelard reached on the basis of such arguments was that everything that is or occurs has a reason for being or occurring. To allow otherwise would be to claim that there are some things that God either makes occur or allows to occur, without having a full reason for why these rather than other things should occur. This Abelard thinks would detract from the divine goodness. On this basis, Abelard draws the conclusion that God could not do or omit anything other than what he at some time does do or omit. He will not allow that God might be faced with several alternatives which are equally best, so that there could be no reason for him to choose one rather than the other. And, of course, God cannot choose an alternative to which there is a better alternative. From God's point of view, then, all that he does or omits he must do or omit (see Omnipotence). This view too was among those condemned at Sens, and Abelard admitted that few agreed with him on this subject. Although he cleverly used his theory of modalities to argue otherwise, the position seems clearly headed toward fatalism of the Stoic variety. That Abelard proposed such a view at all shows to what extent he was attracted by the extreme rationalism represented in ancient Stoicism.

MARTIN M. TWEEDALE

List of works

Abelard, P. (*c.*1120?) *Logica ingredientibus (Logic for Beginners)*, ed. B. Geyer in *Peter Abaelards Philosophische Schriften (Peter Abelard's Philosophical Writings)*, Beiträge zur Geschichte der Philosophie des Mittelalters 21, Heft 1-3, Münster: Aschendorffschen Verlagbuchhandlung, 1919-27.(The most important Latin text for Abelard's logic. The *Gloss on Porphyry* has been translated by Paul Spade in *Five Texts on the Medieval Problem of Universals: Porphyry, Boethius, Abelard, Duns Scotus, Ockham*, Indianapolis, IN: Hackett, 1994, pages 26-56.)

Abelard, P. (*c.*1120?) *Dialectica*, ed. L.M. de Rijk, Assen: Van Gorcum, 1970.(After the previous work, the most significant of Abelard's philosophical writings.)

Abelard, P. (*c.*1124?) *Logica 'nostrorum petitioni sociorum' (Logic in Response to the Request of our Comrades)*, ed. B.Geyer in *Peter Abaelards Philosophische Schriften (Peter Abelard's Philosophical Writings)*, Beiträge zur Geschichte der Philosophie des Mittelalters 21, Heft 1-3, Münster: Aschendorffschen Verlagbuchhandlung, 1919-27.(A short piece on Porphyry's *Isagōgē*, that reviews the earlier gloss in the *Logica ingredientibus*.)

Abelard, P. (*c.*1120?) *Theologia 'summi boni' (Theology of the Highest Good)*, ed. E.M. Buytaert and C.J. Mews in *Petri Abaelardi Opera Theologica* III, Corpus Christianorum, Continutatio Mediaevalis XIII, Turnholt: Brepols, 1987, 39-201.(The first version of Abelard's *Theologia*.)

Abelard, P. (*c.*1125?) *Theologia Christiana (Christian Theology)*, ed. E.M. Buytaert in *Petri Abaelardi Opera Theologica* II, Corpus Christianorum, Continuatio Mediaevalis XII, Turnholt: Brepols, 1969, 5-372.(The second and most complete version of Abelard's *Theologia*, including his doctrine on the Trinity.)

Abelard, P. (*c.*1135?) *Theologia Scolarium (Theology for Students)*, ed. E.M. Buytaert and C.J. Mews in *Petri Abaelardi Opera Theologica* III, Corpus Christianorum, Continuatio Mediaevalis XIII, Turnholt: Brepols, 1987, 203-613.(The third version of Abelard's *Theologia*.)

Abelard, P. (*c.*1125?) *Dialogus inter philosophum, Iudaeum et Christianum (Dialogue of a Philosopher with a Jew and a Christian)*, ed. R. Thomas, Stuttgart-Bad Cannstatt: Frommann, 1970; trans. P.J. Payer, Toronto, Ont.: Pontifical Institute of Mediaeval Studies, 1979. (Abelard's attempt to view Christianity as much more in line with ancient philosophy than was Judaism.)

Abelard, P. (*c.*1138?) *Ethica (Ethics)* or *Scito te ipsum (Know Thyself)*, ed. and trans. D.E. Luscombe in *Peter Abelard's Ethics*, Oxford: Clarendon Press, 1971.(Contains Abelard's fullest explanation of the doctrine of sin.)

Aberdeen Philosophical Society

The Aberdeen Philosophical Society (1758-73) played a formative role in the genesis of Scottish common sense philosophy. Its founder members included the philosopher Thomas Reid and the theologian George Campbell. Its discussions favoured the natural and human sciences, particularly the science of the mind, and one of its central concerns was the refutation of the work of David Hume.

Popularly known as the ’Wise Club’, the Aberdeen Philosophical Society was founded in January 1758 by a core group of six men that included the philosopher Thomas Reid and the theologian George Campbell. The Society initially brought together individuals who were either associated with the two Aberdeen colleges or connected with the local political magnate, Lord Deskford. During the next decade, figures such as Alexander Gerard and James Beattie joined the club, and the Society became a respected body within the European republic of letters because of the growing reputation its leading members had achieved through their publications. However, by the late 1760s the Society was in decline, and it finally dissolved in 1773 due to internal divisions caused by college politics.

Unlike other prominent Scottish groups of the period, the Wise Club carefully circumscribed the scope of its proceedings. According to its constitution the Society was to exclude the discussion of the traditional scholarly fields of grammar, philology and history, and limit itself to ’philosophical’ subjects. Under this rubric the founding members included reports on matters of fact, inductive generalizations concerning the phenomena of the material and mental realms, disquistions on false theoretical systems and erroneous methods of philosophizing, and the exploration of the relations between philosophy and the practical arts. Consequently, the Society focused largely on topics drawn from the natural and human sciences, and rarely touched on the literary and artistic questions which interested many of the other polite clubs of the Scottish Enlightenment (see Enlightenment, Scottish). The most popular subject for discussion was the anatomy of the mind, particularly as it related to morals. Other areas canvassed at meetings included politics, education, political economy, mathematics, natural philosophy, natural history and agricultural improvement. Thus, like most provincial clubs of the eighteenth century, the Aberdeen Philosophical Society covered a broad spectrum of topics, but the scientistic approach to moral philosophy which it espoused was rooted in the local philosophical tradition initiated by the moralist George Turnbull.

Although their debates ranged widely, the members of the Society were centrally concerned with the refutation of the writings of David Hume. One of the club’s founders, Robert Trail, had earlier criticized Hume in a sermon published in 1755, and his fellow members subsequently took up the charge. Alexander Gerard and George Campbell attacked Hume’s critique of religion; while Thomas Reid, John Farquhar and James Beattie among others challenged various aspects of his epistemology. The Society therefore functioned as a forum for the articulation of a common-sense reponse to Humean scepticism, and Thomas Reid did not exaggerate when he wrote to Hume in 1763 that ’If you write no more in morals, politics, or metaphysics, I am afraid we [that is, the Wise Club] shall be at a loss for subjects’ (Ulman 1990: 57).

Abhinavagupta (*c*.975-1025)

Abhinavagupta was a Kashmiri philosopher, theologian and early exponent of the Hindu Tantra, often counted as the most illustrious representative of the nondual Śaivism of Kashmir. Author of influential Sanskrit works dealing with the philosophy of recognition and the theological interpretation of the Śaivite scriptures, including the encyclopedic Tantrāloka (Light on the Tantras), he also wrote definitively on Indian aesthetic theory. The tradition of the nondual Śaivism of Kashmir gathers up the teachings of several related lineages of northern Śaivite philosophers which developed in Kashmir between the ninth and thirteenth centuries, such as Vasugupta, Kallaṭa, Somānanda and Utpala. Basing his writings on these authors as well as on revealed texts, Abhinavagupta propounds a tantric alternative to the restrictive and orthodox Mīmāṃsā and elaborates a challenge to the later mainline Vedānta. He offers the earliest theoretical bases for a complex and sophisticated Hindu Tantra based on the notion of Śiva as the nondual and all-pervading consciousness. His writings highlight the centrality of the Goddess as the Śakti *or power of consciousness. Abhinavagupta elaborates the ritual and meditative methods for the experiential and blissful recognition of Śiva as the intrinsic self-identity of the practitioner.*

1 General context and life

Abhinavagupta is considered to be one of the most sophisticated and enduringly definitive theoreticians of the medieval Hindu Tantra. His work as a theoretician of the Hindu Tantra and as an interpreter of the revealed scriptures of Śaivism is intertwined with his life as a devotee of Śiva. Abhinavagupta's contributions to the philosophy of language and as a philosophical interpreter of aesthetic theory remain definitive. His tantric synthesis is termed the Trika-Kaula because it skillfully melds together doctrinal and ritual elements drawn from these two Śaivite preceptorial lineages.

Abhinavagupta (*c*.975-*c*.1025) was born to a rich and noble Brahman family residing in the city of Śrinagar. His mother, Vimalā, died when he was still young and her death affected him greatly. The family were devotees of Śiva and Abhinavagupta matured in an atmosphere charged with religious devotion and dedication to learning. He began his studies with his learned father, Narasimhagupta, but quickly began visiting teachers in Kashmir and elsewhere. While he was studying literature and poetry, he was overcome with an intoxicating devotion to Śiva. After this, he studied everything he could: traditional texts of the dualistic and monistic Śaivism, literature, drama and aesthetic theory, Indian philosophical thought and the various branches of Śaivism. He also studied with Buddhist and Jaina teachers. His love of learning and spiritual search led him to Jālandhara where he encountered the tantric master, Śambhunātha, who initiated him into the practices of the Kaula tradition.

This early period of study and spiritual practice lead to a mature life dedicated to the absorption of knowledge in an atmosphere of extreme religious fervour. He never married, and spent his life living in the homes of his many teachers. At the height of his fame, he was revered as an authoritative and charismatic tantric master whose authority as guru or teacher was enhanced by the fact that he was considered to be a *mahāsiddha* (perfected and accomplished mystic). Twenty-one of his works are extant and there are references to titles of twenty-three others now apparently lost. His primary disciple was Kṣemarāja who wrote works applying his master's teachings. We have no definitive information about Abhinavagupta's death. Local Kashmiri legend has it that the great master walked into a cave with 1,200 of his disciples and simply disappeared.

Given his deep erudition, the intellectual context of Abhinavagupta's writings is very broad, in part due to his relatively late date with regard to the earlier traditions of Indian philosophy and religion. In addition to the revealed Hindu literature and to the texts produced by his predecessors in the Śaivism of Kashmir, Abhinavagupta's work resonates with practically all that precedes him in Indian thought, including the traditional brahmanical or Vedic literature, the debates of the philosophical traditions, the mysticism of the Yogis, the various Bhakti traditions and the varieties of Buddhist and Jaina philosophical discourse.

2 Śiva's nonduality

From a doctrinal point of view, Abhinavagupta's articulation of the nondual Śaivism of Kashmir is to be distinguished philosophically by its assertion that what is termed 'Śiva', the absolute and primordial consciousness, is nondual. Moreover, this nondualism differs in important ways from the Vedāntic *advaita*. For the

Kashmiri nondual Śaivites, the nondualism or Śiva does not in any way imply that the world and all who dwell in it are illusory. On the contrary, Abhinavagupta asserts that this world is real precisely because it is only Śiva, the absolute consciousness. However, this assertion of the reality of the world does not fall into a position of naive realism. Rather, it seeks to articulate the enlightened and transformed vision of the mystic for whom the paradoxical omnipresence of Śiva has become a tangible experience. Thus, Śiva's nonduality allows without contradiction for the arising of duality and diversity within it. In addition, Abhinavagupta's expression of nondual Śaivism places emphasis on the ultimate power (*śakti*) that abides inseparably with the absolute consciousness. Alhough one, this transcendent power of consciousness has many faces: the powers of freedom, of grace or revelation and of manifestation or concealment.

This doctrine resides at the very core of Abhinavagupta's entire intellectual production, which is large in scope and has not been fully explored by scholarship. Often, facets of his intellectual production have been characterized in a piecemeal fashion, text by text, or in terms of the various initiatory lineages (rather than schools), thought to determine the content of individual texts. However, there is another, more general way to approach Abhinavagupta's work. In philosophical terms, we find in it three connected although differentiable intellectual agendas which are best characterized in terms of the mode of knowledge that predominates in each of them: inference, revealed scripture and enlightened knowledge. Each of these agendas articulates an aspect of this core doctrine of Śiva's nonduality.

3 Philosophy of recognition

Abhinavagupta's first intellectual agenda revolves around the philosophical interpretation of the doctrine of recognition. His writings on the 'school' of recognition, primarily in the *Īśvarapratyabhijñāvimarśinī (Commentary on the Recognition of the Lord)*, are systematic philosophical exposition and argument. An appeal is made to the authority of good reasoning, and arguments through inference are employed as the primary mode of philosophical discourse. The major audience seems to have been external, for these are primarily polemical works of intellectual debate aimed at philosophical opponents.

Abhinavagupta's writings on the philosophy of recognition are continuous with the debates put forward by the philosophers of Nyāya-Vaiśeṣika, the Mīmāṃsā, the Advaita Vedānta, the schools of Buddhist logic and the traditional Grammarians (see Mīmāṃsā; Nyāya-Vaiśeṣika; Vedānta). Buddhism was a vigorous presence in the Kashmir of Abhinavagupta's time. While his opponents in these texts include proponents of Sāōkhya, as well as Vaiṣṇavas and Jainas, his primary philosophical arguments were aimed at the Buddhist logicians (see Sāōkhya). The Buddhists marshalled arguments against the primary categories of the Śaiva philosophy including the notion of the self, the idea of the Lord, the *śakti* and the manifested universe (see Buddhist philosophy, Indian).

In his works on recognition, Abhinavagupta elaborates closely reasoned arguments to counter the Buddhists' criticisms. He points to the notion of Śiva as the absolute consciousness and posits a reality that is totally free, completely unbounded and blissful in its intrinsic nature. This he says is the reality of consciousness, saturated with power (*śakti*) of at least five different kinds: the powers of consciousness, bliss, will, knowledge and action. It is this absolute consciousness surcharged with power that both dwells within all beings as their true nature and mutates to appear as the forms composing the manifest universe.

Abhinavagupta contends that it is because of doubt that the recognition of this omnipresent consciousness does not take place. Consequently, his philosophy of recognition is meant to present the good reasoning that will remove doubt. This precipitates the process of recognition of what is already the case, namely, that the self is in fact the powerful Lord, filled with *śakti* and creative of the visible universe.

This initial description of an absolute consciousness reveals the shape of a problematic in Abhinavagupta's work that bridges philosophy, theology and mysticism. Ordinary human awareness and perception do not reveal that an absolute consciousness is operative either as the inner reality of the self, or as the underlying reality of the visible and manifest universe. Therefore, Abhinavagupta is concerned to show why this is the case: that is, how and why the obscuring of the absolute takes place and how and why the absolute comes to be revealed. The first of these questions involves Abhinavagupta in descriptions of the nature of bondage and contraction, involving a series of limiting sheaths and impurities. The second leads him to a discussion of tantric metaphysics and mysticism.

4 Tantric metaphysics and mysticism

The second major agenda found in Abhinavagupta's works is what might be called a systematic theology of the Hindu Tantra. This is best exemplified by his *Tantrāloka (Light on the Tantras)* where he interprets the tantric metaphysics and esotericism of the revealed scriptures, particularly the *Mālinīvijayottara Tantra*. In this aspect of his works he writes as an authoritative religious and theological exponent of Śaivism. His appeal is to the authority of revealed scripture, which must be systematically interpreted in the light of reason and spiritual insight so that apparent contradictions may be rationalized. The major audience for this aspect of his work were the varied schools of Śaivism prevalent in the Kashmir of his day. Thus, his mode of discourse is that of religious theology and the systematic exposition of the doctrines of Śaivism.

The themes taken up in the *Tantrāloka (Light on the Tantras)* (and elsewhere in Abhinavagupta's Śaivite theology) are complex and detailed. One strand of discourse explores the contraction of the ultimate consciousness and the manifestation of the world in terms of an emanationist scheme composed of thirty-six progressively more manifest principles of reality (*tattvas*). Another important strand centres on a mysticism of the Word, filled with vibration and dwelling in unity with the absolute consciousness at the transcendent level of reality. This supreme Word of consciousness is termed the supreme mantra *aham* (I am) and it is understood as the perfectly full and blissful egoity.

The third major intellectual agenda in his works might be called a practical theology or mysticism of Śaivism, encountered primarily in his elaboration of Kaula mysticism in his *Parātriṃśikāvivaraṇa (Longer Commentary on the Thirty Verses on the Supreme)*. Here, Abhinavagupta advances interpretations of the many Śaivite lineages into which he had been initiated as well as offering interpretations of the meanings of tantric ritual and practice. The appeal is to the authority of his own enlightened experience, and the audience seems to have been primarily his own initiated disciples whom he was addressing in the role of spiritual teacher.

A central concern in this dimension of his work is the elaboration of the meaning of *jīvanmukti* (liberation while still alive) in terms of the mystical experiences of the yogin, who, by penetrating the core of that absolute consciousness, achieves identity with Śiva and experiences the universe as continuously unfolding and being reabsorbed into his own consciousness.

Abhinavagupta's discussion of tantric initiation includes a long clarification of the descent of the energy of Śiva's grace. In addition, he elaborates the intrinsic meanings of the great variety of rituals in the Hindu Tantra linked to an elaborate pantheon of tantric deities. The primary hermeneutical move throughout is one of interiorization and of interpretation in terms of the mechanics of an overarching consciousness. Thus, while the earlier tantric tradition will speak of external goddesses who are to be appeased by a variety of transgressive offerings in the tantric ritual, Abhinavagupta will consistently recast these goddesses as the forces of the absolute consciousness present in the depths of the practitioner's own being.

Abhinavagupta's core statements about Śiva modulate into an ambitious and multivalent intellectual and theological enterprise. This enterprise will also allow him to put forward an innovative interpretation of aesthetic theory that posits an analogy between the absorption of the yogin and the refined aesthete's delectation of the experience of art. Abhinavagupta's work will have manifold direct and indirect influences on all that follows him in the subsequent evolution of the Hindu Tantra.

Abravanel, Isaac (1437-1509)

Abravanel is often seen as having a unique position in Jewish philosophy, between the end of the Middle Ages and the beginning of the Renaissance. His ideas point both to the past - especially to Maimonides - and to the future, in his approach to the questions of history and of authority in the state. His defence of what he takes to be religious orthodoxy is carried out with serious attention to the arguments of his predecessors. Abravanel takes great pains to understand their reasoning. He even supplies them with additional arguments, before he presents what he takes to be a decisive objection. In particular he expounds Maimonides' thought in considerable detail, defending him from his critics, while also insisting that Maimonides misrepresented the religious notions he analyses.

Abravanel's most original work lies in his view of history as either natural or artificial. Most human history is artificial, since it represents life in rebellion against God. The best form of government is not a monarchy, despite the views of most Jewish philosophers. For a monarchy does not essentially replicate the relationship of God with his subjects, and other forms of government can produce relatively successful societies. The Messiah, who will eventually transform artificial into natural history, is not a king but more a judge and prophet. He will establish the perfect society through a divine miracle. As long as the state is an absolute monarchy, however, its citizens owe absolute obedience to its ruler.

1 Life and works

Isaac Abravanel lived a politically active life during a particularly difficult time for the Jews in the Iberian Peninsula. Born in Lisbon, he received an education which was not concerned exclusively with Jewish subjects and from an early age he was writing philosophy and theology. He worked as the treasurer of the ruler of Portugal, and then in Spain, until the expulsion of the Jews in 1492 drove him to Naples. He then moved to Venice, where he did important political work for the authorities. His time in Italy seems to have been his most productive as a writer, and by his death he had composed a large number of works. Many of these are mainly theological, commentaries on the books of the Bible and other Jewish writings, but he also wrote more strictly philosophical works dealing with the thought of Maimonides (§3) and the particular theological and philosophical topics that Maimonides had made so controversial in Jewish philosophy. These include prophecy, providence, the creation of the world and the principles of Judaism. Abravanel is remarkable for his careful descriptions of the arguments of Maimonides and his opponents; indeed he lavishes so much time on exposition it is often difficult to discriminate his own opinion among those of the thinkers he discusses. He tends to argue that both Maimonides and his leading critics are mistaken in their arguments. Powerful though those arguments may appear, they need to be replaced by better arguments which accord more surely with the principles of Judaism.

2 The principles of religion

The cornerstone of Abravanel's critique of Maimonides lies in his response to Maimonides' theory of prophecy (see Prophecy §4). Maimonides provides what seemed to Abravanel to be an excessively naturalistic account of prophecy in his *Guide to the Perplexed*, and Abravanel was determined to establish that this could not be the Jewish position. Abravanel argued that prophecy is not a natural phenomenon but a miracle established by God. An individual requires no special characteristics, such as the wisdom that Maimonides had supposed was a minimal prerequisite of any authentic prophecy. On the contrary, Abravanel argues, God can make anyone prophesy whom he wishes. It is not true, Abravanel reminds his readers, that only Moses received prophecy at Sinai. On the contrary, Scripture makes it clear that all Israel participated directly in the communication from God. Nor is it the case, as Maimonides supposed, that only Moses could achieve prophecy through his intellect alone. Other prophets too surpass reliance on imagination when prophesying. Nor is prophecy a matter of dreaming; it is a miracle and unique. Abravanel was concerned that the stature of Maimonides as a rabbinic jurist would mislead Jews into thinking that the doctrine of the *Guide to the Perplexed* is an accurate guide to the correct understanding of the Jewish religion. In that book, Maimonides argues that (apart from the vexed question of creation and a few related issues) there is no essential incompatibility between Aristotelian philosophy (of the Neoplatonic variety then widely accepted) and the principles of religion. True, Maimonides had argued that ordinary believers should not have their faith challenged by having to work out how the philosophical and scriptural systems of thought are to be connected. Abravanel seeks to show that the biblical and philosophical theories are incompatible, and that the

latter cannot be seen as a valid distillation of the former.

He argues further that the view that prophecy is a miracle is the only view that is compatible with the religious texts of Judaism. The prophet's natural abilities are insufficient to produce prophecy of themselves, and the only necessary condition of being a prophet that human beings can achieve is moral excellence. Since all prophecy is miraculous, there is no essential distinction in this regard between Mosaic and non-Mosaic prophecy. Moses' prophecy is certainly superior to that of the other prophets in degree, but there is no qualitative difference between it and the revelations received by other prophets. The difference is that the prophecy of Moses came from God directly without going through the 'active intellect', the imagination or material apprehensions. Moses, moreover, prophesied while fully conscious. The message he received was entirely conceptual; it was grasped wholly by the intellect. A less perfect form of prophecy, intellectual prophecy, comes from God via the active intellect. It reaches the intellect of the prophet and not his imagination. At a still lesser level, imaginative prophecy consists of images, parables and mysteries. These may seem to resemble dreams, but in fact they are quite different. Imaginative prophecy receives the objective truth from God, albeit in a rather garbled form; dreams are merely subjective ideas produced by the imagination when not under any rational control. The least perfect form of prophecy is that experienced by the Israelites at Sinai through sight and sound, without going through either the intellect or the imagination. The prophet is the passive recipient of what flows from God, and the words and images of the prophecy itself are a direct result of God's will. The real distinction between Mosaic and non-Mosaic prophecy is simply that in that the former is received directly from God. The active intellect, moreover, is not to be understood in the Maimonidean way as a more or less free-standing source of natural events, but rather as a completely determined instrument of the divine will.

Although Abravanel seeks to counter Maimonides' theory of prophecy and to replace it with a theory which in his view more accurately coheres with the religious texts of Judaism, it is noticeable that he stays very close to the Maimonidean methodology in *Perush le-Moreh Nevukhim*, his commentary on the *Guide to the Perplexed*. In *Rosh Amanah (Principles of Faith)*, Abravanel takes up the defence of Maimonides' 'Thirteen Principles', which had led to much controversy in medieval Jewish philosophy. Maimonides had identified thirteen principles of belief that form the basis of the immortality promised to all Israel in the Talmud. The singling out of these thirteen beliefs seemed to claim for them a special status as the core expression of the theological essence of Judaism. But that would seem to imply that there are many other aspects of the religion that are not basic dogmas and so may be questioned without offending orthodoxy. Maimonides' approach to formulating a Jewish creed was criticized on this basis, and Abravanel stoutly defends the importance of Maimonides' principles against his critics, especially Crescas (§3) and Albo (§2), while finally arguing that these principles should not be regarded as the axioms of Judaism but just as very important beliefs, among many other doctrines and practices. The point of the principles, he suggests, is to impress upon ordinary believers what they should believe, since they are unlikely to have studied enough of the Torah to have understood the whole breadth of the 613 commandments. Maimonides is seen as presenting his principles as a religious aid for the intellectually unsophisticated. The more sophisticated understand that there are no basic dogmas in Judaism, and that all the commandments constitute the essence of the religion.

3 Political philosophy

The state arises as a necessity only through the expulsion of Adam from Eden. It will survive until the coming of the Messiah. Political life reflects our spiritual exile. It can never be perfect, although some states are more successful than others at fulfilling the spiritual as well as the political needs of citizens. In his commentaries on the Bible, Abravanel provides an account of what he takes to be the best form of society. This proves largely to be a recapitulation of Mosaic society. He sees this ideal state as consisting of lower courts, a high court and a ruler, perhaps a king. The officials of the lower courts are chosen by the people and handle their local affairs for themselves, while the high court or Sanhedrin is appointed by the ruler and establishes the juridical structure of the state as a whole. The members of this court are to be selected from the priests and levites. What is interesting in this notion of a mixed constitution is that it radically reduces the religious role of the king. There had been something of a tradition in Jewish philosophy of emphasizing the role of the king, given biblical passages which seem to suggest that choosing a king was a duty imposed by God.

Abravanel deals with these passages by arguing that what they mean is that choosing a king in Israel was not a duty, but simply a practice that was allowed. If a king is to be chosen, the biblical account tells the Jews what

characteristics he is to have. But there is no necessity to select a king for the state to be properly organized. Abravanel gives the examples of republican Rome and Venice to suggest that the desirable features of a monarchy can be easily replicated in a very different form of society. Israel does not require a king, because the judges can do whatever a king could do. Indeed, even judges are not essential, since God and the divine law, the Torah, can organize society correctly. Judges, of course, are required to carry out sanctions for disobedience to divine law. But in a society that is truly regulated by God, there would be no need for sanctions. Gentiles, since they do not have the Torah, do require political organization, and a king might be the right person to carry out this task for them. But from the experience of the Scriptures, there is no reason to think that a monarchy represents the best form of government for Israel. For the nation can rely on divine support and leadership for its welfare.

In states where a king disregards the laws and becomes a tyrant, his subjects have no right of rebellion. As subjects they must obey the monarch unconditionally; otherwise they are not subjects. The king in the state replicates God in the world. He has the right to take action not simply as regulated by the law but as is required by the particular facts of the case. As far as Israel is concerned, the choice of the king is a matter for God, and no one else has the right to remove or challenge him. Gentiles may rebel against monarchs who are not behaving as they ought, but Jews should not. Even a Gentile king should not be overthrown, since even he is in the place of God as far as his Jewish subjects are concerned, carrying out whatever punishment God thinks appropriate for his people. There is no point in Jews actively trying to set up a government which accords with Messianic rule. They must wait for God to bring this about when he decides the time is right. In a sense, then, Gentile rulers rule by divine right and with some degree of arbitrary authority, but Jewish rulers do not; they rule within the context of Jewish law. There are strong religious arguments, Abravanel argues, forbidding rebellion against either type of monarch. Within the context of the perfect society, however, in Messianic times, there is no need for a king. It would be better to be ruled by a group of judges guided by the will of God. It is not unlikely that this somewhat muffled but still perceptible anti-monarchistic line has its origins in Abravanel’s knowledge of Christian political thinkers, whose reflections he applies to Jewish political problems (see Political philosophy, history of).

4 Philosophy of history

History is the result of God’s decisions, and he is entirely free to do whatsoever he wishes, having created the world *ex nihilo* (see History, philosophy of). Both form and matter are divine creations, so there are no limitations on God’s power. God has not set up a natural mechanism which then operates independently of him, as the thinking of Maimonides might seem to suggest. Rather, the events that befall humanity are due either to the direct influence of God, the actions of another supernatural being, or the choices made by the exercise of human freedom. History starts with the creation of the universe. It consists of a divinely organized pattern of events. The end of history is salvation, which will be established by the Messiah and which will see Judaism triumph over its enemies. Adam was a perfect being who could have stayed in the Garden of Eden and developed his spiritual potentialities, but he freely chose to act otherwise. He disobeyed God through eating from the forbidden tree of knowledge, and in consequence he became subject to death and life in a hostile environment. Yet the possibility of salvation remained, and the Jews were established to represent the continuity of salvation. Their role is identical to the role of history itself, to attain final salvation for the whole of humanity. To make this possible God has helped the Jews, providing them with prophecy, which finally led up to the revelation at Sinai. He also took them to the land of Israel, which was entirely appropriate for their spiritual perfection and prophecy. Like Adam, though, they sinned and were punished. The Temple was destroyed, and they were sent into exile, a state which will continue until the coming of the Messiah, when history will come to an end, the Jews will be redeemed and perfect peace will prevail. At that time, humanity will be transformed into a final state of perfection and fulfilment. The sovereignty of the Messiah will be universal, the distortion of humanity since the exile from Eden will be ended, and human beings will once again be in a position to realize their own potentialities. The physical universe will be replaced by a spiritual realm in which human souls become immortal as they contemplate eternally the nature of the deity.

Abravanel’s general philosophical approach is entirely coherent, in that he sets out to link what he takes to be orthodox rabbinic Judaism with rational understanding. Where Maimonides goes awry, he argues, is in seeking religious correlates for his philosophical views. The sort of philosophy that attracted Maimonides is completely incompatible with Judaism, something which the extraordinary status of Maimonides in Jewish law tends to disguise. Abravanel has his finger on a vital issue here, in that it is the constant argument of Maimonides that if

one looks at scriptural and legal texts in the right sort of way one comes to realize that they are just another way of expressing philosophical truths. Abravanel seeks to establish an understanding of Judaism close to its literal formulation, and he argues that the apparent contradictions which Maimonides highlights between religion and philosophy are in fact real contradictions which show that Aristotelian philosophy cannot do justice to the Jewish religion. The thought of Maimonides is worthy of detailed study, since as a system in itself it represents an impressive attempt at a rational grasp of Judaism. All the same the effort eventually comes to nothing.

While Maimonides is a far more radical thinker than Abravanel when dealing with metaphysics, the position is reversed when it comes to political philosophy. Abravanel is prepared to interpret scriptural passages far more freely than is Maimonides. And he arrives does so quite uninhibitedly in his critique of monarchy as a system of government. His motives here arise from his attempt at establishing the genuine position of rabbinic Judaism as he sees it, but they are also mixed with his experience as a politician serving under a wide variety of rulers. The remarkable nature of his thought has led to its widespread study in both Jewish and Christian contexts.

Abravanel, Judah ben Isaac (*c*.1460/5-*c*.1520/5)

Judah ben Isaac Abravanel was born in Lisbon. After the expulsion of the Jews from Spain in 1492, Leone, as he was known, and his family migrated to Naples, but fled two years later following the French invasion. After brief residences in various Italian cities, Leone returned to Naples where he served as court physician to the Spanish Viceroy. Well-versed in the sciences of his day, including physics, medicine and philosophy, whether Jewish, Islamic or Christian, he composed his major work, Dialoghi d'amore (Dialogues of Love), in 1501-2. Although the work influenced such important thinkers as Montaigne, Bruno and Spinoza, its main influence was in literature rather than philosophy. Its style resembles that of other Renaissance works in the ambit of Ficino's commentary on Plato's Symposium but, unlike these works, it is neither philosophical commentary nor courtly literature. Adopting the idiom of courtly love and drawing on Platonic and Neoplatonic sources, it complements them with mythological, biblical and Aristotelian sources to produce a novel synthesis of Plato and Aristotle with ideas drawn from the pagan and the revealed traditions, aiming to demonstrate that love is the animating principle of the universe and the cause of all existence, divine as well as material.

The three dialogues between Philo, the poetic lover, and his beloved Sophia address the relations between love and desire, the universality of love and the origin of love. Each discussion pivots on an apparent opposition between Philo's Aristotelian and Sophia's Platonic views. The discussion of the relations between love and desire raises fundamental questions about the relations of soul and body.

1 Life

Son of the well-known Jewish thinker and statesman Isaac Abravanel, Judah ben Isaac Abravanel, known as Leone Ebreo, was born in Lisbon (the Italian Leone rendering the Hebrew Judah, in accordance with custom). Despite the family's fame, our knowledge of Leone's life is scant and rife with rumour and surmise. The following is restricted to what is relatively certain.

After serving for years as treasurer to the Portuguese King Alfonso V, Don Isaac Abravanel and his family fled Lisbon for Spain in 1483 when, after Alfonso's death, Don Isaac was accused of conspiring against the new king. He was soon summoned to the service of Ferdinand and Isabella and raised funds needed in their consolidation of power. The monarchs none the less decreed the tragic expulsion of the Jews from Spain in 1492. The Abravanel family migrated to Naples but were forced to flee again by the wars following the French invasion of 1494. After brief residences in various Italian cities, including Genoa, Barletta and Venice, Leone returned to Naples and became court physician to the Spanish Viceroy, Don Gonsalvo de Cordoba. The last reliable evidence about him is a document dated 1520 exempting 'Master Leon Abarbanel, the physician' and his family from all tribute in recognition of his services to the Viceroy. He died in Naples at some time between 1520 and 1525.

Leone was well-versed in the sciences of his day, including physics, astronomy, medicine and philosophy from the Presocratics to the Renaissance, spanning the Jewish, Christian and Islamic philosophical traditions. During his sojourns in various Italian cities, he visited the Italian academies, met celebrated Renaissance thinkers and wrote a treatise *De Coeli Harmonia (On the Harmony of the Heavens)*, at the request of Pico della Mirandola (probably the elder Pico, Giovanni, rather than his nephew Gianfracesco, who studied Hebrew under another well-known Jewish thinker, Yohanan Alemmano) (see Pico della Mirandola, G.). Leone also composed poetry, including an autobiographical Hebrew poem, *T'lumah 'al ha-Z'man (A Plaint on Time)*.

2 History and structure of *Dialoghi d'amore*

Uncertainties and controversies surround Leone's famous work, but by the author's own testimony, it was written in 5262 of the Hebrew calendar, that is, 1501/2. It was published in 1535 at Rome, when Leone's friend Mariano Lenzi 'rescued the work from the shades in which it was buried'. It first appeared in Italian, but the language of its original composition is disputed. Spanish, *Ladino* and Hebrew have their advocates, all more or less nationalistic in their motives and all prepared to argue that so erudite an author as Leone Ebreo should exhibit a more elegant style, even in an acquired language, than the published text presents. The only tangible evidence for a Hispanic original is a single late *Ladino* manuscript extant in the British Museum. Arguments for a Hebrew original are based on the presumed Jewish audience of the work, the long delay in its publication, and the survival of different

Italian versions.

The desire to claim Leone extends to his religious affiliation. The title page of the second and third editions of *Dialoghi d'amore*, describes Leone as Hebrew by nation but Christian by faith, prompting claims that he converted late in life. But there is no evidence of such a conversion, and the inscription, published in a period of religious intolerance (1541 and 1545), may well be bogus or wishful.

Ironically, in view of the efforts to claim them, *Dialoghi d'amore* is often dismissed as derivative of the Renaissance Platonist tradition that began with Marsilio Ficino's commentary on Plato's *Symposium* (see Ficino, M.). Yet the influence of *Dialoghi d'amore* extended far wider than Ficino's work. In the twenty years following its appearance the work had five Italian editions, three Spanish translations, two French translations, and translations into Latin and Hebrew. It influenced thinkers from Montaigne and Burton to Bruno and Spinoza, whose library contained a Spanish edition. Its poetic, dialogical style and what may superficially appear as an indiscriminate blending of sources focused its abiding acknowledged influence more in literature than in philosophy.

Dialoghi d'amore comprises three discussions of love as the animating principle of the universe. Philo is the poetic lover; Sophia, his beloved. The first dialogue discusses the relations between love and desire; the second the universality of love; the third the origin of love. The theoretical discussions in each dialogue are framed by a brief preliminary dialogue represented as an actual exchange between lovers, in which Philo voices his desire for Sophia and she critically refuses his seductive attempts to unite with her. The dialogical structure of the text arises from a fundamental difference between two philosophical views about love, broadly stated: (1) that love and desire are essentially the same, since we desire what we love, since love and desire are always for the good, and since genuine desire is based upon knowledge; (2) that love and desire are opposites, since love originates in knowledge of what is and is good, desire in knowledge of what is lacking in being and in goodness. The first opinion is Philo's and can loosely be called Aristotelian; the second is Sophia's and can be identified as Platonic.

The entire exchange, of course, is an allegory of philosophy. Philo's desire for Sophia is the philosopher's quest for wisdom, which is human perfection. The three successive dialogical attempts to resolve an apparently fundamental disagreement between Plato and Aristotle are also attempts to delineate the relations between the human and the divine. The dialogues progress from the more to the less evident, gaining in abstraction and complexity. Each later discussion develops the conclusions of what has gone before. The second discussion is twice as long as the first; the third, over twice as long as the second. No resolution of the question is presented, prompting the received opinion that Leone meant to compose a concluding fourth dialogue. This inference is unwarranted. The twenty years between the completion of *Dialoghi d'amore* and Leone's death suggests that he had ample time to complete the work had he considered it either possible or necessary. Rather, the lack of an explicit resolution mirrors the structure of the Platonic dialogues, especially the *Symposium*, the model for all Renaissance writings on love.

3 Philosophical significance of *Dialoghi d'amore*

The Platonic form that situates *Dialoghi d'amore* among other Renaissance discussions of love unfortunately obscures as much about its philosophical lineage and import as it discloses. Western scholars typically read Renaissance Platonic texts in Christian perspective, ignoring or misconstruing the influence of Islamic and Jewish philosophy, traditions that are seen as predominantly Aristotelian and thus fundamentally at odds with Renaissance Platonism, especially as regards the central issues of the *Dialoghi d'amore*. As a result, the influence here of such thinkers as Maimonides, Avicenna and Averroes tends to be judged rather superficially and on the basis of the few explicit references to them. For example, the possible influence of Avicenna's *Risalah fi'l-'ishq (Treatise on Love)*, or of Maimonides' focus on the intellectual love of God are rarely mentioned, and the Jewish aspect of Leone's work is reduced to its biblical allusions, for example Leone's claim that the Platonic ideas have a Mosaic origin (see Maimonides, M.; Ibn Sina).

Presuming that the literary genre of *Dialoghi d'amore* reflects sheer Christian Platonism, moreover, occludes the subtlety of Leone's resolution of the tension between the Platonic and Aristotelian approaches and covers over the contributions which the Aristotelian view of the soul can make to an understanding of desire, love and knowledge. Indeed, Leone's literary style may reflect a deliberate intention to occlude the radical thesis of the dialogue, a

deistic conclusion that identifies God with the totality of the world.

Rather than contribute further to the obscuring of Leone’s subtle and original contribution to Renaissance philosophy by offering an overview of *Dialoghi d’amore*, with its numerous, circuitous, subordinate discussions, lengthy and popularizing disquisitions on ancient mythology, astronomy and astrology, we shall focus on Leone’s nuanced resolution of the primary disagreement about the relations between desire and love, that is, the apparent contradiction between the claims that desire and love are the same, and that they are opposites. But we must note at the start that, while the first claim does not require a strict identity, the second assumes that any opposition implies a contradiction.

From the outset, Sophia’s resistance to Philo depends on interpreting the Platonic position as requiring a strict division between body and soul. It also requires real divisions within the soul, making its most noble part, the intellect, a distinct entity, absolutely independent of embodiment. Thus Sophia, the personification of wisdom, repeatedly and severely insists that if Philo truly loves her he should desire to satisfy that alone which pleases her, her mind.

There is a poignant irony here in the inverted relation between the male and female personae. Philo the male, or formal principle of the dialogue denies the real distinction between body and soul and, hence, between desire and love, whereas Sophia, the female, traditionally material, principle insists on such distinctions. But the resolution of the apparent contradiction between the Platonic and Aristotelian positions will establish body and soul, desire and love, male and female as natural correlatives: neither could be without the other. The same natural correlation is found between God and the world, as is mentioned briefly in passing, in the philosophical parts of the dialogues, thus protecting its radical theses from ‘vulgar’ view.

In the third, as in the preceding dialogues, Philo’s philosophical analyses (as distinct from the long poetic digressions) are distinctly Aristotelian in form, and often in content. Sophia’s objections continuously challenge the Aristotelian position with a Platonic one. In view of Philo’s pedagogic role in *Dialoghi d’amore*, the text can be read as the re-education of Sophia, whose Platonism reflects the dogma of Christian Neoplatonism. Thus, before he reverts to the definition of love, Leone makes amply evident his Aristotelian view of the soul:

> The soul is in itself one and indivisible, but by distributing its powers throughout the body and permeating even its surface and extremities, it branches out to certain activities pertaining to perception, movement and nutrition among various organs and divides itself among many diverse faculties.

This view of the relationship between body and soul will be reflected in Leone’s view of the relationship between the One and the many, that is, God and the world. Again, in the discussion of beauty as the form of the object which originates the motion of desire, Leone ‘corrects’ the Platonic doctrine of knowledge as recollection with an Aristotelian view of knowledge as arising from sensation. Forms do not exist independently of their corporeal manifestations but are embodied. They are abstracted by the intellect, which is initially mere receptivity to form. The ‘correction’ here is in fact a reconciliation of Plato with Aristotle, transposing the Platonic myth of anamnesis into a philosophical mode while simultaneously retrieving it from Christian interpretations:

> You must know, therefore, that all forms and Ideas do not spring from bodies into our souls, because to migrate from one subject to another is impossible; but their representation by the senses makes these same forms and essences to shine forth which before were latent in our soul. This enlightenment Aristotle calls the act of understanding and Plato memory, but their meaning is the same, although differently expressed.

Plato’s and Aristotle’s views are not only compatible, they are interdependent. Their harmony makes evident the insufficiency of either position taken in isolation. Plato’s teachings may be divinely inspired, but his mode of presentation lacks philosophical precision and so might lead to error. The resolution of the tension between Plato and Aristotle, fully and finally articulated in the third dialogue, makes clear that the opposition is only apparent and reflects terminological differences and a failure to recall that natural opposites belong to a single motion from potentiality to act.

Returning to the discussion of love in the third dialogue, Philo proceeds in an exemplary Aristotelian manner, pointing out that the questions ‘What is love?’ and ‘What is its first cause or origin?’ presuppose that love exists. He repeats the definition of love as desire and answers Sophia’s insistent objections that love and desire are not the

same, since we love what is and what we actually possess, but desire what we lack and what may or may not exist, by pointing out that reason demonstrates that love and desire are the same, although ‘in the vulgar tongue each has its own significance’. Sophia has taken a mere linguistic, conventional distinction for a real one, a confusion that Philo finds to be common among ‘certain modern theologians’.

Love and desire are different words denoting a single affection of the soul. Desire is a motion towards a desired object, love, a motion towards the beloved, which is the desired object. The cause of this motion, that is, the origin of love, is the desire for the pleasure of union with the beloved. Furthermore, *pace* Plato, love and desire are found in God. Indeed, God is their origin; in God they are found most eminently, as the desire for the perfection of all that is.

By following Aristotle closely, Philo demonstrates the proximity of truth and desire characteristic of true friendship, especially a friendship oriented by and toward God. Echoing the *Nicomachaean Ethics*, Philo explains to Sophia that he disagrees with Plato ‘because, as Aristotle, his disciple, said of him, although I am the friend of Plato, I am a greater friend of truth’. It is in virtue of their common love of truth that philosophers are friends and are also friends of God, a friendship, Philo insists, that cannot be one-sided.

To appreciate the radical force of the definition of love that emerges from the resolution of the tension between the Platonic and Aristotelian positions, we must turn to the cosmology underlying *Dialoghi d’amore*. According to Philo, the universe is a single individual composed of perfectly proportioned parts, all of which, whether eternal or perishable, are constitutive of its perfection. The perfection proper to each part, its final end or good, is the perfection of the whole, not just its own perfection. More precisely, since the final end or good is the perfection that all things by nature desire, all strive in proportion to their capacity to attain the perfection of the universe. Thus the natural perfection desired by each part is simultaneously a desire for perfect harmony or union with the whole. That is why love is the animating principle of the entire universe, of being as well as becoming. As the animating principle of the universe, love is its efficient cause; as the desire for the perfection of the whole, it is its final cause. The universe as a whole is a perfect circle, its final cause identical with its other causes, first, formal and efficient. Conceived as unified, this cause is identical with God.

The identity of God and the whole of nature cautiously alluded to in the philosophical parts of *Dialoghi d’amore* was later developed explicitly and in detail by Spinoza. Nowhere is the kinship between the two Portuguese Jewish thinkers more evident than in Leone’s description of the union between the human and divine intellects:

> The pure intellect which shines forth in us is likewise the copy of the pure divine intellect, and is stamped with the unity of all the Ideas; and this it is which, crowning the discourse of reason, reveals to us those ideal essences in intuitive, single, and abstract knowledge, when our well schooled reason merits such knowledge. So that with its eyes, we may behold in one intuition the highest beauty of the first intellect and of the divine ideas.

Absolute, the

The expression 'the Absolute' stands for that (supposed) unconditioned reality which is either the spiritual ground of all being or the whole of things considered as a spiritual unity. This use derives especially from F.W.J. Schelling and G.W.F. Hegel, prefigured by J.G. Fichte's talk of an absolute self which lives its life through all finite persons. In English-language philosophy it is associated with the monistic idealism of such thinkers as F.H. Bradley and Josiah Royce, the first distinguishing the Absolute from God, the second identifying them.

1 Theories of the Absolute

With Fichte, Kant's transcendental ego (the relation of which to individual persons was somewhat vague) became a single absolute cosmic self which lives its life through each of us and posits the natural world as that through struggle with which it can develop itself morally (see Fichte, J.G. §3). With Schelling, the absolute self became the Absolute as the mysterious ground of all being, revealing itself in parallel both in *nature* (the creation of our shared unconscious) and in *finite thought*, of which it is somehow the identity-in-difference (see Schelling, F.W.J. §1). Later, Schelling held that the ordinary world of finite things springs from their somehow falling away from their proper eternal place within the Absolute in an arrogant attempt at independent existence. With Hegel, the Absolute became the Absolute Idea, somehow both the culmination and the self-differentiating unity of the cosmic dialectical sequence or circle (see Hegel, G.W.F. §6). This may be most conveniently conceived as starting with the concept of pure being, moving through a series of concepts towards their exhibition in empirical nature, and finally through a series of levels of human life, until it becomes self conscious as Absolute Spirit in the higher forms of this, especially in the civilized nation state and in the philosophic mind. Whether Hegel also ascribes to it a more cosmic self-consciousness is controversial - certainly it is somehow a self-differentiating spiritual unity.

More conspicuous in the English-speaking philosophical world were the conceptions of the Absolute of F.H. Bradley, Josiah Royce, J.M.E. McTaggart and other absolute idealists in a tradition not yet dead (and still representing, arguably, our best grasp of how things really are). For Bradley and Royce, the Absolute was a single spiritual individual of which all finite things are, if not exactly parts, at least part-like aspects. For McTaggart, in contrast, it was the Universe conceived as a system of selves linked directly or indirectly by bonds of affection and appearing to each other much of the (apparent) time as the physical world.

British and US absolutists tended to treat time more bluntly as an illusion than did their German predecessors mentioned above. For the former, the Absolute was a *Nunc Stans* containing all finite experiences which, although they appear to themselves to be in time, are in truth its eternal components. For the German absolutists (at least for Fichte and Schelling) free will, fairly much as it is commonly conceived, was among the most stressed features of the Absolute, and derivatively of humans. Indeed, their chief quarrel with Spinoza, whose monism they were trying to capture in more Kantian terms, was his determinism. The British and US absolutists were more Spinozistic on this matter, believing frankly in a 'block universe'.

2 Bradley and Royce

Arguably the best case for, and the best characterization of, the Absolute was that of Bradley and Royce. For Bradley, the Absolute was 'a single Experience, superior to relations and containing in the fullest sense everything which is' (Bradley 1914: 246). For Royce it was a universal self whose life is composed of the lives of all conscious beings (there being no others) experienced in unity.

Their argument was somewhat as follows. First comes the well-argued idealist claim that there is no such thing as unexperienced reality - in fact there is nothing other than lived experience itself. Now, on the face of it, experiences occur as aspects or components of finite centres of experience, such as we think of as the consciousness of men and animals, so it seems that the world must be the totality of these. But how are they in any real relation to one another rather than isolated monads, each altogether wrapped up in itself? The common-sense view is that they are variously juxtaposed in a single space and time, just as are the brains which underpin them. But for idealism, space and time and all their contents exist only as presentations within, or constructions wrought within, centres of experience so that it is these that contain them rather than vice versa. There must, then, be some kind of whole other than that of space and time within which finite centres of experience exist, and this can only be

some more comprehensive, indeed 'infinite', centre of experience within which they all occur together in a mutually necessitating manner. This will be timeless, yet will contain each centre of experience in every one of its temporal phases, and it will be a state of perfect understanding of, and satisfaction with, itself and all that it contains (for ignorance and dissatisfaction can have no place when nothing from outside can block knowledge or desire).

Royce added his own special twist to the argument by contending that there could not be a relation of *aboutness* between one's thoughts and external objects (and that therefore one's thoughts could only be about the present contents of one's own mind) unless the thoughts and the external objects were all contents of one all-embracing mind which used the former as a correct or incorrect way of characterizing the latter.

One problem with the Absolute, as conceived by Bradley and Royce, was a special version of the problem of evil: How can the whole be perfect when so many of its parts or aspects are so bad? This objection was presented in its most lively form by William James. Royce gave the most elaborate solution. The highest goods consist in the overcoming of evils, so that what is mere evil from a finite point of view is, from the Absolute's point of view, that which is eternally overcome by the good which keeps it down. The true image of the Absolute is Saint George, with the dragon struggling perpetually beneath him, the whole thereby possessing a perfection much greater than the merely saccharine goodness of a world without evil (see Evil, problem of §1).

Many of these absolutists, though decidedly not all, saw the Absolute as the Christian God properly conceived; however, in some respects the Absolute of Western absolute idealism is much closer to Brahman as conceived by Advaita Vedānta, though a more active Brahman than the West wrongly supposes to be the Hindu one (see Vedānta).

Absolutism

The term 'absolutism' describes a form of government in which the authority of the ruler is subject to no theoretical or legal constraints. In the language of Roman law - which played a central role in all theories of absolutism - the ruler was legibus solutus, *or 'unfettered legislator'. Absolutism is generally, although not exclusively, used to describe the European monarchies, and in particular those of France, Spain, Russia and Prussia, between the middle of the sixteenth century and the end of the eighteenth. But some form of absolutism existed in nearly every European state until the late eighteenth century. There have also been recognizable forms of absolute rule in both China and Japan.*

As a theory absolutism emerged in Europe, and in particular in France, in the late sixteenth and early seventeenth centuries, in response to the long Civil Wars between the Crown and the nobility known as the Wars of Religion. In the late eighteenth century, as the reform movement associated with the Enlightenment began to influence most European rulers, a form of so-called 'enlightened absolutism' (or sometimes 'enlightened despotism') emerged. In this the absolute authority of the ruler was directed not towards enhancing the power of the state, but was employed instead for advancing the welfare of his subjects.

1 The legal definition

Like most such terms, absolutism is a nineteenth-century coinage. But the term 'royal power absolute' was employed, in one context or another, by nearly all the monarchs of Europe from the late fifteenth to the mid-eighteenth century.

Although it was sustained by, and has become associated with, a number of social and cultural developments - lavish courts, an extensive bureaucracy, standing armies and the creation of a new noble class - absolutism was primarily a theory of legislative authority. This maintained that all rulers possessed exclusive executive and legislative authority, and consequently that the laws they made constituted an expression of their will. In the formula used by the jurist Ulpian, and repeated in one form or another by all would-be absolute monarchs, 'that which pleases the prince has the force of law'. All theories of absolutism claimed, in effect, that modern kings possessed the same authority - frequently described by the term *imperium* - as that once exercised by the Roman emperors. To sustain this claim common law, based as it was upon the legislative will of the community, was gradually replaced throughout Europe during the sixteenth and seventeenth centuries by Roman law. (The sole major exception was England, the ambition of whose monarchs was checked by the execution of Charles I in 1649.) The only theoretical limit to the monarch's legislative authority was the Divine and Natural Laws, which, since there was no one other than God to execute them, provided only the flimsiest of constraints. The kings' positive laws might be interpreted within certain narrowly defined limits (although all absolute rulers from Justinian to Napoleon attempted by codification to eliminate interpretation), but they were mandatory (see Roman law).

Absolutism was thus a radical attempt by increasingly centralized, increasingly modern, states to overturn the broadly contractual theories of authority which had grown up after the collapse of the Roman Empire. These had maintained that the king derived his authority from a contract with the people, who had been granted power directly by God himself (see Contractarianism). The laws were made by the representative assemblies of the people and administered by the king. He was the *servant* of his people, and his role was one of magistrate not judge. And although in practice the people had few means by which they might rid themselves of a ruler, there did exist quite powerful safeguards for their collective rights. Absolutism, in contrast, denied the representative assemblies any legislative or executive power. In Spain, the Cortes had been reduced to little more than a tax-voting body by the mid-sixteenth century. In France, the Estates General fell into disuse after 1612, and in 1673 the Parlement of Paris, a body which modelled itself on the Roman Senate, was deprived of even its hallowed right to remonstrate against royal edicts before registering them.

2 Two theories of absolutism

Despite its essentially legal core, absolutism was by no means a single or unitary theory. In its most extreme form, it maintained that the power of the ruler derived directly from God, as the source of all created things. This, known

as Divine Right, found its most powerful exponent in Jacques-Bénigne Bossuet. Bossuet claimed (an argument he derived from Hobbes) that as the people had had no historical sovereign before the institution of kingship, kings must have been the creation of God, and were, therefore, accountable to him alone. Most theories, however, including Hobbes's own, were dependent upon some version of an original contract theory (see Hobbes, T. §7). These fell into two broad categories.

The first maintained that royal authority derived, as the contractualists had maintained, from an agreement between the ruler and his people, but that since this was a contract, it involved an irreversible transference of power. The people might be entitled under certain conditions to resist their rulers, but they no longer possessed the authority to replace him. Perhaps the most persuasive, and certainly the earliest exponent of these claims was Jean Bodin (§3) whose *Les six livres de la république (The Six Books of a Commonwealth)* first appeared in 1576. For Bodin the state was the 'lawful government of many families'. The ruler held the same position *vis-à-vis* society as the father did towards the members of his family. This granted him absolute and undisputed power over them. (Bodin even wished to see the right granted to fathers by Roman law to execute their children reintroduced into France.) Sovereignty, which was to become the key term in all subsequent discussions of royal authority, could thus be defined as 'the giving of laws to their subjects in general *without their consent*'. Legal authority and the state itself thus became an expression of the king's legislative will (see Sovereignty).

The second theory, whose most powerful exponent was the Spanish Jesuit theologian and jurist Francisco Suárez (§4), maintained that the authority of all rulers derived from a delegation of power from the people (Suárez 1612). Although, like Divine Right, this granted the ruler absolute legislative and executive authority, it meant that the people could, *in extremis* (or if the throne fell vacant), reclaim that authority. For this reason Suárez, like most Jesuits, accepted that tyrannicide might be an acceptable means of disposing of an unjust ruler, an opinion which led to the public burning of his writings in both London and Paris.

On both accounts, the people retained certain rights as individuals; crucially, that of self-defence and (for Bodin) the right of property. Having surrendered, in Hobbes' formulation, both their will and their judgment to their rulers, they were wholly subject to them, but they remained free agents. Furthermore, although his person and the state became a single entity, the ruler did not have property rights in the state and could not, therefore, alienate any part of it. There therefore existed a distinction, albeit one which subsequent legal theorists such as Montesquieu would reject as illusory, between 'absolutism' and 'despotism'. As even Bossuet was prepared to concede, a king's rule should be absolute, but never (as the Ottoman Sultan's was thought to be) arbitrary. In practical terms this meant that the king should, wherever possible, consult the representatives of his subjects, but he was not obliged to follow their advice. The king should also abide by his own laws, and respect local custom. But all absolutists allowed that such constraints could be set aside in cases of necessity. The concept of 'necessity' as a device whereby the rule of law might be suspended - closely associated as it was with theories of 'reason of state' - thus became a key term in the vocabulary of absolutism.

3 Absolutism and the modern state

For all its archaic trappings, absolutism was essentially a modern theory of state authority. Writers like Bodin, Hobbes, Suárez and Bossuet possessed a recognizably modern conception of legislative authority as the means to protect the interests of the entire society. All, in different idioms, argued that unless such authority was clearly vested in one source, no society could ultimately escape internal conflict of the kind which had afflicted France in the sixteenth and England in the seventeenth century.

Numerous historians have argued that, despite the vast body of theoretical literature endorsing absolute rule, the power of early-modern monarchs was never in fact complete. But no state power ever is. The theory of absolute sovereignty was about *de jure* not *de facto* power. By the end of the seventeenth century, moreover, the rulers of Spain, France, Sweden, Russia and large parts of Germany had gained effective control over all the armed forces and communications within their territories. Their subjects may have defied them, but they never consistently challenged their right to rule.

Absolutism sought to establish in this way the undisputed power of the state over the numerous factional and regional interests which had governed medieval societies. In the sixteenth and seventeenth centuries this power was embodied in kings. But, as Hobbes said, it did not really matter if the ruler was one or many. The final

beneficiaries of this insight were the French Revolutionaries. Far from being the end of absolutism, the Revolution was its fulfilment. For it was the Revolutionaries who, by replacing the monarch with an assembly, assured the final transformation of French society into a modern - and absolute - parliamentary state. By the end of the nineteenth century all the major states in Europe, with the exception of Britain and Russia, had followed their example.

Abstract objects

The central philosophical question about abstract objects is: Are there any? An affirmative answer - given by Platonists or Realists - draws support from the fact that while much of our talk and thought concerns concrete (roughly, spatiotemporally extended) objects, significant parts of it appear to be about objects which lie outside space and time, and are therefore incapable of figuring in causal relationships. The suggestion that there really are such further non-spatial, atemporal and acausal objects as numbers and sets often strikes Nominalist opponents as contrary to common sense. But precisely because our apparent talk and thought of abstracta encompasses much - including virtually the whole of mathematics - that seems indispensable to our best attempts to make scientific sense of the world, it cannot be simply dismissed as confused gibberish. For this reason Nominalists have commonly adopted a programme of reductive paraphrase, aimed at eliminating all apparent reference to and quantification over abstract objects. In spite of impressively ingenious efforts, the programme appears to run into insuperable obstacles.

The simplicity of our initial question is deceptive. Understanding and progress are unlikely without further clarification of the relations between ontological questions and questions about the logical analysis of language, and of the key distinction between abstract and concrete objects. There are both affinities and, more importantly, contrasts between traditional approaches to ontological questions and more recent discussions shaped by ground-breaking work in the philosophy of language initiated by Frege. The importance of Frege's work lies principally in two insights: first, that questions about what kinds of entity there are cannot sensibly be tackled independently of the logical analysis of language; and second, that the question whether or not certain expressions should be taken to have reference cannot properly be separated from the question whether complete sentences in which those expressions occur are true or false.

1 Logical and ontological categories

Although what most obviously needs explaining is the abstract-concrete distinction, the relevant notion of *object* also calls for elucidation. There is a familiar, everyday use of the term 'object' in which we may speak of the objects found in the accused's pockets, for example. There are probably no very precise rules governing this use, but it seems clear that being extended in space and time is at least a necessary - but probably not a sufficient - condition for its application. If 'object' is so understood, the term 'abstract object' is straightforwardly self-contradictory. We should infer, not that Nominalism wins by default, but that some other more general, less restrictive notion of object is in play in philosophical discussions. But if so, how should it be characterized? To avoid begging questions, it might be proposed that anything should be reckoned an object to which we may make reference. Arguably, however, this goes too far the other way - we may as well be said to refer to fiddling as to Nero, when we assert that Nero fiddled, but should be loathe to count fiddling an *object*.

A way forward which preserves this general approach is to take objects to be the referents of expressions of a certain restricted class - what are usually called 'singular terms'. To take this step is to follow Frege in viewing the ontological categorization of entities as dependent upon a prior logical categorization of expressions. Objects, properties and relations, for example, are essentially the non-linguistic correlates of, respectively, singular terms (for example 'Nero', 'this lake', 'the dome of St. Peter's' and so on), one-place predicates ('… fiddles', '… is deep'), and two- or more-place predicates ('… loves… ', '… is taller than… '). An object, on this account, is the referent of an actual or possible singular term.

When *object* is so understood, our opening question is, in an important sense, a distinctively *modern* one. It is not that we can discern no significant common concerns underlying ancient disagreements over the status of Plato's Forms and the great medieval battle between realists and nominalists over the existence of universals on the one hand, and modern ontological disputes on the other. Traditional and modern discussions share a general concern with the relations between language and the world. At bottom, disagreement over abstract entities is disagreement over whether an adequate account of language-world relations can be provided without reference to any such entities. It remains the case that a fundamental shift has taken place in the way very many philosophers conceive and argue about ontological issues in general, and issues about abstract entities especially. Ancient and medieval disputes focused on the existence of universals as opposed to particulars, with the former thought of as abstract

entities which both predicates ('is red', 'is wise') and corresponding abstract nouns ('redness', 'wisdom') stand for. But on the Fregean approach, it makes no sense to suppose some one kind of thing to be the common referent of expressions of completely different logical types. This need not mean that there is no significant disagreement between medieval realists and nominalists; but it does mean that they misconceived the issue, or at least ran together questions we should separate. For it is one question whether abstract nouns are to be conceived as genuine singular terms, standing for objects, and a quite distinct question whether the corresponding predicates have reference - if so, then they stand, not for objects, but for properties (concepts, in Frege's sense) (see Universals).

2 The abstract-concrete distinction

Abstract objects can be neither seen nor heard, nor can they be tasted, felt or smelled. But for several reasons it would be unsatisfactory to take inaccessibility to sense-perception as the basis of our distinction. Besides importing an unwanted relativity to human sensory faculties, it would fail to draw the distinction clearly, there being room for dispute over what should count as perceiving something. If the range of sense-perception is taken as including only what can be discerned with the naked organ, as it were, the condition for being concrete is clearly too restrictive. The range might be extended to allow for detection via more or less remote effects, but once the criterion is loosened in this way, the proposal slides into taking capacity for involvement in causal interactions as the mark of the concrete. This suggestion avoids the difficulties with a sensory-access criterion but, even if extensionally correct, does not go to the heart of the matter. We expect capacities in general to have some categorical basis. Why are concrete objects capable of causal interaction but abstract objects not? The answer, it would seem, should yield a more illuminating account of the distinction. Partly for this reason, a more promising account of the distinction sees lack of location in space or time as distinctive of the abstract - what cannot be anywhere, anywhen, cannot be a factor in the causal nexus.

Although it is widely endorsed and gives intuitively correct results in the cases to which philosophers have attended, this account is nevertheless flawed. This is because there are candidates for abstract status which, though plainly lacking spatial properties, are not wholly atemporal. In the sense in which two pairs of players at different chessboards may be said to be engaged in one and the same game, the game of chess is plausibly taken to be an abstract object; but while it is not located anywhere, it has not always existed, but was devised at a certain time. Other examples are natural languages, many if not all works of art, and words and letters in the type- as opposed to token-sense (roughly, the sense in which there are just six, not eight, distinct letters in the word 'abstract') (see Type/token distinction). Thus while the abstract-concrete distinction undoubtedly has much to do with spatiality and temporality, it does not seem straightforwardly identifiable with the distinction between what has spatial or temporal position and what has neither. An alternative proposal of considerable interest is that concrete objects are those which are, in principle, capable of being picked out ostensively, while abstract objects are those to which we can refer only by means of some functional expression (Dummett 1973: ch. 14). Thus we may pick out a particular tree by the words 'That beech', perhaps accompanying our utterance with a pointing gesture; but we cannot, for example, literally point to a certain shape or number - rather, we must refer to them as, say, the shape of such and such a vase or the number of eggs in the carton (Noonan 1976; Hale 1987: ch. 3).

3 Grounds for belief in abstract objects

Many philosophers, appealing to Ockham's Razor - the principle that entities should not be multiplied beyond necessity - deem it mortally sinful to believe in abstract objects unless such belief is unavoidable, but disagree about whether it is actually avoidable. Orthodox nominalists hope to avoid it by carrying through a programme of reductive paraphrase. However, in view of the resistance of various kinds of apparent reference to/quantification over abstract objects to elimination by reductive paraphrase or re-interpretation in concrete terms, this does not appear feasible as a completely general means of escaping commitment to abstract objects (see Ontological commitment). This has led some philosophers to conclude that reference to and quantification over domains including abstract objects is indispensable to a fully adequate account of the world. There is a strong appearance that this is the case with reference to mathematical entities - numbers of various kinds, functions and more generally, sets. On the face of it, the natural sciences, and physics especially, require substantial use of arithmetic and analysis, and the latter in turn draws fairly heavily on set theory. This argument - known as the Quine-Putnam Indispensability Argument - provides, if accepted, a strong *indirect* reason for believing in numbers and sets at least: scientific theories require acceptance of mathematical theories, so that whatever reasons we have to believe

that our best scientific theories are true is reason to accept mathematical theories, and so to believe in the abstract objects of which they speak.

This argument has been vigorously contested, particularly by Field (1980), who argues - in support of a new and highly unorthodox brand of nominalism - that there is, contrary to appearances, no need for mathematical theories to be true for their use in science to be justified. It is enough that such theories should have a certain strong kind of consistency property, which he calls ‘conservativeness’. Since a nominalist can accept mathematical theories as having this property without believing them to be true, they have no need to engage in any kind of reductive translation programme of the sort previously mentioned - they can simply use mathematical theories while denying that they are literally true, thereby avoiding commitment to the abstract objects their truth requires. Among the difficulties confronting this approach, one important assumption Field makes is worth highlighting. Field takes the Quine-Putnam argument to offer the only ground worth taking seriously for holding mathematical theories to be true, so that if he is able to undermine it, there remains no pressure to take on the ontological commitments they import. If Field’s assessment were correct, the best grounds we could have for believing maths and so on, would be indirect and a posteriori. But this assessment rests upon the challengeable assumption that the only statements we may justifiably accept on other-than-indirect a posteriori grounds are those directly ascertainable as true by observation. Perhaps we should take seriously, as he does not, the possibility that belief in the truth of mathematical statements and acceptance of their ontology may be warranted a priori.

4 Grounds for disbelief

Unquestionably the most important arguments against abstract objects are epistemological. One is that - in view of the presumed causal inertia of abstract objects - to construe statements of some given kind as having their truth-conditions constituted by states of affairs essentially involving such objects, puts those statements irretrievably beyond the reach of our knowledge. Crudely, if mathematical statements have Platonistic truth-conditions, we could not possibly know them to be true; since we do have mathematical knowledge, Platonism is false. In its simplest and earliest versions, this argument relies upon a very exacting form of causal theory of knowledge, which takes it to be an invariably necessary condition for a thinker *X* to know that *p*, that *X*’s true belief that *p* should itself be caused by, or otherwise suitably causally related to, the fact that *p* (see Knowledge, causal theory of). A problem with this argument is that while such a strong condition (just how strong depends on how precisely the vague phrase ‘suitable causal relation’ is understood) may be satisfied in standard cases of perceptual and memory knowledge, it is very hard to see how it could be quite generally met, even when restricted in scope to ordinary empirical knowledge concerning perfectly concrete matters. Our inductively grounded belief that all aardvarks have bugs is, we may suppose, causally induced by inspection of a large and suitably varied contingent of bug-infested aardvarks - but there is no sort of causal relation, however complicated or attenuated, of which it may with any plausibility be claimed both that it holds between our general belief and the fact that all past, present or future aardvarks have bugs and that its holding is epistemically significant. If knowledge does not demand a suitable causal link in every case, the argument against Platonism collapses, at least in its present form.

A related argument alleges that no satisfactory sense can be made of the idea that we are capable of identifying reference to or thought about abstract objects. And once again, the argument in its simplest form rests upon an eminently challengeable assumption - in this case, that identifying reference or thought about a particular object *always* requires a suitable causal link between the speaker/thinker (or their utterance/thought) and the object in question (see Reference). Opponents of Platonism may hope to fashion more sophisticated causal analyses of knowledge and reference which are strong enough to sustain versions of these objections without being so strong as to be independently objectionable, but none has yet come forth.

A more powerful epistemological objection appeals to the thought that, even if knowledge is not to be analysed in specifically causal terms, we should expect to be able to provide a naturalistic explanation of our tendency to get things right significantly more often than not, in any area where we are disposed to credit ourselves with a capacity for knowledge (see Reliabilism). In the absence of causal or other natural relations between ourselves and abstract objects, it is hard to see how any such credible explanation might run for any region of discourse whose statements are supposed to carry Platonistic truth-conditions. The argument relies on the assumption that ontological views are tenable only to the extent that they leave space for a credible epistemology. The arguments reviewed here

confront Platonism with a strong challenge, even if they could not, by their very nature, tell decisively against it.

Academy

The Academy was a public gymnasium in northwest Athens. Plato taught there, and the Academy remained the centre of Platonic philosophizing until the first century BC*. Hence the term 'Academy' came to be used to designate Plato's school; members of the school were called 'Academics'. (And hence, ultimately, the modern use of the words to describe intellectual institutions and their members.)*

The word 'Academy' originally had a topographical reference. A mile and a half northwest of the Athenian agora, along the Ceramicus road, there was a public gymnasium and wrestling square set in a spacious park. Like most gymnasia, the Academy contained an exedra - a sort of open-air lecture theatre. Here Plato talked and taught philosophy. He set up a shrine to the Muses in the park; and he acquired a house, with a little garden, in the neighbourhood, where his friends and pupils congregated. A contemporary comic poet imagines a group of students assembled in the garden earnestly attempting to produce a definition of the pumpkin.

Plato's house was used by his successors until the time of Polemo (in the late fourth century BC), whose pupils lived in huts in the garden; and Platonists continued to teach in the Academy until the beginning of the first century BC. But after that time there seems to have been no special relationship between Platonism and the geographical Academy.

The word 'Academy' was readily transferred from the concrete to the abstract: it came to designate the school or institution which Plato established and which his successors conserved. The nature of the institution is imperfectly known; but it is clear that there was a head, or 'scholarch', who was (at least sometimes) elected to office; that there were senior and junior members; and that there were discussions, lectures and dinners. Yet the Academy was not an embryonic university: there were no degrees and no administration block.

On Plato's death in 347 BC, his nephew Speusippus led the school. He was followed by Xenocrates Polemo and Crates. In about 265 BC Arcesilaus assumed the scholarchate and turned Platonism down the sceptical path which it followed for almost two centuries. Of later scholarchs the most engaging and the most celebrated was Carneades. In 88 BC, when Athens was in the grip of war, the scholarch Philo of Larissa decamped to Rome. It seems likely that Philo was the last Platonist geographically connected to the Academy. But philosophy is above mere geography, and Platonism survived and flourished until the end of the ancient world. Modern authors will refer to later Platonists as Academics: the nomenclature is inaccurate, the inaccuracy venial.

Ancient writers, remarking upon apparent changes in the intellectual drift of the school, would speak of a plurality of Academies. The most generous listed five: the Old Academy, which lasted from Plato to Polemo; the Middle Academy, founded by Arcesilaus; the New Academy, inaugurated by Carneades; a fourth Academy under Philo; and a fifth under Antiochus. The Academics did not necessarily endorse these divisions. Thus Cicero, himself professing an Academic scepticism, simply distinguished between the Old Academy from Plato to Polemo and the New Academy from Arcesilaus onwards; and Philo notoriously maintained that there had only ever been one Academy.

Action

Philosophical study of human action owes its importance to concerns of two sorts. There are concerns addressed in metaphysics and philosophy of mind about the status of reasoning beings who make their impact in the natural causal world, and concerns addressed in ethics and legal philosophy about human freedom and responsibility. 'Action theory' springs from concerns of both sorts; but in the first instance it attempts only to provide a detailed account that may help with answering the metaphysical questions.

Action theorists usually start by asking 'How are actions distinguished from other events?'. For there to be an action, a person has to do something. But the ordinary 'do something' does not capture just the actions, since we can say (for instance) that breathing is something that everyone does, although we don't think that breathing in the ordinary way is an action. It seems that purposiveness has to be introduced - that someone's intentionally *doing something is required.*

People often do the things they intentionally do by moving bits of their bodies. This has led to the idea that 'actions are bodily movements'. The force of the idea may be appreciated by thinking about what is involved in doing one thing by doing another. A man piloting a plane might have shut down the engines by depressing a lever, for example; and there is only one action here if the depressing of the lever was (identical with) the shutting down of the engines. It is when identities of this sort are accepted that an action may be seen as an event of a person's moving their body: the pilot's depressing of the lever was (also) his moving of his arm, because he depressed the lever by moving his arm.

But how do bodies' movings - such events now as his arm's moving - relate to actions? According to one traditional empiricist account, these are caused *by* volitions *when there are actions, and a volition and a body's moving are* alike *parts of the action. But there are many rival accounts of the causes and parts of actions and of movements. And volitional notions feature not only in a general account of the events surrounding actions, but also in accounts that aim to accommodate the* experience *that is characteristic of agency.*

1 Actions, events and individuation

'Action' and 'act' are often used interchangeably. But 'action' is given a definite meaning when actions are taken to be a species of events: it denotes particulars of a certain sort - concrete items in the spatiotemporal world. It is useful then to give a different meaning to 'act': acts are things people do (which are sometimes called act-types). Such things are not particulars, since one person can do the same thing as another. If Mary and John both voted for Smith, for instance, then Mary's act (voting for Smith) was the same as John's; but obviously the event that was Mary's voting for Smith was not the same action as John's voting for Smith.

Is Mary's voting for Smith ever the same action as *Mary's* doing some *other* act? This is a question now about the individuation of actions. Proponents of a fine-grained account (for example Goldman 1970) say that there are as many actions as there are acts exemplified by the agent on occasion, so that, in our pilot example, the man's depressing of the lever is one action and his shutting down of the engines is another action. Proponents of a coarse-grained account, on the other hand (for example Davidson 1971), assert the identity of his depressing of the lever with his closing down of the engine. They think that actions are often described in terms of their effects. When the description 'Paul's depressing of the lever' is used, an event is seen to have resulted in the lever's being depressed; when 'Paul's shutting down the engines' is used, an event is seen to have resulted in the engines' shutting down. But if Paul shut down the engines *by* depressing the lever, then the lever's coming to be down in its turn caused the engines' cutting out, so that in fact an action of Paul's is spoken of twice over here: it is described now in terms of one effect, now in terms of another.

This coarse-grained account can be made plausible by thinking of *Paul's* part in the engines' coming to be shut down as his moving of his arm. The thought is that for the engines to shut down, nothing was required of Paul after his arm had moved. Since he is the only relevant agent, Paul's moving his arm is the only action that there is, and 'his moving of his arm' is just one of its descriptions.

Various objections are made to the coarse-grained account, and these have led some philosophers (for example Ginet 1990) to intermediate accounts of actions' individuation. (An intermediate account might have it that Paul's

moving his arm is the same as his moving his arm against the lever (which would be denied by the fine-grained theorist), but is different from his shutting down of the engines (which would be denied by the coarse-grained theorist).) One objection to the coarse-grained account would say about Paul's case that his shutting down of the engines (*s*) took place later than his moving his arm (*m*), so that these have different properties: *m* occurred at *t*, *s* at *t* + *n*, so that $m \neq s$. A proponent of the coarse-grained account of course maintains that *s* really did occur at *t* if *m* did. They claim that our tendency to suppose otherwise is explained by our confusing s with the effect in terms of which we think of it. (The engines' shutting down is an effect which indeed occurred later than the action, they say.) A related objection relies on intuitions about when tensed sentences such as 'He has shut down the engines' are first true. Here the coarse-grained account's proponent allows the relevant intuition: this sentence is not true until some time later than 'He has moved his arm' is first true. But, they say, the truth of 'He has shut down the engines' requires more than the past occurrence of the event *s*: it also requires the past occurrence of the engines' shutting down.

The coarse-grained account joins with a definition of 'an action' as 'someone's intentionally doing something' to give intuitively right results. Suppose that Paul's shutting down of the engines was a terrible mistake, and that he was responsible for an accident. We understand how we can think of Paul as an agent in respect of something he did quite unintentionally, when we appreciate that his doing one thing was (the same as) his doing another. One thing he did was to shut down the engines, and he did this accidentally; but his doing this was his depressing of the lever, and depressing the lever was something that he did intentionally. For an event actually to have been an action of some person's according to the definition, it has to be true only that at least one of the things they did was something they intentionally did.

This criterion of actionhood is sometimes put by saying that an action has to be 'intentional under one of its descriptions'. 'Under a description' has wide philosophical currency. But it can be misleading. When 'doing things under descriptions' is employed, it is made to seem as if there were these things people do, and that *they* have various descriptions. Things people do do not have various descriptions, however: people's *actions* have various descriptions, and these descriptions correspond one:one with the things, or acts, that they then do.

2 'Basic acts'

Acts are done by doing other acts. But not *every* act someone does could be done by doing some different one, or nothing would ever get done. Among the things that a person does on occasion, then, there must be something which is *simply* done - not done by doing something else. This has been called the basic act. Where someone Φs by Ψ-ing, Ψ-ing is said to be *more basic than* Φ-ing; and the basic act is defined as the one than which no other was more basic.

Moving the body (that is, moving a bit of it in one or another way) is usually a basic act. When Mary raises her right arm directly - in order to vote at the meeting - raising the right arm is the basic act. But in the unusual case in which someone raises their right arm by lifting it with their left arm, raising the right arm, although a bodily act, is not the basic one. (What is basic here is moving the left arm.) Such an example shows that in order to say what was basic in a particular case, one has to know not only what bodily movements occurred in that case but also what was actually done by doing what else. Acts, then, are not basic *tout court*. Relative to Mary's action, but not relative to the action that was someone's raising their right arm 'indirectly', raising the right arm is basic.

The need to think about applications of basicness in connection with particular cases has sometimes given rise to talk of basic *actions*. But such talk conflicts with the coarse-grained account of actions' individuation. Where a person's raising their arm is considered to be identical to their voting, it cannot be supposed that their raising their arm is basic and their voting is not. If a notion of a basic act that is not relativized to particular cases is wanted, we have to think about what someone *can* do directly. (The person who used their left arm to raise their right arm might, or might not, have been *able* to simply raise their right arm.) Using a notion of a basic *ability*, we could speak of things as basic for a person with a particular repertoire of motions (not relative to any particular action now).

We encounter relations of dependence when we go through a list of more and more basic acts. Considering Paul's action, and going through his various acts - causing an accident, shutting off the engine, depressing the lever, moving the arm - it is natural to think of what is less basic as depending on what is more basic. We may think of

all the dependencies as causal ones in the particular example. But there are different kinds of dependence, and when the different kinds are distinguished, different relations of 'more basic than' can be distinguished. For example if we take it that a convention must obtain for someone's raising their arm to count as their voting, we could say about Mary's action that voting was *conventionally* more basic than raising the arm.

The thought that moving the body is basic seems now to be the thought that moving the body does not usually depend upon anything else - neither causally, nor in any other way. And yet physiologists tell us that, in fact, our bodily movements depend upon our muscles' contractions - that we move our bodies by contracting our muscles. It seems, then, that even where someone simply moved their arm we have a candidate for a more basic act than moving the arm - namely, contracting muscles. In fact, what this shows is that the perspective of an agent is ordinarily assumed in thinking about what is done; when moving the body is taken as basic, the focus is on things that the people might think of themselves as doing. A different notion of *basicness* is needed to accommodate the facts that the shift to a physiologists' perspective reminds us of. To allow for the fact that moving the body depends upon other things being done, a 'purely causal' notion of basicness may be introduced. This is not the intuitive, central notion that recapitulates the idea of what someone 'simply does' or 'does directly'. Philosophers have meant a variety of different things by 'more basic than'.

3 Volitional theories: actions, parts and causes

Events like muscles' contractions, which occur beneath the body's surface, come to notice not only in our thinking about different ideas of basicness: they may be prominent also when we enquire what precise causal story should be told about any action. And it is not only physiological thinking which makes philosophers want a precise causal story: a definition of 'an action' as 'someone's doing something intentionally' belongs with a view which distinguishes actions from other events by reference to a particular sort of psychologically specifiable causal history. On this view, a person who does something intentionally does the thing because they have a reason to. Saying what their reason was requires knowing what their relevant beliefs and desires were (see Belief; Desire; Intention); and it provides a distinctive kind of explanation of why they did the thing (see Reasons and causes). But it may be asked whether there is not a more immediate causal story to be told about an action than that which shows up in a reason explanation. Do actions have immediate mental antecedents of a certain sort?

It has sometimes seemed that actions must have such antecedents, because wanting, believing and intending all seem inadequate to explain actually doing something. Suppose you want to move your arm. Your arm doesn't move until … what? 'Until there is a volition' was an answer often given in the eighteenth and nineteenth centuries: philosophers often posited volitions, or acts of will (as they are alternatively called), as events which initiate the causal process of acting, bridging the gap between wanting and doing. This was a gap between the mind and the body in the thinking of dualists (see Dualism; Will, the).

Volitions fell out of philosophical favour when Ryle objected to them as spurious (Ryle 1949). Ryle asked why 'the Will' has to be exercised in action at all, thinking that the postulation of volitions was a hangover from the idea of a 'ghost in the machine'. One of his arguments against volitions posed a dilemma: either volitions are themselves 'active', or they are not. If they are 'active', then if a volition really were required for a genuine action, we should always have to posit a new volition as cause of any volition, and we should be led to an infinite regress. If, on the other hand, volitions are not themselves 'active', but are mere causes of actions, it is hard to see why anyone should think that their introduction helps in recording what is special to action.

Some volitional theories rather obviously escape this objection. John Stuart Mill, for instance, thought that an action was 'a series of two things; the state of mind called a volition followed by an effect' (Mill 1843: I 3.5). In its twentieth-century guise, the Millean theory takes an action to be composed from (a) a volition (b) a movement of a bit of the body of the person whose volition it is. On this theory, Ryle's question as to whether a volition itself, or only its effect, is 'active' has no simple answer, since each of these things is a *part* of an action. But Ryle's underlying question may still be pressed: 'Why posit a sort of mental item such that actions are present only when an item of that sort is a cause?'

The account of volitions as parts of actions draws attention to the distinction between *actions*, each one of which is someone's moving a bit of their body, and *bodies' movements*, each one of which is a bit of someone's body's moving. (The thesis which is often used to summarize the coarse-grained view of actions' individuation - that

actions are bodily movements - is now seen to be crucially ambiguous at best.) When this distinction is made, there are two other views about bodies' movements, both different from the Millean, componential view. (A) Actions are identical with bodies' movements, so that, for instance, a person's raising their arm is their arm's rising. (B) Bodies' movements are not even parts of actions, so that a person's arm's rising is wholly distinct from their raising it. (A) is implausible inasmuch as it seems to sever the connection between acting and doing something; unless a person's arm's rising is itself the person's doing something, that connection is broken when movements are identified with actions. (B) is a more plausible view - at least for the philosopher who think that actions are described in terms of their effects; for the latter, a person's arm's going up can be the effect of their raising it, just as a flag's going up is the effect of someone's raising the flag.

According as (A) or (B) is accepted, the doctrine that volitions cause bodies' movings turns out differently. When bodies' movings are thought to be actions, volitions are conceived in the manner Ryle found objectionable - they are thought of as the last item in a mental causal chain leading outward to something physical. But when bodies' movings are thought to be *no parts* of actions, the theorist can say that a volition causes a body's movement and is itself an action. When that is said, an item is recognized the status of which is ineluctably *psychophysical*, being both a volition and an action; the theorist may refuse any picture in which the mental can be marked off from the physical on a causal chain. It remains a good question why one should suppose that there is a faculty of the Will the products of which, volitions, have to be brought into an account. But when volitions are identified with actions, we can be certain at least that there is nothing mythical or 'ghostly' about them.

The claim that physical actions are redescribable in recognizably psychological terms is made not only by philosophers who say that actions are volitions, but also by others who have no truck with volitions. Some philosophers argue that anyone who does something intentionally *tries to* do it. (They allow that one need not *think of* oneself as trying to do the things one does intentionally, and they allow that 'They tried to do it' is not usually a natural thing to say about someone who encountered no difficulties and who did not need to make any special effort.) If that is correct, then, given a coarse-grained view of individuation, each action *is* someone's trying to do something. One may arrive at an account in which a person's having a reason to do something leads to their trying to do it; when their trying to do it has the effects they want (as usually it does), it is their doing the thing. To the question 'Your arm doesn't move until … what?', the answer now could just as well be 'Until you move your arm' or 'Until you try to move it' (see Mental causation).

4 Agents' experience and knowledge

When the Will features in accounts of action, it may be thought of, in Cartesian spirit, as something the operations of which are available only to introspection (see Introspection, psychology of; Private states and language). One of the ideas to which Ryle was objecting in his attack on volitions was the idea that for each visible action of a person there is an inner item accessible to them alone. Now, although we may not wish to describe our experience of agency in Cartesian terms, it seems undeniable that there is consciousness of voluntary agency. If volition is thought of as action's conscious aspect, then it is not an invention of philosophers but a feature of everyone's experience. So it could be correct to suppose that volition is a part of the phenomenon of action, even if it should be denied that *each* action has *a* volition as a part or as a cause.

A person who is doing something intentionally knows what they are doing - or, if they do not know this, they know at least what they are trying to do; and they know this without making observations of themselves of a kind that others can make. The experience of acting, which is the basis of such knowledge, is not just proprioceptive experience (it is not just experience got from information fed back from the body about the body when the body is moved). So the idea of a distinctive conscious state contemporaneous with an action seems correct. There is little agreement about how such an idea should be recorded in an account. Sometimes the content of the experience of acting is spoken of in terms of 'exertion', which can make it seem as though some actual effort were always required to move a bit of the body. But if the idea of experienced exertion is meant only to capture the fact that it would feel very differently to us if we did not move our bodies voluntarily, it is acceptable. Suppose that you were wired up in such a way that your efferent neural pathways could be so stimulated that your muscles would contract and your finger move when some other person determined that this should happen. Of course there would not be an action of your moving your finger in that case; but also, we think, the characteristic experience of agency would be missing.

Such experience, it might be thought, is present in all conscious creatures who do things - whether or not they are rational agents who do things intentionally. If that is right, it may be necessary also to record another kind of experience, which is peculiarly human now, and which may be called the experience of freedom, or the sense of alternative possibilities (see Free will §5). Thinking of agents as conscious subjects can remind us of how narrowly focused the philosophy of action becomes when it is concerned exclusively with questions of actions, events and individuation, basic acts and volitional theories (see Consciousness).

5 Philosophy of action applied to ethics and law

There is another sort of narrowness in accounts of action that confine themselves to a conception of actions as a species of events. In marking out a class of actions, and investigating how these relate to volitions, movements, etc., the philosopher does not start to address many of the conceptual questions that are asked about action by the legal, or moral, philosopher. An ordinary concern with human action is not a concern with which events occur, but is a concern with what people do. (A fine-grained ontology, of ‘act tokens’ or ‘tropes’ is sometimes introduced in order to reflect this ordinary concern.)

Arguably ‘intentionally’ is the only piece of psychological vocabulary needed to characterize the actions, when actions are taken to be a species of events (see above). But resources beyond ‘intentionally’ are certainly required to make the many distinctions needed to understand lawyers’ accounts of *mens rea* and moral philosophers’ accounts of responsibility. In considering someone’s culpability, it is not enough to consider those of their attitudes which constitute their reason for doing what they do and which connect with what they do *intentionally*. One might need to know, for instance, whether some effect that was not intended by them as a means was or was not one which they *foresaw* as resulting from their choice. (Did Paul know what he was doing when he unintentionally shut down the engines?)

For a person to be praised or blamed as an agent there need not be any event which is an action of theirs. There are cases, for example, where someone intentionally does not do something (Jane intentionally did not answer the question, say), and where although ‘intentionally’ applies, its application is not to any *event* (there is no *event* which is Jane’s not answering the question). There are other cases where an agent is held responsible for some effect in the world, but where none of the things they did or did not do was something they *intentionally* did, or did not, do. Legal conceptions of recklessness, negligence, or strict liability would all introduce examples in this category (see Moral agents; Responsibility).

Questions asked in legal and moral philosophy require a more broadly-based conception of the phenomena of agency than the action/theoretic account on its own can provide.

Adorno, Theodor Wiesengrund (1903-69)

Philosopher, musicologist and social theorist, Theodor Adorno was the philosophical architect of the first generation of Critical Theory emanating from the Institute for Social Research in Frankfurt, Germany. Departing from the perspective of more orthodox Marxists, Adorno believed the twin dilemmas of modernity - injustice and nihilism - derived from the abstractive character of Enlightenment rationality. In consequence, he argued that the critique of political economy must give way to a critique of Enlightenment, instrumental reason.

Identity thinking, as Adorno termed instrumental rationality, abstracts from the sensory, linguistic and social mediations which connect knowing subjects to objects known. In so doing, it represses what is contingent, sensuous and particular in persons and nature. Adorno's method of negative dialectics was designed to rescue these elements from the claims of instrumental reason. Adorno conceded, however, that all this method could demonstrate was that an abstract concept did not exhaust its object. For a model of an alternative grammar of reason and cognition Adorno turned to the accomplishments of artistic modernism. There, where each new work tests and transforms the very idea of something being a work of art, Adorno saw a model for the kind of dynamic interdependence between mind and its objects that was required for a renewed conception of knowing and acting.

1 Life

Theodor Wiesengrund-Adorno (Wiesengrund, his father's name, shrank to the initial W. during his exile in California in 1943) was born in 1903 in Frankfurt. From his mother and sister the young Adorno derived his lifelong passion for music. Near the end of the First World War, Adorno began spending his Saturday afternoons studying Kant's *Critique of Pure Reason* with the social critic and film theorist Siegfried Kracauer. Under Kracauer's guidance, Adorno came to experience the first *Critique* not as mere epistemology, but ' as a kind of coded text from which the historical situation of spirit could be read' (1992: vol. 2, 58). This method of reading and thinking, entwining epistemology with social physiognomy, became the constitutive gesture of Adorno's philosophy.

After completing a dissertation on Edmund Husserl's phenomenology, Adorno received his doctorate from the Johann Wolfgang Goethe University in 1924. In the following year, he travelled to Vienna to study composition with Alban Berg and involve himself with the circle of composers and musicians gathered around Arnold Schoenberg. His Vienna interlude was to have a lasting impact; not only did he become a leading advocate of the 'new music', but his philosophical style can be traced to the 'atonal' compositional techniques of Schoenberg and Berg.

Returning to his studies in Frankfurt, Adorno took his habilitation with a thesis published as *Kierkegaard: Konstruktion des Ästhetischen (Kierkegaard: The Construction of the Aesthetic)* (1933). In this difficult work, three themes that were to remain decisive emerge: (1) the criticism of existentialism as betraying its desire for concreteness by transforming existential elements into abstract categories, such as that of subjectivity in Kierkegaard (Adorno continued to make an analogous criticism of Heidegger's notion of 'being'); (2) a reading of the social world as reified, that is, a world in which institutions indifferent to the claims of subjectivity dominate over persons; (3) the attempt to provide a historical and materialist concretization of theological ideas.

Adorno fled Hitler's Germany in 1934 to Merton College, Oxford. During his three and a half years in England, Adorno wrote articles for the house journal of the *Institut für Sozialforschung* (Institute for Social Research), which was then under the direction of his friend Max Horkheimer (see Frankfurt School), and worked on a book on Husserl, which was eventually published in 1956. Adorno spent the war years in the USA. During that time he collaborated with Horkheimer on *Dialektik der Aufklärung (Dialectic of Enlightenment)* (1947), often regarded (not altogether accurately) as *the* statement of first-generation critical theory (see Critical theory).

After the war, Adorno returned to Frankfurt to help rebuild the Institute. Over the next twenty years he produced a stream of works of musical and literary criticism, social theory and philosophy. His 1957 article 'Sociology and Empirical Research' is now regarded as the initiator of the 'positivist dispute' that raged in Germany in the 1960s, with Adorno and Karl Popper as the main combatants. Adorno's two major philosophical works, *Negative Dialektik (Negative Dialectics)* (1966) and *Ästhetische Theorie (Aesthetic Theory)* (1970), were written during this

period, the latter published a year after Adorno's death.

2 For and against Marx

Adorno's philosophy is a response to his understanding of the social world he inhabited. Adorno never doubted that advanced, Western societies were structured by capitalist relations of production as analysed by Marx. In particular, he accepted Marx's account of commodity fetishism and the domination of use values by exchange value. Adorno also accepted the proposal that the same mechanisms structuring the economy were effective in structuring cultural practices. While domination and poverty (broadly speaking, injustice) are the central consequences of capital's rationalization of the economy, alienation and meaninglessness (broadly speaking, nihilism) are the central consequences of its rationalization of culture (see Alienation; Nihilism).

However, against the background of the rise of fascism in Europe and the dissolution of workers' movements, later augmented by the events of the Holocaust, Adorno came to doubt that there really were significantly progressive tendencies latent in the economic and social fabric of the modern world. On the contrary, he came to believe that the rationalization of modern societies was all but complete, and hence came to view Marx's theory of history, with its commitment to an intrinsically progressive developmental sequence of social formations, as drawing on the same structures of rationality as those governing capitalist processes of production. If it is those structures of reason and rationality that are at the roots of the deepest dilemmas of modernity, then the crisis of modernity is primarily a crisis of reason. What is thus required before all else is a critical diagnosis of modern reason; in criticizing this formation of reason Adorno is simultaneously criticizing the world it engenders and providing the terms for a radical transformation of that world.

3 A genealogy of reason

It is modern scientific rationality, with its commitment to the primacy of method, analysis, subsumption, universality and logical systematicity, that Adorno believes is at the centre of the modern crisis of reason. He contends that knowing and its objects become deformed or distorted when reason is defined in terms radically independent of the objects to which it applies, where by 'objects' Adorno means not just objects known, but equally the sensory images of those objects, the articulation of those images in language, the entanglement of natural languages in social practices and the complex histories of those practices. Each of these items could be regarded as a systematic source of error (and in the course of the emergence of modern, enlightened rationality was so regarded), from sceptical worries about the deliverances of the senses to concern about collective prejudices sedimented in linguistic and social practice (see Descartes, R.; Bacon, F.). With respect to the theory of rationality, anxieties about these sources of error led to the view that reason must be fully autonomous, and not determined by anything external to it. It is this thought that underlies the primacy of method. In the theory of language, the same project is pursued in the attempt to eliminate opacity, indeterminacy and vagueness from the meaning of concepts; this is the project of positivism and the analytic tradition generally.

Dialectic of Enlightenment aims to provide a genealogy of enlightened rationality. Enlightenment opposes myth, the enchantment of the natural world through the projection onto it of human fears and hopes. The presumed superiority of reason over myth is hence its freedom from anthropomorphic projections; reason depicts the world objectively rather than through subjective projections. Horkheimer and Adorno contend that this flattering self-image of reason is both formally and substantively fallacious. Both myth and reason emerge in the course of humankind's struggle to free itself from bondage to mythic powers (themselves projections of primordial fear of the natural world in which humankind was immersed) and to gain control over the natural world in order to satisfy human needs and desires. Both myth and reason employ the principle of immanence, the explanation of every event as the repetition of a given pattern or law (what Adorno elsewhere calls 'identity thinking'), in order to combat fear of the natural world by bringing it into an explicable order. Repetition, 'the new is the old', originally provides for conceptual control over the natural world by revealing an intelligible order and eventually, through the technological application of modern science, for actual control over the natural world. Hence the formal features which provide for the supposed autonomy of enlightened reason are in fact grounded in the anthropogenesis of human reason in its struggle with nature. Enlightened reason is not objective, but subservient to the human desire to control nature; such reason can be construed as the discursive embodiment of the human drive for self-preservation, and hence as instrumental.

4 Nonidentity and negative dialectics

Enlightened reason is premised on a false inference: because some false beliefs (myths, superstitions and the like) are subjective projections, then the medium of those projections (sensory images, language, social practices and history) must themselves be systematic sources of error. Complete independence from these mediums is thus taken to be a condition for true knowledge. This drive for independence is most fully elaborated in the writings of the German Idealists, above all Kant and Fichte, where the autonomy of reason and the meaning-independence of concepts become explicitly identified with the spontaneity of the 'transcendental' subject. Unknown to itself, this subject and the philosophical concept of system it subtends are still in the throe of the drive to self-preservation, their abstract conceptuality still harbouring both fear and rage against their objects. The conception of idealism as rationalized rage is Adorno's appropriation and transformation of Nietzsche's notion of *ressentiment*. Idealist rage is directed at anything that refuses to fit or, in Adorno's terminology, is nonidentical with the demands of autonomous reason. Because the autonomy of reason is secured through the meaning-independence of concepts from concrete experience and its mediums, then what is incommensurable with this reason is whatever is irredeemably particular and contingent. The goal of Adorno's philosophy is the 'rescue' of nonidentity - the thing in itself in its concrete, historically mediated sensuous particularity.

Adorno's method of rescue is the use of dialectic. The point of dialectical analysis is to demonstrate that the rationalized concept of an object does not exhaust the thing conceived. It attains this end by showing that what were conceived to be extrinsic encumbrances on reason (sensory images and so on) that could be stripped away in its attainment of autonomy are in fact the *necessary mediations* through which knowing subjects come into relation to objects known. Adorno borrowed this conception of dialectic from Hegel. Adorno construes his dialectic as 'negative', in opposition to Hegel, because, on the one hand, he believes that Hegel's 'system' collapses back into the kind of identity thinking that dialectic opposes; and, on the other hand, because he believes that dialectical analysis only works under conditions in which the mediations it elaborates are systematically, in theory and in practice, denied.

Because an alternative conception of reason is not currently available, despite being a real historical possibility, Adorno's philosophy is utopian. Cognitively and practically, utopia is conceived of by Adorno 'as above identity and above contradiction; it would be a togetherness of diversity' ([1966] 1973: 150). An image of such 'togetherness of diversity' is provided by modernist works of art.

5 Aesthetic theory

Adorno argues that distinctly modernist works of art exemplify the possibility of an alternative grammar of reason and cognition. He focuses on modernist works - atonal music, abstract painting, 'absurdist' literature (particularly Kafka and Beckett) - because these works self-consciously attempt to establish their aesthetic validity, and hence their objectivity, in explicit opposition to all existing norms for artistic production and all established criteria in accordance with which art works have been judged. Existing norms and established criteria are the equivalents in art to the demands of method in science. Enlightened reason has it that such norms and criteria, in science and art, are spontaneous products of reason itself. Success for a modernist work is for it to be compelling, demanding aesthetic attention and assent, in excess of established criteria of aesthetic value and, even more radically, in excess of all criteria which heretofore have constituted what it is for an item to be a work of art.

'The falsehood opposed by art,' Adorno argues, ' is not rationality *per se* but the fixed opposition of rationality to particularity' ([1970] 1997: 144). The binding of rationality to what occurs in particular cases refutes the thesis of the meaning-independence of concepts from their objects and the autonomy of reason, and hence the principle of immanence. That this refutation occurs in art works entails that such binding is only a semblance or image of an alternative grammar of reason, since in modernity art is no longer a rationally legitimated vehicle of representation; art works now are 'meaningful' wholes without external purpose. That what happens in art can none the less matter to rationality generally derives from the hypothesis that the language of art and the discourse of rationality outside the artworld are not mutually indifferent language games. Rather, art picks up the debris of nonidentity left over from rationalization processes outside art; it is the refuge of the nonidentical. Further, art is driven to its modernist extremes of atonality, abstraction and absurdity in order to sustain itself as *art*, unique works of contemplation, in opposition to the recurrent demands of the principle of immanence.

Adorno's philosophical practice explicitly binds itself to the practices and fate of artistic modernism, and in this he is being self-consistent. Adorno aims to expose philosophy, the attempt to ground rationality and cognition, to its nonidentical other, forcing philosophy to surrender its claim to autonomy and meaning-independence. This is an avowedly peculiar terminus for a radical philosopher: defending the claims of the victims of history by forging an alliance between philosophy and high modernist art.

This state of affairs links together with the three dominant lines of criticism of Adorno's thought: (1) it is unduly pessimistic about the emancipatory potential of modern liberal societies; (2) it turns its face against the call for praxis indigenous to the Marxist tradition; (3) it provides only an aesthetic alternative to current problems and conceptions of reason. Although it will remain a matter of dispute, it can be argued that these objections simply bypass Adorno's original insight, namely that the dilemmas of injustice and nihilism have a common root in the abstractive achievements of autonomous reason. Traditional Marxism focuses on the question of injustice, while ignoring the problem of nihilism; conversely, existentialists such as Nietzsche and Heidegger aim to overcome nihilism while they remain insensitive to the claims of justice. If Adorno is correct in maintaining that these dilemmas are interconnected, then his philosophy has something to say to us. The fragile hope of his philosophizing lies in the belief that the claims of justice are best served through the defence of the claims of the rationality inherent in modernist works of art.

List of works

Adorno, T.W. (1933) *Kierkegaard. Konstruktion des Ästhetischen*, Tübingen: J.C.B. Mohr; trans. R. Hullot-Kentor, *Kierkegaard: Construction of the Aesthetic*, Minneapolis, MN: University of Minnesota Press, 1989.(This is Adorno's first major work, and it includes all the major themes - the critique of existentialism as abstract, the role of aesthetics, the thematics of sacrifice - that will come to dominate his thought. The introduction to the translation by Hullot-Kentor is helpful.)

Adorno, T.W. and Horkheimer, M. (1947) *Dialektik der Aufklärung*, Amsterdam: Querido; trans. J. Cumming, *Dialectic of Enlightenment*, London: Allen Lane and New York: Herder & Herder, 1972.(This is the founding document of first-generation Critical Theory in which the critique of instrumental reason comes to displace the critique of political economy. It includes Adorno's famous treatment of Odysseus as already enacting the Enlightenment sacrifice of the particular to the universal, and his analysis of the culture industry.)

Adorno, T.W. (1949) *Philosophie der neuen Musik*, Tübingen: J.C.B. Mohr; trans. A.G. Mitchell and W. Blomster, *Philosophy of Modern Music*, Sheed & Ward, 1973.(Adorno's classic defence of Arnold Schoenberg's twelve-tone system as the high point of musical modernism. Its conception of modern music was the crucial source for Thomas Mann's *Doctor Faustus*.)

Adorno, T.W. (1951) *Minima Moralia. Reflexion aus dem Beschädigten Leben*, Frankfurt: Suhrkamp; trans. E.F.N. Jephcott, *Minima Moralia: Reflections from Damaged Life*, London: New Left Books, 1974.(One hundred and fifty-three dazzling aphorisms, in which Adorno reflects on the vanishing of concrete, individual experience in modern, bourgeois society. Its fluent mixture of philosophy and cultural criticism makes it the most accessible of Adorno's works.)

Adorno, T.W. (1956) *Zur Metakritik der Erkenntnistheorie. Studien über Husserl und die phänomenologischen Antinomien*, Stuttgart: Kohlhammer; trans. W. Domingo, *Against Epistemology: A Metacritique, Studies in Husserl and the Phenomenological Antinomies*, Oxford: Blackwell, 1982.(A dense reading of Husserl's phenomenology, with the emphasis on the inevitable abstractness of the phenomenological method, and hence its loss of the very concreteness it seeks.)

Adorno, T.W. (1957) 'Sociology and Empirical Research', in T.W. Adorno *et al.*, *Der Positivismusstreit in der deutschen Soziologie*, Neuwied and Berlin: Luchterhand, 1969; trans. G. Adey and D. Frisby, *The Positivist Dispute in German Sociology*, London: Heinemann, 1970.(Includes essays by Popper, Habermas, Dahrendorf, Harald Pilot and Hans Albert, among others. The translation also includes a review of the original by Popper, and a helpful introduction by David Frisby.)

Adorno, T.W. (1963) *Drei Studien zu Hegel*, Frankfurt: Suhrkamp; trans. S.W. Nicholsen, *Hegel: Three Studies*, Cambridge, MA, and London: MIT Press, 1993.(These very essayistic explorations of Hegel elaborate the competing ideals of rationality in dialectical and deductive thinking.)

Adorno, T.W. (1964) *Jargon der Eigentlichkeit. zur deutschen Ideologie*, Frankfurt: Suhrkamp; trans. K. Tarnowski and F. Will, *Jargon of Authenticity*, London: Routledge & Kegan Paul, 1973. (Adorno's fiercely

critical account of Martin Heidegger's existentialism as abstract and ahistorical.)

Adorno, T.W. (1966) *Negative Dialektik*, Frankfurt: Suhrkamp; trans. E.B. Ashton, *Negative Dialectics*, London: Routledge & Kegan Paul, 1973.(This work pursues an immanent critique of the idealism of Kant and Hegel as the vehicle for a critique of modern instrumental reason. It contains Adorno's most sustained arguments concerning the nature of human conceptuality, and his famous reflections on the meaning of philosophy 'after Auschwitz'.)

Adorno, T.W. (1970) *Ästhetische Theorie*, Frankfurt: Suhrkamp; trans. R. Hullot-Kentor, *Aesthetic Theory*, London: Athlone Press, and Minneapolis, MN: University of Minnesota Press, 1997.(Arguably this is the premier work of twentieth-century philosophical aesthetics and the philosophy of art. Transforming the central concepts of modern aesthetics accordingly, Adorno contends that the works of high modernism model a suppressed conception of human rationality that challenges that of Enlightenment rationalism.)

Adorno, T.W. (1992) 'The Curious Realist: On Siegfried Kracauer', in *Notes to Literature*, trans. S.W. Nicholson, New York: Columbia University Press.(Adorno's account of the thought and influence of his early tutor.)

Zuidervaart is critical of Adorno's strong cognitivist approach to art.)

Adverbs

Adverbs are so named from their role in modifying verbs and other non-nominal expressions. For example, in 'John ran slowly', the adverb 'slowly' modifies 'ran' by characterizing the manner of John's running. The debate on the semantic contribution of adverbs centres on two approaches. On the first approach, adverbs are understood as predicate operators: for example, in 'John ran slowly', 'ran' would be taken to be a predicate and 'slowly' an operator affecting its meaning. Working this out in detail requires the resources of higher-order logic. On the second approach, adverbs are understood as predicates of 'objects' such as events and states, reference to which is revealed in logical form. For example, 'John ran slowly' would be construed along the lines of 'there was a running by John and it was slow', in which the adverb 'slowly' has become a predicate 'slow' applied to the event that was John's running.

Since adverbs are exclusively modifiers, they are classed among the syncategorematic words of terminist logic, the investigation of which carried the subject forward from Aristotle in the thirteenth century. (The contrasting 'categoremata' - grammatical subjects and predicates - are those words which have meaning independently.) They are of contemporary interest for philosophical logic and semantic theory, because particular accounts of them carry implications for the nature of combinatorial semantics and language understanding, and for ontology.

1 Syntactic types and semantic combination

There are several types of adverbial constructions, of which we distinguish the following classes: (a) 'manner' adverbs, which intuitively function as simple modifiers of verbs; (b) 'thematic' adverbs, of which some and possibly all function as (at least) two-place predicates in their own right; (c) adverbs of quantification, which express generality applying to whole sentences; and (d) discourse particles, whose meaning evidently derives from their role in linking clauses or independent sentences. (These categories are not exhaustive.) 'Adverbs', especially manner 'adverbs', are not in fact confined to single words. The general category is therefore not that of adverbs, but of adverbial phrases or adverbials (for example, 'more quickly than Mary', 'very frequently').

Typical manner adverbials are as in (1) below, thematic adverbs as in (2) and adverbs of quantification as in (3):

(1) John walked slowly/quietly/more quickly than Mary.
(2) Mary apparently/reluctantly went to New York.
(3) Mary occasionally/always walks to work.

Discourse particles, considered briefly below, include 'but', 'anyway' and several others. We discuss these cases in turn.

The essential logical problem of manner adverbials is already apparent in the simplest examples. A verb combines with a manner adverb to form a complex verbal construction of the same type. Thus 'walk' and 'walk slowly' are both predicates, and the syntax of the combination may be depicted as follows:

$[_V [_V \text{walk}][_{Adv} \text{slowly}]]$

If (disregarding tense) we take 'walk' as a one-place predicate, then the semantics of this combination might be given by positing that 'slowly' is interpreted as a predicate operator; that is, as a function that maps one-place predicate interpretations onto other one-place predicate interpretations. Alternatively, it may be suggested that 'slowly' and the other manner adverbials are, logically speaking, predicates in their own right, specifically predicates of actions. The adjectives to which they are related do seem to play this role. Corresponding to (1), for instance, we have the adjectival predications

(4) John's walk was slow/quiet/quicker than Mary's.

If we take the further step of supposing that the verb 'walk' is in fact a two-place predicate, with a position for actions, then the combination 'walk slowly' can be interpreted as

walk(x, e) & slow(e),

where *e* ranges over actions. Comparing this account with the first alternative,

(slowly(walk))(*x*),

we see a trade-off: where predicates are taken to have a simple structure, the adverbial must be understood as an operator; but where extra structure, in the form of a place for actions, is posited, the semantic combination is truth-functional and predicate operators are not required.

The alternatives just sketched each have their defenders in the literature on adverbials. Adverbs are construed as predicate operators in formal theories of linguistic structure, including those of Montague (1974) and Lewis (1975). The predicative alternative was first advanced at length by Davidson (1967), and is elaborated by Parsons (1990). Semantic and metaphysical issues arise for each account; we take up some of these below.

Thematic adverbs are intuitively distinguished from manner adverbs in as much as they yield constructions adverb + verb which cannot be treated simply as new verbs: apparently going to New York is not a way of going to New York; and reluctantly going to New York is not a manner of travel, but an instance of travel whose agent was reluctant to undertake it. For the examples in (2) the following paraphrases suggest themselves:

It was apparent that Mary went to New York.
Mary went to New York and she was reluctant to go to New York.

The discourse particles, traditionally and appropriately called adverbs, have come under relatively formal study only in recent years. The following examples are representative:

(5) He was poor *but* honest.
(6) *Anyway*, I’m going to New York.

They resist analysis in terms of their contribution to truth-conditions, but carry implications for the discourses in which they occur, with (5) involving some presumptive contrast with what might have been expected and (6), as an assertion, functioning to indicate a return to a superordinate topic of conversation. See Levinson (1983) for examples and discussion.

2 Ambiguities

Many adverbs are ambiguous between thematic-adverbial and manner-adverbial interpretation. In an example such as

(7) Mary quickly objected,

we may have either the interpretation ‘Mary’s objection was delivered in a quick manner’ or the interpretation ‘Mary’s objection came a short time after the enunciation of the proposition to which she objected’. The second, thematic-adverbial interpretation shows up in the corresponding adjective ‘quick’ in a construction such as

Mary was quick to object.

These examples suggest that grammatical appearance belies logical structure, since the thematic adverbial in (7) functions, logically speaking, as the main predicate of that sentence. Austin (1956) observed that adverbial position often disambiguates, with post-verb adverbs favouring the manner-interpretation, and pre-verb adverbs the thematic, as in the pair

He trod on the snail clumsily.
Clumsily, he trod on the snail.

Adverbs of quantification pick up arguments including, but not restricted to, the temporal. Sentences such as (8) are ambiguous, depending upon whether the quantification is over occasions, or over the subject:

(8) Travel books are seldom worth reading.

Where the adverb quantifies over time, (8) means that the occasions are few when it is worth reading travel books. But there is another salient interpretation:

Few travel books are worth reading.

Where quantification over time would be ridiculous in view of the subject matter, construal of the adverb with the subject is particularly salient, for example:

Quadratic equations seldom have real solutions.

The above reflections have it that thematic adverbs and adverbs of quantification are not modifiers at all, except in a purely grammatical sense. Inversely, there have been suggestions that what appear in language as if they were arguments to a predicate actually function as adverbial modifiers. Perhaps the best known account of this type is Roderick Chisholm's discussion of a certain class of statements about appearances. Chisholm suggests that a man who 'sees spots before his eyes' should be thought of as 'sensing in a spotty manner' or as someone whom things 'appeared to spottily' (1957). This philosophical move is designed to rid the locution of any implication that in sensing spots before his eyes the man is sensing a mysterious object, an appearance, which is before him, his eyes or his mind (see Mental states, adverbial theory of). In a similar vein, Goodman ([1968] 1976) construed the locution '*x* represents an *F*', under the condition where there is no implication that such an *F* exists, as 'is an *F*-representation', effectively treating the predicate *F* adverbially.

The suggestions of Chisholm and Goodman, left as they are, become problematic if the project of giving a combinatorial semantics for language is taken seriously (see Compositionality). Suppose *x* is a picture and (9) is true, with no existential implications:

(9) *x* represents two unicorns galloping in a field.

If we write, with Goodman,

x is a two-unicorns-galloping-in-a-field representation,

then we have yet to provide a semantic structure to go along with the syntax. But there must be some such structure, since, for example, (9) obviously implies

x represents more than one unicorn in motion.

Similar issues arise for the predicate-operator theory of manner adverbs. For instance, that theory does not immediately deliver the obvious implication

(10) John walked slowly; therefore, John walked.

In Montague (1974) and much subsequent literature, this and similar implications are the consequences of semantic postulates in the sense of Carnap (1956). Even with such postulates, the relation between the adverbial constructions in (1) and their adjectival paraphrases (4) requires clarification. By contrast, the predicative theory proposed by Davidson is specifically designed to capture such implications and paraphrases. The premise of (10) is rendered as

(11) $(\exists e)$(walk(John, *e*) & slow(*e*)),

that is, 'There was a walk by John and it was slow'; and the conclusion has the form

(12) $(\exists e)$walk(John, *e*),

'There was a walk by John', a trivial implicate of the premise. For the paraphrase relation between (1) and (4), we have only to note that the complex noun 'John's walk' would be understood as a definite description of an action; that is, as '(the *e*) walk(John, *e*)'. 'John's walk was slow' then becomes

(13) slow((the *e*) walk(John, *e*)).

Given any standard treatment of the definite description, (13) will imply (11). However, the Davidsonian view is committed to supplying extra, hidden structure in all cases, and to taking events as individuals, a step that has often been considered metaphysically dubious.

Ensembles of adverbs show ambiguity of scope (see Scope). For example, one interpretation of (14) has John being clever in that he made a stupid response:

(14) John cleverly responded stupidly.

Modal adverbs such as 'necessarily' and 'contingently', which modify whole sentences, allow singular terms and quantifiers within their superficial scope to be interpreted as outside it (a point known to the terminist logicians). Tracking the relative scopes of modalities is part of the contemporary application of modal logic. As in the cases of manner and thematic adverbs, there are both operator-theories and predicate-theories of these expressions; that is, the modalities may be developed as one-place modal operators, with the same syntax as negation; or as predicates of sentences in a first-order formulation of the logical syntax of natural language (see Modal operators). Montague (1963) argued that the latter was unacceptable since the normal laws of modal logic could not all be maintained, on pain of paradox. The argument has subsequently been developed and discussed by others: see Koons (1992) for a survey and response.

3 Extensionality

Adverbial constructions of both the manner and thematic types, together with others, show a kind of superficial but persistent non-extensionality: superficial, because it may disappear under analysis; and persistent, because it may show up in places that the analysis itself uncovers. Predicate-operator theories can accept non-extensionality as the norm. Supposing, for example, that those who breathe are exactly those who perceive, it is absurd to infer that *x* perceives rapidly from the premise that *x* breathes rapidly. The predicate-operator theory, taking all operations to be in intension, has no such consequence. Or supposing that those who went to New York were exactly those who visited Times Square, it does not follow that if Mary reluctantly went to New York she also reluctantly visited Times Square.

For theories of Davidson's type, the constructions

x breathed rapidly
x perceived rapidly

are of the same logical type, but the events on which the adverb is predicated are different. The coextensiveness of 'breathe' and 'perceive' amounts to the coextensiveness of

(for some *e*) breathe(*x*, *e*)
(for some *e*) perceive(*x*, *e*).

Such coextensiveness no more implies the equivalence of '*x* breathed rapidly' to '*x* perceived rapidly' than the coextensiveness of '*x* kicked something' and '*x* saw something' would imply the equivalence of '*x* saw something red' and '*x* kicked something red'.

Non-extensionality is more troublesome when one considers events related as genus and species. For example, 'Mary flew slowly across Spain' does not imply 'Mary travelled slowly across Spain', even though any event of flying is an event of travelling. It follows that it is inadequate to represent 'Mary flew slowly across Spain' simply as

(for some *e*) (fly(Mary, *e*) & across Spain(*e*) & slow(*e*)).

Rather, we must add that the event *e*, which was a flying and therefore a travelling, was slow *for a flying*. These examples show at least that manner adverbials are relative to the sets of events against which a given event is evaluated. Other examples may show that it is not merely sets but also properties, not extensionally individuated, that form the background.

In any case, non-extensionality is evident in constructions with thematic adverbs. Davidson, following a suggestion by Hector-Neri Castañeda, considered examples such as that of

Oedipus intentionally married Jocasta,

from which it does not follow that Oedipus intentionally married his mother. In this case, the locus of non-extensionality, although due to the presence of the adverb 'intentionally', is the predicate 'intend', from which the adverb is derived. In this sense, it is independent of any peculiarities of adverbs, as in the Davidsonian paraphrase

Oedipus married Jocasta, and he intended to marry Jocasta.

Higginbotham (1989) explores a number of similar examples.

Aenesidemus (1st century BC)

Aenesidemus was a Greek philosopher of the first century BC who revived Pyrrhonian Scepticism, formulating the basic Ten Modes of Scepticism, or tropoi*, and demonstrating that concepts such as cause, explanation, goodness and the goal of life engendered endemic and undecidable dispute; faced with this the Sceptic suspends judgment - and tranquillity follows.*

Aenesidemus was probably active around the middle of the first century BC. He considered that Academic scepticism under Philo of Larissa had so far abandoned its original, uncompromising attitude to knowledge that he described the dispute between Philo and Antiochus as 'Stoics fighting with Stoics' (fr. 71C9). In response, he turned to the Scepticism of Pyrrho for sustenance, effectively re-founding Pyrrhonism and determining the broad outlines it was to follow (see Pyrrhonism). The fundamental arguments of the Ten Modes of Scepticism are attributed to him. He wrote an eight volume *Pyrrhonian Discourses*, a summary of which survives in the ninth-century patriarch Photius' library catalogue (frs 71C, 72L), and is said to have composed an *On Inquiry*, an *Against Wisdom* and a *First Introduction*.

The first book of *Pyrrhonian Discourses* argued that the Academics were in fact dogmatists, committed to beliefs both positive ('some things are plausible') and negative ('nothing is apprehensible'). Pyrrhonists, by contrast, 'determine absolutely nothing, not even this claim that nothing is determined' (fr. 71C8). They will not assert dogmatically (that is, with strong commitment to the truth) that something either is or is not the case, saying only that it no more is than is not, or that it sometimes is and sometimes is not, or that it is for one person and not for another (fr. 71C6-7) (see Pyrrhonism §§1, 3). This, according to Aenesidemus, amounts simply to following the appearances, reacting to the way things seem to be; about reality the Pyrrhonist suspends judgment, the result of such suspension being tranquillity (Diogenes Laertius, IX 106-7).

The remainder of *The Pyrrhonian Discourses* cast doubt on the concepts of dogmatist physics (cause, principle, generation, motion, and so on) (see Pyrrhonism §5) and the veridicality of perception, as well as dealing sceptically with signs, the gods, scientific explanation and various topics in ethics, the aim being to emphasize the dubiousness of all dogmatic positions on these topics and the extent of their differences, with a view to promoting suspension of judgment (and hence tranquillity). Some of these arguments are preserved elsewhere: signs should be evident as signs (that is in what they signify) to everybody if they are to function as signs, but they are not (Sextus Empiricus, *Against the Professors* VIII 215); the concept of cause is incoherent (IX 219-26); scientific 'explanations' are underdetermined (Sextus Empiricus, *Outlines of Pyrrhonism* I 180-5). Aenesidemus' Scepticism appears both consistent and complete.

Elsewhere, however, Sextus reports that 'Aenesidemus…says that the Sceptic way is a road leading to Heraclitean philosophy, since saying that opposites appear to hold of the same thing precedes saying that they actually do hold of the same thing' (*Outlines of Pyrrhonism* I 210) (see Heraclitus §3). Thus, apparently, indeterminacy in appearances is grounds for belief in indeterminacy in the objects, which is unsceptical, involving a commitment to the way things actually are. Perhaps Aenesidemus simply offered such arguments dialectically, to emphasize dogmatic disagreement; perhaps he thought (possibly following Pyrrho - see Pyrrhonism §1, and compare Pyrrho §3) that such statements were coherently Sceptical; or perhaps he simply changed his mind. The evidence is insufficient - and we can only suspend judgment on the issue.

Aesthetic attitude

It is undeniable that there are aesthetic and non-aesthetic attitudes. But is there such a thing as the *aesthetic attitude? What is meant by the aesthetic attitude is the particular way in which we regard something when and only when we take an aesthetic interest in it. This assumes that on all occasions of aesthetic interest the object attended to is regarded in an identical fashion, unique to such occasions; and this assumption is problematic. If an attitude's identity is determined by the features it is directed towards; if an aesthetic interest in an object is (by definition) an interest in its aesthetic qualities; and if the notion of aesthetic qualities can be explained in a uniform manner; then there is a unitary aesthetic attitude, namely an interest in an item's aesthetic qualities. But this conception of the aesthetic attitude would be unsuitable for achieving the main aim of those who have posited the aesthetic attitude. This aim is to provide a definition of the aesthetic, but the aesthetic attitude, understood as any attitude focused upon an object's aesthetic qualities, presupposes the idea of the aesthetic, and cannot be used to analyse it. So the question is whether there is a characterization of the aesthetic attitude that describes its nature without explicitly or implicitly relying on the concept of the aesthetic. There is no good reason to suppose so. Accordingly, there is no such thing as the aesthetic attitude, if this is an attitude that is both necessary and sufficient for aesthetic interest and that can be characterized independently of the aesthetic.*

1 The idea of the aesthetic attitude

What is meant by the aesthetic attitude? Although it has often been supposed that there is such a thing, its existence has also been denied. Those who believe in the aesthetic attitude embrace one of two conceptions: either a certain conception of the essence of *aesthetic* appreciation or interest, or a certain conception of the essence of *artistic* appreciation or interest, that is, appreciation of or interest in something *as* a work of art. Each maintains that there is a particular attitude we adopt towards an item when and only when our interest in the item is of a certain kind, and each calls this attitude 'the aesthetic attitude'; but whereas the first alternative specifies this interest as appreciation of the item from the aesthetic point of view, the second identifies it as appreciation of the item as a work of art. The first is usually understood as being the wider conception, including the second as a special case. For it is often believed that (1) aesthetic interest can be directed towards either nature or art, and (2) to be interested in a work of art *as* a work of art is to be interested in it aesthetically. But the first conception is not always thought of as wider than the second. Some thinkers deny (2), on the ground that interest in a work of art as a work of art requires more than, or something different from, an aesthetic interest in the item. And some thinkers maintain that the concept of regarding something as a work of art is basic, and that to regard nature aesthetically *is* to regard it as, or as if it were, a work of art. Without prejudging any of the issues, it will simplify exposition to focus on the first conception.

2 Aesthetic and non-aesthetic attitudes

One source of the idea that there is such a thing as the aesthetic attitude is undoubtedly the thought that any item that we can treat or regard aesthetically we can also treat or regard non-aesthetically. It is indeed true that we can adopt towards any item - even something that is a work of art - an attitude that is not concerned with its aesthetic appeal, for there certainly are non-aesthetic or non-artistic attitudes and no item necessarily precludes having an attitude of one of these kinds directed towards it. You can look at a hibiscus, not to delight in the beauty of its form and colours, but merely to see whether it needs water; and even if you are bored by Bach's *The Art of Fugue* you might listen to it in order to fall asleep. Now from the fact that for any item it is possible to adopt an attitude towards it that is not concerned with its aesthetic or artistic appeal, it is easy to jump to the conclusion that there is an attitude we adopt towards any item when and only when we take an aesthetic interest in it. This would be *the* aesthetic attitude. However, the conclusion makes a much stronger claim than the premise from which it is derived. The premise claims only that whatever you may be taking an interest in, your interest might not be in its aesthetic or artistic appeal. This does not imply the double-barrelled thesis that (1) when your interest in any item is aesthetic or artistic, your attitude towards the item must always be of the same unitary kind, and (2) whenever your attitude towards anything is of this kind, you are taking an aesthetic or artistic interest in the item. So the conclusion follows from the premise only if the premise is supplemented.

The strongest basis for the conclusion would be, first, an exhaustive specification of different kinds of attitude and,

second, a demonstration that one of these attitudes is such that (a) if any other attitude is adopted towards an item, but this attitude is not, then the item is not being regarded aesthetically (and so the attitude is necessary for aesthetic appreciation), and (b) if an item is the object of this attitude, then it is being treated aesthetically, no matter what other kinds of attitude may also be directed towards it (and so the attitude is sufficient for aesthetic appreciation). The provision of such a basis is clearly the intention of those who offer, first, a positive characterization of a certain attitude, all other attitudes being defined by contrast with this attitude (thus exhausting the possibilities), and, second, a number of examples for which, supposedly, the adoption of this attitude is both necessary and sufficient for the item to be the object of aesthetic appreciation.

If there is such a thing as the aesthetic attitude, can it be given a positive characterization that specifies its nature? Nearly all adherents of the aesthetic attitude have believed that it is susceptible of a helpful analysis, but it has also been argued that it is not.

The principal interest of the concept of the aesthetic attitude derives from a concern to define or circumscribe the notion of the aesthetic or (more usually) of art. One leading idea has been that of defining the notion of a work of art in terms of the aesthetic attitude, perhaps in such a fashion as this: a work of art is an artefact solely, mainly or at least partly designed to give satisfaction to the aesthetic attitude. But a definition of art in terms of the aesthetic attitude will be illuminating only if an understanding of the concept of the aesthetic attitude does not presuppose an understanding of the aesthetic. If the aesthetic attitude is identified merely as the attitude of concern for or interest in an item’s aesthetic properties or aesthetic value, and if a work’s artistic properties or artistic value are constituted (partly or wholly) by its aesthetic properties or value, then the suggested definition will be unhelpfully circular; and an analogous conclusion will follow if the aesthetic attitude is defined as the attitude necessary for or most conducive to the derivation of the aesthetic pleasure an object merits, or that is necessary to ensure that an aesthetic judgment about an object is as well-founded as it can be. So the question arises of whether it is possible to define the aesthetic attitude independently of any idea of the aesthetic.

I shall consider, first, the project of defining the aesthetic attitude independently of any prior concept of the aesthetic; second, the idea that although there is such a thing as the aesthetic attitude, it resists definition; and third, the claim that the aesthetic attitude is a myth.

3 Characterizing the aesthetic attitude

A recognition of truth, beauty and goodness as the principal concerns of the human mind has given rise to the idea that the aesthetic attitude must be distinguished from, on the one hand, cognitive attitudes, and on the other, practical ones. Whereas a cognitive attitude towards an object is concerned with the acquisition of knowledge from it and a practical attitude with its utility, the aesthetic attitude has a different focus. Or so it is claimed. How might this focus be defined?

In fact, only a small number of locutions have been used to characterize the aesthetic attitude. Perhaps the most common has been in terms of the notion of disinterestedness. That your attitude towards an object is disinterested does not mean that you are not interested in it. What does it mean? If ‘disinterested’ means no more than ‘unbiased’, this would not serve by itself to mark off the aesthetic attitude from paradigms of cognitive or practical attitudes, which can also be unbiased. If it means that your attitude is not aesthetic if you are interested in determining what the object is, what to do with it or its suitability for some purpose, it is wide of the mark; for, leaving other considerations aside, it rules as unaesthetic those cases in which you consider whether an object is suitable for an *aesthetic* end, such as when you consider whether a vase is the right shape, size and colour for the collection of flowers you propose to arrange.

It is sometimes suggested that something is an object of aesthetic appreciation only if it is being attended to for its own sake. This idea can be understood in stronger and weaker forms. On the one hand, ‘for its own sake’ might mean ‘for no further reason but just for the sake of it’. But this would yield a mistaken account of aesthetic appreciation, for you can have a variety of reasons for attending to something that you are appreciating aesthetically. On the other hand, ‘for its own sake’ might mean ‘not solely as a means to an end’, thus allowing for the possibility that an object is being attended to for its own sake, or as an end in itself, even when it is being attended to for ulterior purposes. If this requires a spectator’s interest in the object not to be solely concerned with some *non-aesthetic* end, it would render an account of the essence of the aesthetic in terms of the aesthetic attitude

viciously circular. But if the requirement is only that the interest should not be solely as a means to *some* end, then even if this were to be a necessary condition it would not be a sufficient one for the interest to be aesthetic. Your interest in a mathematical proof or a game of soccer is not aesthetic simply because you are uninterested in any use to which these might be put.

Another suggestion is that your attitude towards an object is aesthetic if and only if, in interacting with it, you consider just the object itself - its elements and the relations amongst its elements - not any relations in which it stands to anything other than itself. Accordingly, the aesthetic attitude is thought of as being an attitude of contemplative detachment from all considerations of utility, which focuses only on what the object is 'in itself' (its shapes and colours, for example). But, apart from any other considerations, this overlooks the fact that works of art can be designed to serve non-artistic functions and that aesthetic admiration can encompass the appearance that an object presents of its suitability for discharging these functions. This is especially pertinent to works of architecture, for which harmony of form with function is an aesthetic merit.

So none of these suggestions, either in itself or combined with another, provides a definition of an attitude that satisfies the conditions required by the concept of the aesthetic attitude.

4 Transitive and intransitive particularity

Wittgenstein drew a distinction between a 'transitive' and an 'intransitive' use of the word 'particular'. You use the word in the transitive fashion if you use it as a prelude to a description, comparison or specification of the nature of the phenomenon you are referring to - a description that you intend to produce or, perhaps, that you wish to have produced by the person you are addressing. When you use the word intransitively it is not thereby your intention to follow it up with a specification of anything. Rather, you are using it, Wittgenstein says, as what might be called an 'emphasis': either it has some such force as 'strong', 'striking' or 'impressive', or it merely gives expression to the fact that your attention is taken up with the phenomenon you are indicating.

Richard Wollheim (1980) has argued that although there is such a thing as the aesthetic attitude, which he equates with the attitude of treating or regarding something as a work of art, philosophers of art who refer to the aesthetic attitude as a particular attitude are systematically ambiguous about whether they intend a 'particular attitude' in the transitive or the intransitive sense. And he claims that despite the many attempts to give a positive characterization of the aesthetic attitude, it can be conceived of as a particular attitude only in the intransitive sense. It might seem that this is tantamount to denying the existence of the aesthetic attitude or to asserting that there is nothing distinctive of it. But, Wollheim maintains, the point is rather that 'there need not be any comprehensive way of referring to what is distinctive of it other than as the aesthetic attitude'.

But Wollheim's position receives no support from Wittgenstein's distinction. For consider saying 'Jack has a particular way of asking a favour.' If you are using the word 'particular' transitively, then you will continue in some such fashion as 'namely, he drops his eyes and then looks to see how his request has been received.' If you are using the word in the intransitive sense, you will not continue in this fashion, for you are merely expressing the fixity of your attention on the way John asks a favour. However, it does not follow from the fact that your use is intransitive that there is no particular way in the transitive sense in which Jack asks a favour. Clearly, there is: Jack's way of asking a favour can be characterized in other terms. The same holds for the remark that the aesthetic attitude is a particular attitude. The fact that the word 'particular' is here being used intransitively does not preclude a positive characterization of the nature of the attitude. Hence no reason has been given for believing that what is distinctive of the aesthetic attitude cannot be captured other than by referring to it as the aesthetic attitude.

5 Myth or reality?

Is the aesthetic attitude a myth? That depends, first, on the difference between a single attitude and a motley collection of attitudes, and, second, on what work the aesthetic attitude is supposed to do.

An attitude towards an object is a disposition to think and feel about and to behave towards it in characteristic ways. You have a hostile attitude towards someone if you are liable to think hostile thoughts about them, to experience hostility when meeting them, to avoid their company, and, perhaps, to behave in ways that are harmful to them. Now your attitude towards an object can be such that you are disposed to thoughts about its aesthetic

character, to feelings aroused by its aesthetic qualities, and to aesthetically relevant behaviour. But there is no hope of circumscribing aesthetically relevant behaviour without using the concept of the aesthetic, as can be easily seen from the fact that it might on occasion consist in nothing more than walking away from an aesthetically uninteresting picture. And neither aesthetic thoughts nor aesthetic feelings have a nature that can be specified independently of the idea of the aesthetic. Accordingly, even if the diversity of aesthetic thoughts, feelings and behaviour does not imply that aesthetic attitudes are irreducibly diverse, their unity is achieved only by bringing them under the concept of the aesthetic. So the idea of the aesthetic attitude explicated in this way - as an attitude that must be thought of as a disposition to aesthetic thoughts, feelings and behaviour - is not suited to play the foundational role it is often assigned. It does not enable a penetrating analysis of the aesthetic, but must be defined in terms of it.

The prospects are bleak indeed for specifying in non-aesthetic terms an attitude that is both necessary and sufficient for aesthetic appreciation, as my critique of the standard definitions indicates; and the idea that there is an attitude that is distinctive of aesthetic interest but that is resistant to analysis is baseless. Hence, the aesthetic attitude is either a myth or of little interest.

Aesthetic concepts

Aesthetic concepts are the concepts associated with the terms that pick out aesthetic properties referred to in descriptions and evaluations of experiences involving artistic and aesthetic objects and events. The questions (epistemological, psychological, logical and metaphysical) that have been raised about these properties are analogous to those raised about the concepts.

In the eighteenth century, philosophers such as Edmund Burke and David Hume attempted to explain aesthetic concepts such as beauty empirically, by connecting them with physical and psychological responses that typify individuals' experiences of different kinds of objects and events. Thus they sought a basis for an objectivity of personal reactions. Immanuel Kant insisted that aesthetic concepts are essentially subjective (rooted in personal feelings of pleasure and pain), but argued that they have a kind of objectivity on the grounds that, at the purely aesthetic level, feelings of pleasure and pain are universal responses.

In the twentieth century, philosophers have sometimes returned to a Humean analysis of aesthetic concepts via the human faculty of taste, and have extended this psychological account to try to establish an epistemological or logical uniqueness for aesthetic concepts. Many have argued that although there are no aesthetic laws (for example, 'All roses are beautiful,' or 'If a symphony has four movements and is constructed according to rules of Baroque harmony, it will be pleasing') aesthetic concepts none the less play a meaningful role in discussion and disputation. Others have argued that aesthetic concepts are not essentially distinguishable from other types of concepts.

Recently theorists have been interested in ways that aesthetic concepts are context-dependent - constructed out of social mores and practices, for example. Their theories often deny that aesthetic concepts can be universal. For example, not only is there no guarantee that the term 'harmony' will have the same meaning in different cultures: it may not be used at all.

1 Eighteenth-century views

Although questions about the origin and nature of our ideas of the beautiful, the proportionate, the harmonious, and so forth, can be found in ancient and medieval writings, the seat of aesthetic concepts developed in the eighteenth century was increasingly located primarily in human experience rather than in the objects of those experiences *per se*. Edmund Burke, for example, set out to explain where our ideas (and hence concepts) of the sublime and beautiful come from, and answered that they come not from objects *per se* but from objects as they are experienced (see Sublime, the §2). Thus one and the same object can be described as 'fearful' or 'sublime' depending upon the circumstances of the viewer. A building in flames is frightful if one is in the building and fears for one's life; it is sublime if one is standing across the street from it and has no fear that oneself or one's loved ones are endangered, and one can thus take pleasure (though Burke called it 'relative pleasure') in the shapes, colours and sounds, and so on. (see Burke, E.).

David Hume asserted that the existence of what are now generally referred to as aesthetic concepts depends upon human beings having the requisite psychophysical machinery for experiencing the world in certain ways. The locus of aesthetic experiences and ideas, he argued, is taste (see Artistic taste §1). This faculty not only accounts for the fact that one can claim that, say, a flower is beautiful (just as the faculty of sight accounts for the fact that one can claim that the flower is red), it also provides an empirical basis for what he calls the 'standard of taste'. Just as people with adequate colour vision and proper training will correctly apply colour concepts, that is, apply them in such a way that others with adequate vision and training will agree, so people whose taste is sufficiently sensitive and who have been correctly trained will competently apply aesthetic concepts, and will agree with other similarly competent judges.

Hume's approach exemplifies an urge to reconcile two counterintuitive forces that continue to appeal to both theorists and non-theorists in aesthetics. On the one hand there is the belief that aesthetic concepts are somehow subjective - that, as the saying goes, beauty is in the eye of the beholder. There is no guarantee that my concept of beauty will match yours, indeed there is ample evidence that one should not even hope for such agreement. Some like it cold, some like it hot, and any basis for a standard of application for evaluative concepts like

‘aesthetically good’ or ‘aesthetically bad’ seems ineluctably illusive. On the other hand, there does at least sometimes seem to be an objective basis for aesthetic concepts. We do seem to mean the same things when we talk about a beautiful sunset or suspenseful movie. If someone denied the grandeur of the Rocky Mountains, we would think less of the person, and not less of the mountains (see Hume, D.).

The drive to account for both subjectivity and objectivity is at the heart of perhaps the most systematic and influential treatment of the nature of aesthetic concepts in the history of western philosophy, namely that of Immanuel Kant. In his *The Critique of Judgment*, he provides a many-faceted definition of ‘the beautiful’ (as an exemplar of aesthetic concepts) that incorporates metaphysical, epistemological, psychological and logical analyses and which he believes reconciles the attractions of both subjectivity and objectivity (see Beauty §4).Kant, like Hume, agrees that aesthetic concepts are ‘taste concepts’, whose existence depends upon human experience. In particular, he believes that aesthetic concepts are grounded in pleasure and pain. Hence they are subjective, and any agreement between persons cannot be empirically based, as Hume had hoped. But,Kant argues, aesthetic concepts are pure in the sense that they are neither related to nor dependent upon cognitive or ethical concepts. Our feelings of pleasure or pain in the presence of an object have nothing to do with our scientific conception of the object (and are even independent of our belief that the object exists) nor with our belief that it is useful or morally good (see Art and morality §3). Since aesthetic concepts are not connected to anything special about me (what I as an individual believe about the nature of the object or its relation to my preferences or duties), I must believe that all human beings who similarly respond as human beings, and not as individuals with special histories, will react as I do - that they will similarly feel pleasure or pain in the presence of this object. Thus an aesthetic concept has a universal aspect. If I attribute beauty to a flower, I expect everyone else (to the extent that they respond aesthetically) to do so, too. Thus aesthetic concepts are subjectively located, but universally applicable, according to Kant.

2 Frank Sibley and his critics

In the twentieth century, the role of taste and the Kantian drive to distinguish aesthetic concepts from other kinds of concepts is exemplified in the writings of the influential British aesthetician, Frank Sibley. Taste, according toSibley, is a special mental faculty that enables some people to have certain perceptions and to form concepts on the basis of those perceptions. This special psychological faculty explains, he further believes, a special logic that characterizes the use of aesthetic concepts in discussion and argument.

If we observe people describing an event or object, according to Sibley, we notice that there are some features that everyone with normal eyes, ears and intelligence perceives - shape or loudness, for example. But there are also features that are perceived only by people with a special sensitivity - balance or unity, for example. These latter people are the ones who have taste. If a vase is gracefully curved, either one sees the gracefulness or one does not.

Sibley believes that this explains why aesthetic concepts are not condition-governed. That is, no list of non-aesthetic features (those perceivable by everyone) is logically sufficient for deducing that an object or event has any particular aesthetic features (those perceivable only by people with taste). Told that a vase is pink, made of glass, and fifty centimetres high, one is unable to conclude that the vase must be gracefully curved. And this is true, Sibley argues, no matter how long a list of non-aesthetic properties is provided.

None the less, Sibley argues, aesthetic concepts are objective; that is, ‘The vase is gracefully curved’ is either true or false. In this respect, aesthetic concepts are like colour concepts. Only people with adequate colour vision can see pinkness, but nevertheless we believe that the sentence, ‘The vase is pink,’ is either true or false. This is because people with normal colour vision agree about it. With respect to aesthetic concepts, agreement also provides the foundation of objectivity. People of taste agree that the vase is gracefully curved, and this is all we need to support the claim that aesthetic judgments have truth values.

Sibley’s view combines psychological, logical, epistemological and metaphysical components, and it has been criticized in all of these fields. It is often objected that ‘taste’ is a very unclear notion - certainly not adequate to support a unique logic of aesthetic concepts. Nor is it so easy to distinguish aesthetic from non-aesthetic properties (and hence the corresponding concepts). And many writers have argued that the analogy of aesthetic and colour concepts does not really support the sought-for objectivity of the former; there is nothing like the widespread

agreement that can be found for non-aesthetic qualities (on the assumption that they can be distinguished from aesthetic qualities) in the aesthetic realm. Disagreement among recognized experts in discussions of works of art is notorious.

None the less, many theorists agree with Sibley that there is something special about aesthetic concepts and that there are no 'aesthetic laws', that is, that there is no way of defining an aesthetic concept in terms of non-aesthetic concepts. Isabel Hungerland (1968) has described a distinction that she believes marks non-aesthetic concepts from aesthetic concepts: a seeming/being distinction. One can say that a person looks (seems) healthy but is not healthy, or that a house looks pink but is not pink. But this difference is absent in aesthetic attributions, she believes. If a vase looks gracefully curved, it is gracefully curved; if a voice sounds sweet, it is sweet.

Peter Kivy has objected to this way of distinguishing aesthetic from non-aesthetic concepts (1968). 'Unified', he argues, is surely an aesthetic concept; but it fails Hungerland's seeming/being test. A symphony may seem unified but may not really be unified. Kivy is also sceptical that there are no aesthetic concepts that can be reduced to non-aesthetic concepts. A very full description of a piece of music in non-aesthetic terms may lead one to conclude that the piece is unified. Thus there does not seem to be, for Kivy and others, a definitive way to distinguish aesthetic from non-aesthetic concepts.

3 Recent attempts to establish aesthetic realism

The view that there are no aesthetic laws connecting aesthetic and non-aesthetic concepts remains prevalent. Mary Mothersill, for example, argues that there are no principles or laws of taste and that everyone admits this when pressed (1984). None the less, aesthetic judgments are genuine judgments, that is, they have truth values and play a role in inference. They are open to serious question and debate (unlike, say, judgments about whether raw oysters taste good). They can be confirmed or disconfirmed by pointing to features of an object or event that are believed to cause pleasure, not just in the individual making the judgment but in other individuals who similarly investigate the object or event. Discussions that include aesthetic concepts are undertaken with the same hope of eventual agreement among persons of normal intelligence and interest as are discussions about many non-aesthetic concepts. There may be no reason to expect, as Kant believed, that everyone ought to find the same things beautiful; none the less we do expect that when we point to features or objects or events that we find beautiful, at least like-minded individuals will concur, according to Mothersill.

Another way theorists have tried to establish aesthetic realism is by arguing that aesthetic concepts connect to objective features of the world via a relationship known as 'supervenience' (see Supervenience). Even if aesthetic concepts may not be definable in terms of non-aesthetic concepts, if one can establish that the properties associated with these aesthetic concepts supervene on physical properties that exist in the world, then there is a foundation for the objectivity of aesthetic judgments. Philosophers have characterized supervenience in various ways; however, the important feature they all try to capture is the connection between a stable set of base properties and some property that seems to depend upon them, even though that dependence cannot be captured via a strict definition. It is possible to imagine two houses that share all base properties except that one house is yellow, the other not. 'Yellow' is not supervenient. But if both houses share all base properties then it is not possible for one to be beautiful, the other not beautiful. 'Beauty' is supervenient. As long as the base properties are stable and the meaning of 'beauty' remains the same, then it will be either true or false that anything with those base properties is beautiful. Thus a vase's graceful curves cannot be defined in terms of its angles, size, colour, material, and so forth, but its gracefulness does depend upon the particular physical properties that it possesses. If all the physical properties stay the same, so will all of its aesthetic properties, in this view. Thus aesthetic concepts are connected to the real world, and individual attributions of an aesthetic term can be explained or justified in terms of 'real world' properties.

But not everyone agrees that aesthetic concepts are illuminated via the notion of supervenience. For one thing, it is difficult to specify clearly what counts as a base property. Sibley, for example, thinks that colour is not an aesthetic property (for anyone with ordinary perceptive powers can see the colour of an object); others think that colour is obviously an aesthetic property. Furthermore, an essential assumption is that the meaning of 'beauty' be stable - and this is an assumption that has been seriously questioned. A building considered beautiful in one culture may not be considered beautiful elsewhere. Thus it appears that beauty is not supervenient, for it is possible for two houses to have all the same properties except that one is beautiful, the other not beautiful.

4 Aesthetic concepts as contextual constructs

If taste or some similar universal human propensity to have certain sorts of experiences in the presence of some objects or events is the foundation of aesthetic concepts, then one would expect that all people (at least all who share a certain degree of sensitivity) will form similar concepts. Beauty and ugliness, for example, should be concepts formed and sustained by persons across time and space. Just as colour concepts or concepts of heat and cold exist across cultures because human beings are physically and mentally constructed to experience variations in colour and temperature, so aesthetic concepts should exhibit cross-cultural similarity if we are physically and mentally constructed so as to experience variations, say, in proportion or rhythm.

Recently, however, a growing number of theorists have discussed ways in which aesthetic concepts may be socially constructed. The widely shared common-sense attitude that there is no fact of the matter with respect to aesthetic judgments (some people like opera, some rock music), and the relativism that often accompanies this attitude are more systematically articulated in aesthetic theories that ground aesthetic concepts in contextual features of the circumstances in which they arise.

Not only do people from different communities disagree about what is beautiful, moving or harmonious, communities do not universally share the same aesthetic concepts at all. In Japanese poetry, for example, *makoto* is a very important concern. No direct English translation of the word, however, is possible. At best one can give a rough gloss: sincere or genuine expression of an appropriate emotion. The word is most commonly used in discussions about haiku - a poetic form that also lacks a direct equivalent in English literature. We lack the word and hence the concept. R.G. Collingwood warned that we cannot describe African art in English without making it seem like English art and vice versa. Some ethnomusicologists observe that even as basic a concept as rhythm does not travel from Europe to Africa without significant alteration. One’s concepts are determined by the language that one speaks - and this language is shaped and determined by interests and attitudes that are culturally specific.

If aesthetic concepts are culturally determined, then understanding any particular concept will demand fluency in the culture in which it is operative. This is exactly what several contemporary theorists urge. Many feminists theoreticians, for example, criticize aestheticians like Kant and Sibley for assuming that they could speak with a ‘universal voice’. If Kant did not see a relation between moral and aesthetic concepts, it does not follow that they are separate in the experiences of all human beings. One’s gender, class, religion, economic or political status do often affect the way one forms and applies aesthetic concepts, they insist. If a person does not see what Frank Sibley sees, Sibley is not necessarily a more sensitive person.

Aesthetic concepts are learned in contexts where roles of performer, creator, audience, critic, tourist, and so forth are learned. These roles are culture-bound; indeed, some of them do not even exist in some communities. Some aesthetic responses may seem ‘natural’ (for example, all people seem to like watching sunsets), but many are the consequence of social prescription and proscription. Often sharing non-aesthetic values is a prerequisite of sharing aesthetic values, and hence of sharing aesthetic concepts.

Aesthetics

Aesthetics owes its name to Alexander Baumgarten who derived it from the Greek *aisthanomai*, which means perception by means of the senses (see Baumgarten, A.G.). As the subject is now understood, it consists of two parts: the philosophy of art, and the philosophy of the aesthetic experience and character of objects or phenomena that are not art. Non-art items include both artefacts that possess aspects susceptible of aesthetic appreciation, and phenomena that lack any traces of human design in virtue of being products of nature, not humanity. How are the two sides of the subject related: is one part of aesthetics more fundamental than the other? There are two obvious possibilities. The first is that the philosophy of art is basic, since the aesthetic appreciation of anything that is not art is the appreciation of it as if it were art. The second is that there is a unitary notion of the aesthetic that applies to both art and non-art; this notion defines the idea of aesthetic appreciation as disinterested delight in the immediately perceptible properties of an object for their own sake; and artistic appreciation is just aesthetic appreciation of works of art. But neither of these possibilities is plausible.

The first represents the aesthetic appreciation of nature as essentially informed by ideas intrinsic to the appreciation of art, such as style, reference and the expression of psychological states. But in order for that curious feeling, the experience of the sublime - invoked, perhaps, by the immensity of the universe as disclosed by the magnitude of stars visible in the night sky (see Sublime, the) - to be aesthetic, or for you to delight in the beauty of a flower, it is unnecessary for you to imagine these natural objects as being works of art. In fact, your appreciation of them is determined by their lack of features specific to works of art and perhaps also by their possession of features available only to aspects of nature (see Nature, aesthetic appreciation of).

The second fails to do justice to the significance for artistic appreciation of various features of works of art that are not immediately perceptible, such as a work's provenance (see Artistic forgery) and its position in the artist's oeuvre. A more accurate view represents the two parts of the subject as being related to each other in a looser fashion than either of these positions recognizes, each part exhibiting variety in itself, the two being united by a number of common issues or counterpart problems, but nevertheless manifesting considerable differences in virtue of the topics that are specific to them. In fact, although some issues are common to the two parts, many are specific to the philosophy of art and a few specific to the aesthetics of non-art objects.

Both works of art and other objects can possess specifically aesthetic properties, such as beauty and gracefulness. If they do possess properties of this sort, they will also possess properties that are not specifically aesthetic, such as size and shape. And they will be susceptible of aesthetic and non-aesthetic appreciation, and subject to aesthetic and non-aesthetic judgments. What distinguishes an item's aesthetic from its non-aesthetic properties and what faculties are essential to detecting aesthetic properties (see Aesthetic concepts)? What is the nature of aesthetic appreciation? It has often been thought that there is a particular attitude that is distinctive of aesthetic appreciation: you must adopt this attitude in order for the item's aesthetic properties to be manifest to you, and if you are in this attitude you are in a state of aesthetic contemplation (see Aesthetic attitude). This suppositious attitude has often been thought of as one of disinterested contemplation focused on an item's intrinsic, non-relational, immediately perceptible properties. But perhaps this view of aesthetic interest as disinterested attention is the product of masculine bias, involving the assumption of a position of power over the observed object, a reflection of masculine privilege, an expression of the 'male gaze' (see Feminist aesthetics §3). Another idea is that awareness of an object's aesthetic properties is the product of a particular species of perception, an idea which stands in opposition to the claim that this awareness is nothing but the projection of the observer's response onto the object (see Artistic taste).

An object's beauty would appear to be a relational, mind-dependent property - a property it possesses in virtue of its capacity to affect observers in a certain manner. But which observers and what manner? And can attributions of beauty, which often aspire to universal interpersonal validity, ever attain that status (see Beauty)? The great German philosopher Immanuel Kant presented a conception of an aesthetic judgment as a judgment that must be founded on a feeling of pleasure or displeasure; he insisted that a pure aesthetic judgment about an object is one that is unaffected by any concepts under which the object might be seen; and he tried to show that the implicit claim of such a judgment to be valid for everyone is justified. But how acceptable is his conception of an aesthetic judgment and how successful is his attempted justification of the claims of pure aesthetic judgments (see Kant, I.

§12)?

1 Aesthetics of art

Those questions that are specific to the philosophy of art are of three kinds: ones that arise only within a particular art form or set of related arts (perhaps arts addressed to the same sense), ones that arise across a number of arts of heterogeneous natures, and ones that are entirely general, necessarily applying to anything falling under the mantle of art.

Here are some of the most salient facts about art. Not everything is art. Artists create works of art, which reflect the skills, knowledge and personalities of their makers, and succeed or fail in realizing their aims. Works of art can be interpreted in different ways, understood, misunderstood or baffle the mind, subjected to analysis, and praised or criticized. Although there are many kinds of value that works of art may possess, their distinctive value is their value as art. The character of a work of art endows it with a greater or lesser degree of this distinctive value.

Accordingly, the most fundamental general question about art would seem to be: what is art? Is it possible to distinguish art from non-art by means of an account that it is definitive of the nature of art, or are the arts too loosely related to one another for them to possess an essence that can be captured in a definition (see Art, definition of)? Whatever the answer to this question may be, another entirely general issue follows hard on its heels. It concerns the ontology of art, the kind of thing a work of art is. Do some works of art fall into one ontological category (particulars) and some into another (types) or do they all fall within the same category (see Art works, ontology of)? And a number of other important general questions quickly arise. What is a work's artistic value and which aspects of a work are relevant to or determine this value? Is the value of a work of art, considered as art, an intrinsic or an extrinsic feature of it? Is it determined solely by the work's form or by certain aspects of its content - its truth or its moral sensitivity, for example? Can judgments about a work's artistic value justifiably lay claim to universal agreement or are they merely expressions of subjective preferences? And how is a work's artistic value related to, and how important is it in comparison with, other kinds of value it may possess (see Art, value of; Formalism in art; Art and truth; Art and morality; Schiller, J.C.F.)? What is required to detect the critically relevant properties of artworks, over and above normal perceptual and intellectual powers, and how can judgments that attribute such properties be supported (see Art criticism)? What kinds of understanding are involved in artistic appreciation, and must an acceptable interpretation of a work be compatible with any other acceptable interpretation (see Art, understanding of; Artistic interpretation; Structuralism in literary theory)? In what way, if any, does the artist's intention determine the meaning or their work (see Artist's intention)? What is an artist's style and what is its significance in the appreciation of the artist's work (see Artistic style)?

2 Aesthetics and the arts

One question that arises only for a small set of art forms concerns the nature of depiction. It might be thought that the analysis of the nature of depiction has no special importance within the philosophy of art, for pictorial representation is just as frequent outside as inside art. But this overlooks the fact that real clarity about the ways in which pictures can acquire value as art must be founded on a sophisticated understanding of what a picture is and the psychological resources needed to grasp what it depicts. So what is it for a surface to be or contain a picture of an object or state of affairs? Must the design on the surface be such as to elicit a certain species of visual experience, and must the function of the means by which the pattern was produced, or the intention of the person who created it, be to replicate features of the visible world? Or is a picture a member of a distinctive kind of symbol system, which can be defined without making use of any specifically visual concepts (see Depiction; Goodman, N. §2)? Another question that has a limited application concerns the distinctive nature and value of a particular artistic genre, the response it encourages from us, and the insight into human life it displays and imparts. For example, whereas a comedy exploits our capacity to find something funny, a tragedy engages our capacity to be moved by the fate of other individuals, and erotic art aims to evoke a sexual reaction; and this difference in the emotional responses at the hearts of the genres goes hand in hand with the different aspects of human life they illuminate (see Comedy; Emotion in response to art; Erotic art; Humour; Tragedy).

Questions about the individual natures and possibilities of the various arts include some that are specific to the particular art and some that apply also to other arts. On the one hand, relatively few art forms (architecture and pottery, for example) are directed to the production of works that are intended to perform non-artistic functions, or

are of a kind standardly used for utilitarian purposes, and, accordingly, the issue of the relevance to its artistic value of a work's performing, or presenting the appearance of performing, its intended non-artistic function satisfactorily is confined to such arts (see Architecture, aesthetics of). Again, only in some arts does a spectator witness a performance of a work, so that issues about a performer's contribution to the interpretation of a work or about the evaluation of different performances of the same work are limited to such arts (see Art, performing). And since only some works of art (novels, plays and films, for example) tell a story, and only some refer to fictional persons or events, questions about the means by which a story is told or how references to fictional objects should be understood have a restricted application within the arts (see Narrative; Fictional entities). On the other hand, most, if not all, arts allow of works within their domain being correctly perceived as being expressive of psychological states, and, accordingly, give rise to the question of what it is for a work to be expressive of such a condition (see Artistic expression). But the means available within the different arts for the expression of psychological states are various: poetry consists of words, dance exploits the human body, and instrumental music uses nothing other than sounds. And these different artistic media impose different limits on the kinds of state that can be expressed by works of art, the specificity of the states, and the significance within an art of the expressive aspects of its products (see Gurney, E. §2). Furthermore, it is a general truth about the various arts, rather than one special to expression, that what can be achieved within an art is determined by the nature of the medium the art is based on. Accordingly, an adequate philosophy of art must investigate the variety of such media and elucidate the peculiar advantages they offer and the limitations they impose (see Abstract art; Dance, aesthetics of; Film, aesthetics of; Hanslick, E.; Langer, S.K.K>; Lessing, G.E. §2; Music, aesthetics of; Opera, aesthetics of; Photography, aesthetics of; Poetry).

Aesthetics and ethics

The contrast between ethical and aesthetic judgments, which has provided a good deal of the subject-matter of aesthetics, stems largely from Immanuel Kant's idiosyncratic view of morality as a series of imperatives issued in accordance with the dictates of practical reason, while for him judgments of taste are based on no principles. This has led even non-Kantians to argue that aesthetic judgments are primarily concerned, as is art itself, with uniqueness, while morality has mainly to do with repeatable actions. This tends to separate art from other human activities, a separation which was encouraged by the collection of useless items by 'connoisseurs', who took over as their vocabulary of appreciation the traditional language of religious contemplation. This viewpoint has been attacked passionately by idealist aestheticians, who claim that art is a heightening of the common human activity of expressing emotions, to the point where they are experienced and rendered lucidly, as they rarely are in everyday life. Marxist aestheticians, whose roots lie in the same tradition as idealists, argue that art is inherently political, and that the realm of 'pure aesthetic experience' is chimerical. Meanwhile the analytic tradition in aesthetics has spent much effort amplifying Kant-style positions, without taking into account their historical conditioning. There is a tendency to contrast the activities of the moralist, prescribing courses of action, with that of the critic, whose only job can be to point to the unrepeatable features which constitute a work of art.

1 Origins of the discussion

Ethics is the study of what people ought to do and the concepts employed in giving an account of why they should behave in certain ways; this study includes consideration of such factors as the nature of the judgments made about people's actions (are they objective or subjective?). Aesthetics is the study of a certain way of responding to nature and to some artefacts, pre-eminently works of art, and an investigation of the status of the judgments we make about them. At least, that is roughly how the subjects have been conceived traditionally. It is impossible to give a noncontroversial definition of either of them. That has consequences for the comparisons and contrasts between them which have been a feature of, at least, aesthetic discussion since Kant (see Kant, I. §12). He was the first great philosopher who gave extended and elaborate treatment to the nature of aesthetic judgment, though unfortunately that was as part of his attempt to overcome crippling difficulties in the rest of his system. Despite that, he largely set the agenda for subsequent discussion of aesthetic judgment, both its form and its content.

Though he did not place his thoughts on the subject in a historical context, it aids understanding if we do. Kant was writing in an intellectual climate in which natural science was increasingly taken to be the paradigm of human knowledge, with its picture of a wholly causally determined order (see Determinism and indeterminism §1). Kant accepted that account of the world of appearances (nature as we normally conceive it, including human nature), but argued that if we are to be moral agents we must be free in some strong (metaphysical) sense. For Kant, to be free is to be subject to a set of universal laws different to the descriptive laws of nature, namely those of practical reason, which are prescriptive. So as inhabitants of the phenomenal world we are intelligible according to the laws which govern everything else in it. As inhabitants of the noumenal world (the world of things-in-themselves) we are answerable to the moral law, alongside all other rational beings (see Kantian ethics).

This oppressively well-regulated view of things, in which both as objects and as agents we are to be regarded simply as law-governed items, not only has its own difficulties in reconciling the two kinds of being, but also leaves no room for taking an interest in something without seeing it as a member of a class (see Universalism in ethics §3). It is at this point that the aesthetic makes its debut, as a kind of interest in certain things, expressed in a kind of judgment, which is concerned with those things quite apart from any use to which they may be put, or even, Kant says, independently of whether they actually exist: an interest which is without, in the appropriate sense, interest.

2 Development of a contrast

It might be felt that, given the importance which Kant attached to the contrast between an aesthetic and any other kind of interest in things, it is surprising that it had not been made before. In fact it had, but in a different context, as we shall see. Furthermore, a set of pressures of a kind quite remote from anything Kant had in mind made such a contrast not only intelligible but urgent. With the growth of a merchant class intent on displaying its wealth, the purchase of useless objects which could be collected and displayed in private exhibitions became a major form of

consumption. Taste, in a new and extended sense, was necessary to make fine discriminations between superior and inferior specimens of the same kind of thing, where what made the crucial difference between good and bad became ever more recondite, requiring the activity of people called ‘virtuosi’ or, in subsequent gallicized form, ‘connoisseurs’. They employed a fairly rich evaluative vocabulary, but the justification for its use was to be found not in general rules, but in the possession by individual things of certain perceptual properties, properties discerned through taste. Thus on account of the colours which constitute them, and the balances between those colours, one judges whether paintings are unified, harmonious, and so on. The proper judgment of taste, as Kant was to put it, is always singular: ‘This is beautiful’.

The peculiar set of forces which drove Kant’s system, especially by the time he came to deal with beauty in the *Critik der Urteilskraft (Critique of Judgment)* (1790), can be ignored. Despite them he managed to exert a huge influence on the young subject of aesthetics, and to establish a contrast or set of contrasts with ethics which is still going strong, though there have been many opposing voices. As much as the welcome stress on the particular which aesthetic contemplation was alleged to certify, there was a vocabulary at hand which had seemed in danger of losing its employment: the vocabulary of theology, or rather that part of it which was concerned to stress the unique value of the object of devotion. Hence the striking similarity between the traditional terminology of worship and the new one of aesthetic absorption. It is no coincidence that for the first time we come across the phrase ‘the religion of art’. The phenomenon itself would have been inconceivable at an earlier date.

3 Aesthetics and history

Though philosophers are notoriously prone to self-consciousness about the nature of their subject, they have tended to regard the relationship between it and other disciplines in a less historically aware way than might have been expected. So the Kantian stress on the uniqueness of the aesthetic object has not often been subjected to historical scrutiny. This failure has resulted in a set of contrasts between the aesthetic and the ethical which have been taken as timeless truths about the two areas, rather than as the consequences of the triumphant progress of science and the decline of religion, among other factors. During the nineteenth century the conflicting, rather than complementary, tendencies to see art and aesthetic experience as *sui generis*, or as socially significant and morally and politically committed, simply confronted one another, strongly-worded manifestos appearing on each side, with little recognition of the elaborate background which had led to this polarization of attitudes.

The most striking contributions to aesthetics have, as a consequence, come from, on the one hand, idealist philosophers, such as R.G. Collingwood (1938), who have stressed the relationship between aesthetic and moral experience, and in general the connections between art and life, to the point where we are all seen as potential artists, though we rarely actualize our capacities (see Collingwood, R.G.; Art and morality §1). For a school of thinkers which lays great moral stress on self-realization, and sees the artistic enterprise as a matter of clarifying feelings, it is not surprising that morality finally comes to be seen as an art, if not as art (see Self-realization). On the other hand, major statements of a quite different hue have come from Marxist-oriented philosophers, above all some members of the Frankfurt School, such as Theodor Adorno, who have been at pains to point out both ‘the ideology of the aesthetic’, that is, the extent to which insisting that aesthetic experience is unrelated to other kinds is itself a political statement, and the general pervasiveness of politics, so that a major function of aesthetic theory is to bring to light the hidden ethical and political allegiances of varying aesthetic stances (see Frankfurt School).

Both these opposing schools derive in large measure from the inspiration of Hegel (§8); that is not surprising, given the stress in his own writings on aesthetics on the primacy of art rather than nature, the historical dimensions of artistic production and understanding, and the different functions which art serves in different societies, or the same society at different stages.

4 Aesthetics and ethics in analytic philosophy

The least rewarding incursions into aesthetic theory and its relationship to ethics have been by Anglo-American philosophers of the last forty years. They have tended to produce, no doubt unwittingly, parodies of Kantianism, in which the contrast between our responses to art and our moral judgments is rendered so extreme that it has been alleged by, for example, Hampshire (1952) and Strawson (1966) that the uniqueness of art-objects is such as to render them ineffable. These philosophers are so filled with abhorrence at the idea of using works of art for any purpose at all that they claim that their glory is their purposelessness, except perhaps for their unique rendering of

uniqueness. On this view, morality assimilates, art differentiates. Whereas the moralist has to recommend and to judge, the critic has only to point out the specific features of objects under contemplation. Aesthetics has as a large part of its point the indication of its own limited range: mainly to stress that it is not, at any crucial juncture, comparable to ethics. Unfortunately the tendency of this tradition of aesthetics to refrain from giving examples means that the reader is likely, when encountering a reference to ‘moral actions’, to think of keeping a promise, or something equally banal; whereas when the reference is to ‘a work of art’ the natural tendency will be to think of the Sistine Chapel ceiling, or a Shakespeare play. Hence it is not surprising that morality and art, ethics and aesthetics, are thought to be sharply divergent, and that the critic’s role is taken to be utterly dissimilar to the moralist’s.

Analytic aesthetics has been written almost exclusively from the spectator’s viewpoint. The same may be true of Hegel, but it did not influence the way he saw the subject as it has done recent aesthetics. For most of its history, writing in general terms about art (though it was not then called ‘aesthetics’) in fact consisted of discussions of the rules which, if not sufficient for the production of great art, were thought to be certainly necessary. Equally, a large amount of moralizing did not take the form of giving rules, but of holding up examples of the good life, of preaching ways of being rather than doing. In such a different climate of thought, the comparisons and contrasts to be drawn between the disciplines of aesthetics and ethics would be startlingly unlike those we have grown familiar with in recent thinking.

Aesthetics in Islamic philosophy

The major Islamic philosophers produced no works dedicated to aesthetics, although their writings do address issues that contemporary philosophers might study under that heading. The nature of beauty was addressed by Islamic philosophers in the course of discussions about God and his attributes in relation to his creation, under the inspiration of Neoplatonic sources such as the pseudo-Aristotelian Theology of Aristotle*, a compilation based upon the* Enneads *of Plotinus. Considerations of artistic beauty and creativity were also addressed in works inspired by Aristotle's* Rhetoric *and* Poetics*, and Islamic philosophers also adapted some of Plato's views on literature and imitation, particularly those expressed in the* Republic.

On the whole, Islamic philosophers did not view artistic and literary creativity as ends in themselves. Rather, their interest was in explaining the relations of these activities to purely intellectual ends. In the case of poetics and rhetoric in particular, the emphasis in Islamic philosophy was pragmatic and political: poetics and rhetoric were viewed as instruments for communicating the demonstrated truths of philosophy to the populace, whose intellectual abilities were presumed to be limited. The medium of such communication was usually, although not necessarily, that of religious discourse. Islamic philosophers also devoted considerable attention to explaining the psychological and cognitive foundations of aesthetic judgment and artistic production within the spectrum of human knowledge. They argued that rhetoric and poetics were in some important respects non-intellectual arts, and that poetics in particular was distinctive in so far as it addressed the imaginative faculties of its audience rather than their intellects.

1 Beauty

Plotinus' *Ennead* V.8, 'On Intelligible Beauty', was the basis for the fourth chapter of the Arabic compilation known as the *Theology of Aristotle* (see Plotinus §§1, 7). Against the background of the discussion of beauty in this text, Islamic philosophers developed the theme of the differences between sensible and intelligible beauty; and the love and pleasure associated with each.

The notion of intelligible beauty is included in the discussion of the names and attributes of God contained in al-Farabi's *al-Madina al-fadila (The Virtuous City)* (see al-Farabi §2). Among the divine names al-Farabi lists 'beauty' (*al-jamal*), 'brilliance' (*al-baha'*), and 'splendour' (*al-zina*). Although the connotations of these terms are principally visual and hence sensible, al-Farabi argues that beauty in all things is primarily ontological: the more any being attains its final perfection, the more beautiful it is. From this he reasons that God, whose existence is most excellent, is the most beautiful of beings. Moreover, God's beauty surpasses all other beauty because it is essential, not accidental: the source of God's beauty is his own substance as defined by his self-contemplation, whereas created beauty derives from accidental and corporeal qualities that are not one with their own substances. Finally, al-Farabi argues that pleasure and beauty are intimately related, and that consequently God's pleasure, like his beauty, is beyond our comprehension. Pleasure is attendant upon the perception or apprehension (*idrak*) of beauty, and it increases in proportion to the beauty of what is perceived. Since God is the most beautiful of beings, and since his proper activity consists in an act of self-contemplation in which knower and known are completely one, the intensity and certitude of God's perception of his own beauty, al-Farabi reasons, must yield a pleasure of equal intensity. Moreover, since God's perception of his own beauty is the function of an eternal and uninterrupted act of contemplation, his pleasure, unlike ours, is continual rather than intermittent.

While al-Farabi's treatment of beauty in this context is principally an extension of his general account of divine transcendence and perfection along standard Neoplatonic lines, the development of the connection between beauty, perception and pleasure introduces a more properly aesthetic element into his account. Beauty in God, like beauty in the sublunar world, is found principally in things in so far as they achieve their proper perfection; when that beauty, be it sensible or intelligible, becomes an object of contemplation, it becomes in turn a source of pleasure for the one beholding it.

The contrast between sensible and intelligible beauty and the affective pleasures proper to each is developed in more detail in the *Risala fi al-'ishq (Treatise on Love)* by Ibn Sina. In the fifth chapter of this work, Ibn Sina discusses the youthful love of external, bodily beauty. He opens his discussion of the love of beauty with a consideration of four principles, three of which pertain to the psychology of the human soul. The first is based

upon Ibn Sina's characteristic view of the soul as a single substantial unity comprising a hierarchy of distinct powers. Either these powers can work together in harmony, in which case the lower will be ennobled by their cooperation with the highest faculty, that of reason, or the lower powers can rebel. These two possibilities are especially evident in the relations between reason and imagination (*al-takhayyul*) and the desires attendant upon them. The second principle is an elaboration upon the first: there are some human actions which pertain only to the bodily, 'animal' faculties within this hierarchy, including sensation, imagination, sexual intercourse, desire and aggression. Either these actions can be pursued in a purely animal fashion, or they can be transformed into something uniquely human under the guidance of reason.

Ibn Sina's third principle is that everything ordained by God has its own proper goodness and hence is the object of some legitimate desire; nonetheless, the lower desires can interfere with the higher, and thus their unlimited pursuit is to be avoided. Finally, Ibn Sina's fourth principle presents his definition of beauty in so far as it is the object of love for both the rational and animal souls: beauty (*al-husn*) consists in order (*al-nazm*), composition, (*al-ta'lif*) and symmetry (*al-i'tidal*). In the animal soul, this love of beauty is purely natural, arising either from instinct or from the simple pleasure of sensible perceptions. In the rational soul, however, love of beauty is more reflective, ultimately resting upon the recognition of the proximity of the beloved object to God, the First Beloved.

In applying these principles, Ibn Sina argues that there is what we might call an innate aesthetic sense implanted in every intellectual being (*al-'aqil*) which kindles in it a passionate desire for what is beautiful to behold (*al-manzar al-husn*). Despite the overall orientation of his discussion to the desire for the supra-sensible and purely intelligible beauty of God, Ibn Sina's remark here clearly pertains to the realm of sensible judgments. In fact, Ibn Sina even argues that such a desire for sensible beauty on the part of an intellectual being can be a noble thing, so long as the purely animal aspects of the desire are subordinated and the intelligible allowed to influence the sensible: such a purified aesthetic desire, according to Ibn Sina, results in a partnership (*al-shirka*) between the animal and rational souls. As evidence of this more general claim, Ibn Sina notes that even the most wise of humans can be preoccupied by a 'beautiful human form', and he implies that such a preoccupation is justified not only by the intrinsic aesthetic principles he has outlined, but also on the assumption that internal and external beauty and harmony mirror one another, unless the external beauty has been accidentally harmed or the internal character has been altered (for better or worse) by habituation. Finally, Ibn Sina also defends the desire for some sort of physical union with such a beloved, through kissing and caressing, although the expression of such an aesthetic impulse through sexual union is considered inappropriate except for the purpose of procreation, and where sanctioned by religious law.

2 Rhetoric and poetics

Most discussions of aesthetic themes by Islamic philosophers occur in the context of their considerations of the arts or rhetoric and poetics and the Aristotelian treatises devoted to these topics (see Aristotle §29). Following a practice established by the sixth-century Greek commentators on Aristotle, these treatises were classified by the Islamic philosophers as parts of Aristotle's logical corpus, the Organon (see Aristotelianism in Islamic philosophy). Thus the approach to these arts was not primarily aesthetic, but was focused on linguistic issues and the cognitive functions of rhetorical and poetic language. Rhetoric and poetics were classified as popular methods of instruction which produced less than certain states of belief in their audiences, who were assumed to be incapable of grasping the finer points of truly philosophical demonstration.

The Islamic philosophers did not explicitly limit the use of rhetoric and poetics to the spheres of religious discourse and political communication, however, and in their commentaries on Aristotle's *Poetics* some effort was spent on explaining the linguistic mechanisms whereby speech becomes figurative and metaphorical. Ibn Rushd in particular attempted to apply his understanding of Aristotle's views on poetics to the interpretation and criticism of Arabic poetry, and his *Talkhis kitab al-shi'r (Middle Commentary on the Poetics)* is full of citations of the works of well-known Arabic poets. Nonetheless, most of the interest taken by the Islamic philosophers in the arts of rhetoric and poetics stemmed from the foundations provided by these arts for explaining the relationship between philosophy and religion. The central books of al-Farabi's *Kitab al-huruf (The Book of Letters)*, along with Ibn Rushd's *Fasl al-maqal (Decisive Treatise)*, are devoted to this theme, which is nicely summed up in the following passage from al-Farabi:

> And since religion only teaches theoretical things by evoking imaginings and by persuasion, and its followers

> are acquainted with these two modes of instruction alone, it is clear that the art of theology which follows religion is not aware of anything that is not persuasive, and it does not verify anything at all except by persuasive methods and statements.
>
> (*Kitab al-huruf*: 132)

The use of the language of 'imaginings' and 'persuasions' indicates a reference to the cognitive aims that the Islamic philosophers traditionally ascribed to the arts of rhetoric and poetics. Religion is a reflection of and handmaiden to philosophy, dependent upon philosophy as a copy is dependent upon its original. In understanding religion as an imitation of philosophy, the Islamic philosophers were consciously evoking the background of Aristotle's *Poetics* and Plato's *Republic* and the aesthetic theories which they developed through a creative blending of the respective views of their two ancient sources on the nature of imitation.

3 Imitation and imagination

Ibn Sina's *Risala fi al-'ishq*, discussed in §1, contains elements of a theory of aesthetic judgment that is also developed, from a somewhat different perspective, in his discussions of the psychological underpinnings of the art of poetics. In these discussions, aesthetic judgments are attributed to the faculty of imagination (*al-mutakhayyila*) and the related internal sense faculties that formed a part of the Islamic Aristotelians' development of the concept of imagination (*phantasia*) found in Aristotle's *On the Soul* and *Parva naturalia*. In turn the notion of imitation or *mimēsis*, as found in Plato's *Republic* as well as in Aristotle's *Poetics*, was interpreted in terms of the functions of the imaginative faculty.

Al-Farabi, Ibn Sina and Ibn Rushd all identify the imagination as the faculty by which poets produce the figurative discourses proper to their art, and to which they appeal in their audience. These authors all contrast this use of and appeal to the imagination with the strictly intellectual and rational aim proper to all other modes of discourse and forms of reasoning. Al-Farabi's *Ihsa' al-'ulum (The Book of the Enumeration of the Sciences)* provides one of the most extensive descriptions of the character of poetic imagination. Two aspects of poetic statements are emphasized by al-Farabi: their representation of their subjects in terms 'more noble or more debased' than they actually are, and their ability to bring about an appetitive, as well as a cognitive, movement in the audience. That is, by depicting a subject in terms of images that evoke a loathsome object, the poet is able to make the hearers feel aversion to the thing depicted, 'even if we are certain that it is not in fact as we imagine it to be' (*Ihsa' al-'ulum*: 84). The reason for this aversion is directly linked to the poet's appeal to the imaginative faculty: 'for the actions of a human being frequently follow his imagination, more than they follow his opinion and his knowledge, because often his opinion or his knowledge are contrary to his imagination, whereas his doing of something is proportional to his imagining of it, and not to his knowledge or his opinion about it' (*Ihsa' al-'ulum*: 85).

A similar point is made by Ibn Sina in a number of texts. Ibn Sina frequently contrasts poetics with other modes of discourse by distinguishing the poet's attempt to produce an act of imagination (*takhyil*) in the audience with the more intellectual goal of seeking to produce an act of assent (*tasdiq*) to the truth or falsity of some claim. Ibn Sina, like al-Farabi, emphasizes the fact that such acts of imagination may often be contrary to what we know or believe to be the case, and he has a favourite example to illustrate this point: if someone tells us that 'honey is vomited bile', we are likely to lose our appetite for the honey before us, even if we are quite certain that the metaphor is literally false. Ibn Sina also echoes al-Farabi's claim that this ability of the imagination to affect our action is owing to the close link between the imaginative faculty and the appetitive motions of the soul.

The emphasis upon the imagination's ability to intervene in the soul's intellectual assent appears to have been directly linked by the Islamic philosophers to the theme of imitation. Al-Farabi, for example, appears to have made this connection in his *Ihsa' al-'ulum*, since he concludes his remarks on the poetic statement's ability to influence behaviour with the observation that this is 'what happens when we see likenesses imitative of the thing, or things resembling something else'. By the same token, throughout his *Talkhis kitab al-shi'r*, Ibn Rushd consistently interprets the Arabic term for *mimēsis* (*muhaka*) as equivalent to *takhyil*, the evoking of an image. And in several passages, Ibn Sina contrasts imaginative utterances which 'imitate one thing by another' with imaginative utterances that happen to be literally true as well. Generally, then, for the Islamic philosophers 'imitation' appears to refer to those specific acts of imaginative representation in which the object is depicted in terms not proper to it, or more specifically, which portray it as better or worse than its actual state. In this way, imitation is linked not

only or even principally to Aristotelian *mimēsis*, but rather to Plato's notion of imitation as it relates to the theory of the Forms found in the *Republic* (see Mimēsis; Plato §14).

This emerges clearly from a discussion in a little treatise by al-Farabi known simply as the *Kitab al-shi'r (Book on Poetics)*. In this treatise, al-Farabi identifies imitation, along with metric composition, as constitutive of the very substance of poetry, with imitation the most crucial of the two elements. In order to explain the nature of poetic imitation, which occurs through language, al-Farabi draws heavily upon its similarities to imitation through action, for example, in the making of statues or in performative imitations. Here too imitation is said to have as its end to 'cause an imagining' of the imitated object, either directly or indirectly. The difference between direct and indirect imitation refers to the distance that separates the representation of the object from the reality itself, as illustrated in the example of a statue. For if an artist wished to imitate a person named Zayd:

> … he might make a statue which resembles him, and along with this make a mirror in which he sees the statue of Zayd. And it might be that we would not see the statue itself, but rather the form of his statue in the mirror. And then we would know him through what imitates an imitation of him, and thus be two degrees removed from him in reality.

(*Kitab al-shi'r*: 94-95)

The possibility of degrees of removal from the original is highly evocative of Plato's description of the possible states of removal from the Forms in the myth of the cave. Al-Farabi believes this possibility holds not only for artistic imitation, but also for linguistic imitation in poetry. While these associations are sometimes viewed pejoratively by the Islamic philosophers, as one might expect in the light of their Platonic resonances, this attitude is not universal. Al-Farabi himself reports noncommittally that many people consider the more remote imitation to be the more perfect and artistic, and here as in his other works he admits the power of imitative utterances for inciting humans to actions to which intellectual opinion or knowledge fail to move them.

It is Ibn Sina (§8), however, who goes furthest in eliminating the negative overtones of these descriptions of poetic speech. In all but his most youthful writings, Ibn Sina emphasizes that the poet's concern with the imagination requires that his work be judged on its own terms and not on the level of intellectual judgments. Strictly speaking, poetic imaginings are neither true nor false; but in so far as poetic statements may imply corresponding intelligible propositions, they may possess a truth-value incidentally and secondarily. For this reason, although many will remain literally false, this need not be universally the case:

> And in general poetic [syllogisms] are composed of premises which evoke images… be they true or false. Generally they are composed of premises to the extent that they possess a figure and a composition which the soul receives by means of what is in them of imitation and even of truth; for nothing prevents this [that is, their being true].

(*al-Isharat wa-'l-tanbihat*: 80-1)

By the same token, Ibn Sina also allows for the use of poetic and imaginative discourse that is ethically neutral, seeking neither to ennoble nor to debase what is imitated, but rather merely aiming to 'provoke wonder through the beauty of the comparison' and thus to fulfil what could be termed a purely aesthetic end.

Aesthetics, African

The study and analysis of African art and aesthetics have been dominated by Western culture. Initially the aesthetic sensitivities of African cultures were characterized as 'primitive' and of low intellectual calibre. Africans reacted to such negative stereotyping by articulating their own, deliberately non-Western aesthetic theories. The best known of these is négritude.

With its emphasis on learning about a culture by living in it for a period of time, anthropology encouraged scholars to relate African art directly to the aesthetic values of the cultures that produced it. This kind of contextual approach has also become the special concern of African art historians.

One can exemplify the exploration of the aesthetic conceptions of a particular culture in this way by considering the case of the Yoruba peoples of southwestern Nigeria. The Yoruba have a detailed and refined aesthetic vocabulary that has been subjected to extended description and analysis. Where human beings are concerned the highest form of beauty is attributed to a person's good moral character. Where objects are concerned beauty is influenced by their utility or, in the case of figurative carvings, by the intelligence and ability of the artist.

1 Primitive cultures and *négritude*

The history of Western art and aesthetics might have been different if the founding fathers of these disciplines had been natives of a non-Western culture. The artistic genres and aesthetic standards imputed to Western culture by these experts might have been spurned as mistaken, alien, or pejorative. They might be said to have been prime examples of an ethnocentrism which imposes the aesthetic standards of one culture upon others. They might have succeeded in crossing cultures in order to identify some Western aesthetic sensitivities, about which they may have voiced some derogatory remarks and attributed their origins to something like a 'primitive' or 'child-like' mentality.

Each of these possibilities evokes unpleasant memories of scholarly theses that were enunciated when African and Western cultures interacted over the issue of aesthetic sensitivities, in particular those said to inform the genres of artefact that Western art collectors and museums began to define as constituting African art. The bulk of material published in this field is the product of Western scholarship. This scholarship began by denying African intellectual capabilities the same level of aesthetic consciousness that was embraced by the West. African aesthetic sensitivities were said to be primal, inarticulate, collective and instinctive. Africans were thought to be emotional rather than intellectual. As a result the artefacts produced by their cultures were said to express and represent semiconscious hopes and fears about the vaguely understood forces that controlled tribal society and the natural world. 'Primitive' art was conceived of as the product of 'primitive' understanding.

Eventually this emotional and expressive, as opposed to rational and intellectual, characterization of African personality and culture was adapted and reformulated as a positive, lyrical and intellectually refined aesthetic by indigenous African scholars. Termed *négritude*, this school of thought whose most prominent exponent was the sometime president of Senegal Leopold Sédar Senghor, rebuked Western scholarship for failing to assign African aesthetic sensitivities separate but equal status *vis-à-vis* their Western equivalents. It also inspired a renewed sense of black artistic merit that led to a flowering of modern African art in such diverse fields as drama, poetry, fiction, fashion and dance. Theoretical elements of *négritude* have also been adopted by the cultural and intellectual movements identified with Afrocentrism (see African philosophy, Francophone §4).

Nevertheless, as far as the Western-engendered collection and study of African art was concerned, the predominant interest and emphasis remained with mainly figurative, carved sculpture produced prior to the European colonization of Africa during the nineteenth century. Such pieces were viewed as comparatively 'authentic'. However, this term became associated with exaggerated Western notions of the semibarbaric, isolated, expressive tribal cultures that worshipped them, made sacrifices to them and created them out of an imagination that had not distinguished the rational from the emotional, the scientific from the superstitious.

2 Anthropology and African art history

It was modern twentieth-century Western anthropology which renewed interest in the identification, study and

appreciation of the intellectual dimension to African aesthetic values. African art objects, whose aesthetic properties had previously been assessed in virtual ignorance of the specific cultures that produced them (as expressions of a generalized, primitivized mentality) began to be culturally recontextualized on the basis of tribal attributions. Even if African art and aesthetics were not anthropological priorities, the general emphasis upon reintegrating objects and beliefs with the social and cultural contexts that originally produced them eventually reignited interest in indigenous artistic traditions and aesthetic values. Such renewed interest was underscored by the importance of doing fieldwork in Africa.

One controversial issue that remained unresolved was the degree to which traditional Africans were capable of articulating whatever aesthetic values informed their cultures. The point was whether Africans themselves could be relied upon to articulate their aesthetic values or whether (usually foreign) anthropologists would have to intuit them on their behalf. Some scholars continued to argue that much of whatever constituted African culture remained at a preverbal level. Whatever aesthetic standards there were implicit in inherited traditions and traditions governed cultures as rules rather than as reasons. Discussion and innovation were not priorities. The forms of figurative sculpture and patterns of textiles were inherited from a tribal past, replicated in the tribal present and passed on unaltered to the tribal future. In this intellectual atmosphere of elementary discursiveness there was no need to articulate or discuss fundamental aesthetic values. Aesthetic standards need not involve more complex considerations than how to polish an object, or colour a textile.

Increased interest in the social and cultural forces responsible for African art and in the aesthetic values that governed its creation has led to the emergence of a separate and specialized discipline known as African art history. In the process of disengaging itself from traditional anthropological interests and methods, this discipline has come to focus on the artistic and aesthetic in African cultures. Further social and cultural research has been encouraged to illuminate different African artistic and aesthetic elements. The scope of African art and aesthetics has been broadened beyond the objects found in private collections and museums so as to include architecture, bodily adornment and jewellery, as well as craftwork and oil and watercolour paintings. The technical aesthetic vocabulary and standards applied by Africans to the artistic elements of their cultures have been detailed. The peoples of Western cultures have been reminded that their aesthetic sensitivities and artistic preferences are products of Western acculturation and may therefore cause them to perceive the aesthetic in a different manner from individuals who are the product of an African culture. In addition, the level of cross-cultural critical appreciation of African art and aesthetics is in the process of being improved so that its technical, formal and intellectual properties may be better interrelated and appreciated. In this way African art history as subject matter can be accorded separate but equal status alongside the aesthetic traditions and heritages of other geographical and art historical groupings.

3 Yoruba moral discourse

To the philosopher of language the extent to which members of African cultures can articulate their aesthetic values is an important consideration. It seems an unnecessarily indirect and complicated strategy to arrive at the exegesis of any African aesthetic vocabulary by approaching it via the eclectic variety of objects that Western collectors and museums have made into African art. It would make better sense to begin the study of the aesthetic of any African culture with the terminology used by people of that culture. Such an approach may not provide information about whatever technical vocabulary might be employed by professional artists and critics in such a society. But it might be an essential foundational exercise preliminary to the identification and analysis of any more technical terminology.

The Yoruba of southwestern Nigeria have a subtle and systematic aesthetic vocabulary evidenced by ordinary discourse (see Yoruba epistemology). Yoruba aesthetic discourse is intimately related to Yoruba moral discourse. Moral discourse is grounded in epistemological, or cognitive, considerations as one of the fundamental issues is how a person can know the moral character, or *iwa*, of another. The Yoruba argue that since consciousness - *okon* - is private, behaviour - *isesi* - is the only basis on which the moral character of other people can be judged.

The Yoruba define behaviour by the actions, or *ise*, and words, or *oro enu*, of a person. In philosophical terminology this is conventionally referred to as nonverbal and verbal behaviour. Since the Yoruba equate knowledge, or *imo*, with what a person witnesses at first hand, there are severe strictures governing the attribution of either words or actions not experienced in this way.

Such strictures are predictable in an oral culture where literacy cannot be taken for granted. Their point seems to be as epistemic as it is moral. Just as people in Western cultures are concerned with exercising control over the media, members of Yoruba culture wish to exercise control over the mouths constituting the media in oral culture. False claims of knowledge of technical problems, or the moral character of people can endanger lives and destroy reputations.

4 Yoruba aesthetic discourse

Morality is linked with the aesthetic in everyday Yoruba discourse. This is because the Yoruba believe that the purest or highest form of beauty, or *ewa*, in humans is a good moral character, or *iwa rere*. They appreciate that in purely physical terms one person may be more attractive than others. As this is a matter of chance rather than choice, it is of superficial importance when it is a question of a person whose moral character can be relied upon in any situation. This means that a person who happens to be physically unattractive may still be deeply admired and praised for the beauty of their words and actions. Conversely a person of remarkable physical beauty may come to be regarded as viciously immoral on the basis of their words and actions. This preference for a beauty, or *ewa*, that is 'moral' or 'inner' is summed up by the Yoruba aphorism '*Iwa l'ewa*', meaning 'good moral character is beauty'.

Viewing Yoruba aesthetic discourse from this perspective reminds us that the Yoruba, like many other peoples, spend most of their time talking about 'beauty' with regard to humans rather than to the kinds of African art objects of special interest to collectors and museums. The Yoruba also attribute beauty to the natural world and to human artefacts, although different criteria are employed for measuring it.

With reference to the natural world a thing may be appreciated solely for its physical beauty, as might be the case with a glorious sunset. A natural object may be described as having both beauty (*ewa*) and character (*iwa*) if it is also useful to humankind in the sense of an attractive tree that also provides edible fruit, or a splendidly feathered chicken that also provides eggs and the main course for supper. In other words both beauty and character are most importantly assigned to natural objects by measuring their utility and usefulness to humankind.

With reference to human artefacts, the Yoruba may refer to a well-maintained agricultural farm, a new piece of furniture, or an attractive woven textile as possessing beauty. As with natural objects, the human artefacts may also be said to have character arising from their utility in the sense of a new chair that is comfortable and sturdy and the cloth that is durable as well as attractive.

Figurative sculptures, or carvings of human beings, also fall within the category of human artefacts. However, a sculpture of a human is not human. It cannot say or do and does not behave in any conventional human sense. This means that it cannot have moral character as this arises from verbal and nonverbal behaviour, or *isesi*. Yoruba appreciation of this is indicated by the fact that such objects are referred to as having exterior or bodily (*ara*) beauty (*ewa*). Such beauty takes into account factors such as form, polishing and colouring.

In recent years scholars have sought to identify the more specialized vocabulary by means of which professional artists and connoisseurs in Yoruba society articulate the formal principles and values that define and govern art work in the indigenous culture. The main aims are to elaborate whatever indigenous aesthetic consciousness may inform many of the objects the West has come to regard as African art, as well as to illuminate the many other decorative and performative practices, such as fashion, masquerade, poetry and song that are often of greater aesthetic importance and more enduring value to indigenous Yoruba culture. What is most striking about this more specialized vocabulary is the degree to which it replicates values affirmed by the epistemology and morality. Unlike Western culture, where the importance and relevance of aesthetic theory to artistic practice has declined, the relationship between the aesthetic and the artistic in Yoruba culture appears to be fundamental.

There is an emphasis upon the artist being calm, controlled and reasonable (*ifarabale*). The artist must also possess the aptitude for clear observation, understanding and expression (*iluti*). These essential foundational elements of the aesthetic consciousness must be intact in order to show sensitivity to the subjects portrayed and the audience reached. The Yoruba emphasize that the more narrow and conventional (at least in Western terms) 'artistic imaginative insight', or *oju inu*, which enables artists to 'picture' the forms they seek to instantiate, along with design components, or *oju ona*, such as colour, substance, rhythm, outline or harmony, can be exemplified in a superior manner only if based upon these foundational elements.

Previously published accounts of a Yoruba aesthetic by professional art historians do not present it as a single component belonging to an integrated system of epistemic, moral and aesthetic values. This may be attributed to a variety of influences, such as the vested interests of dealers and private collectors of African art whose focus is on the objects, the vestiges of the false stereotype that Africans are less capable of expressing themselves in rational and systematic terms, and the lack of attention paid by academic philosophers to semantic networks of meaning which underlie African discourse.

There is no obvious reason why the methodological approach illustrated by this account of a Yoruba aesthetic could not be applied to the discourse of other African cultures. Relatively few systematic studies of the values underlying, informing and interrelating epistemological, moral and aesthetic priorities and practices in African cultures have so far been undertaken. Even if their discourse embraces different epistemic standards and alternative moral virtues leading to other aesthetic values, the results could be of interest. In addition, such narratives would help to demonstrate that the museum objects which for many constitute African art may only occupy a minor and subsidiary role in the overall aesthetic that defines such cultures.

Aesthetics, Chinese

*In China, poetry, painting and calligraphy are traditionally known as the 'Three Perfections' of the cultivated scholar. They are construed as ethico-aesthetic acts of self-signification and are evaluated as to their efficacy in fostering harmonious relations of social exchange within the concrete circumstances of particular social contexts. In contrast to Western notions of mimesis, the Chinese poetic tradition assumes the existence of fundamental, mutually implicating correlations between the patterns (*wen*) immanent in nature and those of human culture.*

*This gives rise to two traditions of Chinese poetics. First, there is the canonical tradition of Confucian exegesis, in which a poem was assumed to invoke a network of pre-established categorical correlations (*lei*) between poet and world, which enabled the imagery to be read as verbal indices of both personal feeling and the relative stability of the social and natural order. Second, there is the non-canonical tradition of neo-Daoist and Buddhist-inspired poetics which represented a shift from the didactic to the affective power of natural imagery to make reference to the poet's state of mind.*

Calligraphy and painting were adopted by the gentleman-scholar as ethico-aesthetic practices of xiushen *(self-cultivation) and self-expression, and for promotion of social exchange. Early writings describing calligraphy and painting deploy metaphorical imagery that makes reference to both nature and the body. This imagery invoked the indigenous correlative rhetoric that sought consonance between the patterns immanent within the natural order and those of the human realm. The embodiment of tradition, through the practice of making artistic references to the past, was fundamental to the art of the scholar-painter, for it served to establish one's artistic lineage and to sanction or authorize one's own self-presentation within a particular historical situation.*

1 The ethico-aesthetic Way of Chinese art

In China, poetry, painting, and calligraphy are traditionally known as the 'Three Perfections' (*sanjue*) of the cultivated scholar. They were so designated because each of these modes of aesthetic practice came to serve as an important means of 'self-cultivation' (*xiushen*) as well as self-expression, and often appear combined in a single work of the scholar-artist.

According to tradition, poetry, painting and calligraphy originally stem from a common root-metaphor, namely *wen*. In the first Chinese etymological dictionary, Xu Shen's *Shuowen jiezi (Explanations of Simple and Compound Characters)*, *c.* AD 100, the character *wen* is said to consist of 'intersecting strokes, representing a criss-cross pattern'. *Wen* is a semantically multivalent term that can refer to physical markings, patterns on coloured woven silk and painted designs of carriages as well as writing, literature and culture. The aesthetic conception of *wen* is given by Liu Xi (early third century AD) in his lexicographic work *Shiming (Explanations of Names)*: 'Wen means assembling various colours to form brocade or embroidery, assembling words to form phrases and meanings like patterned embroidery' (Liu 1975: 101).

The Western word that comes closest in meaning to *wen* is *textus*, Latin for 'woven', from which the words 'text' and 'textile' are derived. However, *textus* does not connote the cosmological, and thus ethical, implications of *wen*. These can be traced back to the legendary accounts of the sage-king Bao Xi or Fu Xi, recorded in the *Dazhuan (Great Commentary)* to the early divination text, the *Yijing (Book of Changes)*. Contemplating the images (*xiang*) in the heavens above and the patterns (*wen*) on earth below, Bao Xi invented the *bagua* or eight trigrams, traditionally regarded as the prototypes of the Chinese scripts, the very foundation of Chinese civilization.

It is precisely through a patterning of human relations in correlation with the configurations immanent in natural phenomena that the ethical implications of *wen* are realized: 'Contemplate the configurations [*wen*] of heaven to observe the changes of seasons; contemplate the configurations of man to accomplish the [cultural] transformation of the world' (Liu 1975: 18-19). It is in light of this that we can appreciate the Chinese word for 'civilization', *wenhua*, which is literally 'transformation through patterning'.

2 Poetry

The earliest writings on Chinese poetry can be found in the *Daxue (Great Preface)* and commentaries to the first anthology of poetry, the *Shijing (Book of Songs)* in the sixth century BC, and commentaries to the *Lisao*

(Encountering Sorrow), the longest elegy in the *Chuci (Songs of Chu)* anthology, attributed to Qu Yuan (?343-278 BC). These commentaries, written by Confucian scholars of the Han dynasty (206 BC-AD 220), establish a way of construing poetry as an 'ethico-aesthetic practice' that dominated literary exegesis up until the Tang dynasty (618-906).

Chinese poetry does not take its start, as does Western poetry, from the act of positing the subject and object of cognition (that is, the objectification and independent, self-subsistent existence of self and world). In the dualistic thinking predominant in the West, the poetic representation of objective things and events is a mimetic, and hence fictive, representation of the non-subjective things and events in external reality (see Poetry). The Western conception of mimesis is essentially predicated on the dualistic notion of metaphor as 'identity in difference'. This binary logic has led to two fundamentally opposing positions concerning the image (*imago*), be it poetic or pictorial. Classical views of mimesis treat the image as an imitation (*imitatio*) of a pre-existing phenomenal world (see Mimēsis). Advocates of this position tend to embrace a 'perceptualist' theory of art. The romanticist, however, construes the image as the pure artifice (*inventio*) of the artist, representing, yet distinctly different from, the sensible world.

In contradistinction to the mimetic practices and subject-object duality of the West, the Chinese poetic tradition assumes the existence of fundamental, mutually implicating correlations between the patterns (*wen*) immanent in nature and those of human culture. The Chinese poem was thus understood to invoke a network of pre-established categorical correlations (*lei*) between poet and world, which receives systematic formulation in such thinkers as Dong Zhongshu, the leading Confucian of the Western Han period.

The correlation between poetic natural imagery and human situations is achieved through three master tropes: *fu* or descriptive 'exposition', *bi* or metonymic 'comparison', and *xing* or metaphoric substitution or 'stimulus'. What differentiates these poetic tropes from their Western rhetorical counterparts is that they were not construed as the invention of the individual poet. Rather, links between poetic imagery, be they metonymic juxtapositions (as in the *Shijing*) or metaphoric substitutions (as in the *Lisao*), were traditionally considered to draw upon shared affiliations in a priori categorical correlations (*lei*) antecedent to the poem. It is an expressive-affective conception of poetry that assumes an internal (emotion, *qing*) and external (nature, *jing*) correlation, based on relations of causality, which enable the imagery to be read as verbal indices of personal feeling and the stability of the political and cosmic order. It is a Confucian notion of poetry which fulfils a crucial function of moral, social and political critique.

Lyric poetry, according to *Lu Ji* (AD 261-303), 'originates in emotion' (*shi yuan qing*), a response of the poet to the stimulus of nature. This is made clear in his *Wen fu (Exposition on Literature)*:

> He moves with the four seasons, to sigh at transience,
>
> And looks at the myriad objects, contemplating their complexity.
>
> He laments the falling leaves during autumn's vigour,
>
> And delights in the tender branches of fragrant spring.

(*Wen fu*, in Yu 1987: 33)

Nature is thus conceived as the stimulus or semantic evocator and source of poetic imagery.

It is a stimulus/expression/affect conception of *poesis* in which natural images draw forth pre-established categorical correlations (*ganlei*) which stimulate (*ying*) or arouse (*qi*) in the heart-and-mind (*xin*) of the reader a morally didactic and emotionally affective response (*gan*). Then, through a process of contextualization, the poet's work is interpreted as a didactic response to the particular set of circumstances that occasion the poetic response. In this way, Chinese poetry is understood as ultimately addressing an actual historical condition in the world around the poet. This tradition persisted in later years in attempting to read poetry as a political commentary or moralistic purpose, referring, no matter how obliquely, to the life history of the poet.

With the collapse of the Han Confucian order, China entered into a period of political division and social instability that enabled neo-Daoism and eventually Buddhism to exert an influence on the intelligentsia in southern China. It was during this period that Chinese scholars turned away from the discredited affairs of the court and

engaged in practices of 'self-cultivation' and spontaneous acts called 'self-so-ing' (*ziran*) within natural settings (see Self-cultivation in Chinese philosophy). It is also at this time that we witness the rise of a tradition counter to that of the Confucian exegetes, beginning with the non-canonical landscape-poetry of Tao Qian (AD 365-427) and Xie Lingyun (AD 385-433) of the Six Dynasties Period and culminating in the classical poetry of Wang Wei, Li Bo and Du Fu of the Tang dynasty (AD 618-906). This represents a shift from the didactic to the affective power of natural imagery. Scenic elements of an ostensibly observed natural scene are not only described in vivid detail, but also integrated into the coherent order of the represented scene and establish correlative relationship with the emotional situation of the poet.

Tao Qian is credited with transforming the expectations of an occasional poem so that it reads less as an allusion to the political realm than as a reference to the life of the individual poet (for example, retirement). While he often employs natural images that carry long established conventional associations (such as the pine tree) by embedding them within passages of detailed descriptions, they are naturalized by the reader as integral parts of the visualized world of the poem. The natural images are read not only as a description of an ostensibly perceived scene, but also as making personal reference to the poet's state of mind.

In the landscape poetry of Xie Lingyun, nature is even more precisely described than in the poetry of Tao Qian. However, it is not a detailed description of nature for its own sake, nor is it meant to convey symbolic or philosophical overtones. In the absence of natural images replete with conventional associations, Xie Lingyun's landscape poems are read as autobiographical narratives whose references are largely personal. The detailing of his perceptions and reactions to apparently observed scenery and his engagement with it carry meanings that establish a relation to the poet's state of mind. This is explicitly brought out in summary statements at the end of his poems.

In the Tang dynasty, this led to a significant reformulation of aesthetic theory, one in which the poet adopts a more receptive attitude and responds spontaneously to the world around him. This is a position informed by Daoist and Buddhist ideals, an embodied subjectivity that enables the poet to lodge his mind in the objects of the world in such a way that they can be imbued with emotional and intellectual content.

In the poetry of Wang Wei and Li Bo, informed by Daoist and Buddhist thought, the agency of the poet as authorial or poetic subject yields to the active presence of the objects of the natural world and defers to natural images to suggest emotion. In Du Fu's poetry, images of self and images of the world are so intertwined as to present, at one level, coherent scenes with a vividness and perceptual accuracy and, at another level, imagery that evokes an unstated emotional and/or intellectual 'meaning beyond the words'. *Ershisi shipin (The Twenty-four Types of Poetry)*, by the late Tang poet-critic Sikong Tu (837-908), exemplifies the move toward a poetry that employs natural images of the object world 'to suggest something ineffable and intangible'. The description of nature in his poems embodies the notion of going beyond the words of the poem, pointing to that which lies beyond words.

Although Confucian canonical exegetes focused on the moral implications and didactic force of poetic images of nature, and non-canonical critics focused on the way natural images come to embody human feelings, their premises were nevertheless identical. In the words of Fang Hui (1227-96), 'the profound meaning of the comparison and stimulus is to establish the secret links that hold together all things in the universe' (Yu 1987: 217). Lastly, there was an unstated assumption that all poetry, be it canonical or non-canonical, makes ultimate reference to the world of the poet.

3 Calligraphy and painting

The ethico-aesthetic practice of Chinese calligraphy and, by extension, Chinese painting has its genesis in the ancient ritual practices (*li*) of the Zhou dynasty (1122 BC-221 BC), a formative period in Chinese civilization, which 'witnessed a transition from spirit-centred to human-centred ritual, from shaman-counsellors to sage-counsellors, from authority by virtue of one's position to authority of one's person' (Hall and Ames 1987: 87). One of the ways of seeking moral perfection, of becoming an authoritative person (*ren*), is through the practice of art as a means of self-cultivation (*xiushen*) (see Confucian philosophy, Chinese).

Calligraphy and music, two of the 'Six Arts' (*liuyi*) in classical Confucian thought, emerge from this formative period of Chinese culture as ritual aesthetic practices for the upper class, as disciplines of the body (*ti*) and mind/heart (*xin*), which engage the gentleman-scholar in the cultivation of the self. *Xiushen* ('self-cultivation',

literally 'cultivation of the body') speaks to the 'importance of taking care of one's body as a necessary condition for learning to be human' (Tu 1985: 96) (see Self-cultivation, Chinese theories of). In this respect it is interesting to note that, 'Etymologically the character *yi*, which is commonly rendered as "art", signifies the activity of planting of [sic] cultivating fields' (Tu 1983: 60). Noting the cognate relation between the characters for 'ritual action' (*li*) and 'body' (*ti*), it is interesting to observe that 'li actions are embodiments or formalizations of meaning and value that accumulate to constitute a cultural tradition' (Hall and Ames 1987: 88).

The idea that art can serve as a means of self-cultivation finds its earliest expression in a passage on the meaning of music in the *Liji (Book of Rites)*: 'The perfection of virtue is primary, and the perfection of art follows afterward' (*Liji* 17, 3, §5, in Cahill 1966: 122). An affirmation of the practice of art can also be found in the following statement by Confucius: 'The Master said, Set your heart upon the Way, support yourself by its power, lean upon Goodness, seek delight in the arts' (*Lunyu* 7, 6, §§1-4, in Ledderose 1979: 29).

The concept of the Six Arts did not survive the fall of the Han Dynasty. During the Six Dynasties period, under the influence neo-Daoism and Buddhism, the perfection of selfhood came to be conceived as a 'dynamic process of spiritual development' whose internal generative force was often said to be heavenly endowed in nature. It was during this time that members of China's cultured scholarly elite adopted the practice of calligraphy and the playing of the lute (van Gulick 1969) as the specific means to pursue aesthetic self-expression and self-cultivation. As Tu Wei-ming has noted, 'One learns to play the lute or to sing lyric songs in order to communicate with others and, more importantly perhaps, to experience the internal resonance one shares with nature' (Tu 1983: 62).

In neo-Daoist inspired calligraphy of the Eastern Jin dynasty (AD 317-420), for example, the metaphysical principle *ziran* ('naturalness' or 'self-so-ing'), an impersonal creative potential, is cited as one of the most important aesthetic principles. The Northern Song calligrapher/connoisseur Mi Fu (1052-1107) reserved the aesthetic ideal of *tianzhen* (natural perfection) to praise the calligraphy of the Eastern Jin master Wang Xianzhi (AD 344-88). Lothar Ledderose has observed that: 'plain tranquillity (*pingdan*) and natural perfection (*tianzhen*) were not only stylistic and aesthetic concepts which could be used to describe and evaluate works of calligraphy, but these terms also described the ideal state of mind of the artist' (Ledderose 1979: 58). According to Mi Fu: 'the movement of the brush should come swiftly with a natural perfection and emerge unintentionally' (Ledderose 1979: 64). An appeal to an egoistic source of creativity would simply be unthinkable.

One of the distinguishing features of early Chinese aesthetic discourse is a predominance of physiological and nature imagery. The following passage from the *Bizhen tu (Diagram of the Battle Formation of the Brush)*, an early text attributed variously to Wei Furen (AD 272-349) and Wang Xizhi (AD 321-379), exemplifies the way in which the aesthetic discourse on Chinese calligraphy is framed in the terminology of human physiology:

> Calligraphy by those good in brush strength has much bone; that by those not good in brush strength has much flesh. Calligraphy that has much bone but slight flesh is called sinew-writing; that with much flesh but slight bone is called ink-pig. Calligraphy with much strength and rich in sinew is of sage-like quality; that with neither strength nor sinew is sick. Every writer proceeds in accordance with the manifestation of their digestion and respiration of energy, *hsiao-hsi* [*xaoxi*].

(*Bizhen tu*, in Hay 1983: 85)

In another passage in the *Bizhen tu*, images from nature are used to characterize the ideal rendering of the seven strokes that represent the so-called 'diagram of the battle formation of the brush':

> First stroke - like a cloud formation stretching a thousand *li*; indistinct, but not without form.
> Second stroke - like a stone falling from a high peak, bouncing and crashing, about to shatter.
> Third stroke - the tusk of an elephant or rhinoceros (thrust into and) broken by the ground.
> Fourth stroke - fired from a three-thousand pound crossbow.
> Fifth stroke - a withered vine, ten thousand years old.
> Sixth stroke - crashing waves or rolling thunder.
> Seventh stroke - the sinews and joints of a mighty bow.

(*Bizhen tu*, in Barnhart 1964: 16)

The deployment of metaphorical imagery, referencing the human body and nature in Chinese aesthetic theory, is

not simply a rhetorical flourish but, in fact, serves a specific epistemological function. It constitutes an indigenous correlative rhetoric stemming from the Chinese view of spiritual development that sought within the ritual aesthetic acts of self-cultivation to embody patterns of behaviour deemed consonant with the immanent patterns perceived within the natural order of things.

The concepts of *lei* ('kind' or 'categorical correlation') and *ganlei* 'responding according to categorical correlation', which were fundamental to early Chinese poetic theory, play a prominent role in Zong Bing's (375-443) essay *Hua shanshui xu (A Preface to the Painting of Mountains and Rivers)*, the earliest extant philosophical treatise on painting written in China. This can be illustrated in the following passage:

> Now the Sage, with his spirit realizes the Way; thus the worthy can pass through it. Mountains and rivers (likewise), with their forms, relish the way; thus the virtuous can enjoy it. How similar they are to each other!
> (*Hua shanshui xu*, in Munakata 1983: 118)

The reference to 'mountains and rivers' alludes to the Chinese term for landscape painting, *shanshui hua* (literally, 'mountain-water painting'). Zong Bing's categorical correlation of the 'Sage' and 'mountains and rivers' brings to mind a passage from the Confucian *Lunyu (Analects)*:

> The Master said, 'The wise [*zhi*] find joy in water [*shui*]; the benevolent [*ren*] find joy in mountains. The wise are active [*dong*]; the benevolent are still [*jing*]. The wise are joyful [*le*]; the benevolent are long-lived [*shou*]'.
> (*Lunyu*, in Lau 1992: 53)

The mountains and waters thus come to symbolize, respectively, the dimensions of constancy and change and, by metaphorical extension, tradition and its creative adaptation to the conditions of an ever-changing present.

The correlative rhetoric of *ganlei* was soon eclipsed by such physiological concepts as *qi* (vital force or energy flow) or *qiyun* (resonance of vital force,) and *xue* (blood) or *xuemo* (blood-pulse). *Qi* is variously translated as 'breath', 'spirit' or 'energy': the vital force that animates life (see Qi). *Xue* or *xuemo*, when it appears in discussions on calligraphy, refers to the energy functioning through the rhythmic flow of the ink within and between the characters. The quintessential use of *qi* as an aesthetic term appears in the *Liufa* or 'Six Laws' of painting by the portrait painter and theorist Xie He in the early sixth century AD. The first, and thus most important, of Xie He's laws is '*Qiyun shengdong*' which can be translated as 'life-movement [is achieved through] spirit resonance (or resonance of vital force)'. *Xue*, or the energy functioning through the rhythmic flow of the ink, is implied in the second of Xie He's laws of painting, '*Gufa yongbi*' or 'bone-method (that is, inner structure) when wielding the brush'. This can be interpreted as indicating the precise way in which to achieve 'spirit resonance'. Painting and calligraphy are thus conceived as configurations of energy, materializing through the brush into the traces of ink.

Chinese medical treatises have been shown to be another important source for the deployment of metaphorical imagery referencing the human body and nature in Chinese aesthetic theory. Previously, it was noted that ritual aesthetic acts of self-cultivation embody patterns of behaviour deemed consonant with the immanent patterns perceived within the natural order of things. In traditional Chinese medical treatises, the body is conceived as a system or network of patterned energy flow and transformation, that is, as a microcosmic correlative of the macrocosmic world of nature. Painting and calligraphy, conceived as configurations of energy materializing through movements of the brush into the traces of ink, thus came to be seen as ways of capturing the patterns of *shengdong* or 'life movement' of the phenomenal world.

The *Bifaji (A Note on the Art of the Brush)* of Jing Hao in the early tenth century is a reformulation of Xie He's 'Six Laws' for the purpose of representing the landscape. Jing Hao was a Confucian scholar-painter who, during the social and political turmoil of the Five Dynasties Period, retired to the Taihang mountains of Southern Shenxi. The centrepiece of the *Bifaji* is the Six Essentials in painting a landscape, reported to have been conveyed to the author/narrator by a rustic old man whom he came upon while painting in the Stone Drum Cave:

> Spirit (*qi*) is obtained when your mind moves along with the movement of the brush and does not hesitate in delineating images. Resonance (*yun*) is obtained when you establish forms while hiding [obvious] traces of the brush, and perfect them by observing the proprieties and avoiding vulgarity. Thought (*si*) is obtained when you grasp essential forms eliminating unnecessary details [in your observation of nature], and let your ideas

crystallize into forms to be represented.

(*Bifaji*, in Munakata 1974: 12)

These first three essentials of landscape painting prescribe artistic norms and conventions for the use of brush and ink that are self-effacing, concealing all traces of the material or formal process of representation and thus, by implication, all traces of personal expression in order to give transparent access to that which is represented. Jing Hao's 'Six Essentials of Painting' exhibits the influence of neo-Confucian values when it emphasizes the disclosure and transmission, through the receptive mind and the responsive hand of the painter, of the immanent patterns of nature in terms of the rhythmic patterned relations of the painted landscape forms.

4 Literati aesthetics

The re-establishment of national unity and order under the Song dynasty (960-1279) ushered in social and political conditions conducive to the formulation of a new literati aesthetic. The feudal aristocracy of landed gentry, prominent during the Tang dynasty, gave way in the Song to an 'aristocracy of merit' (Bush 1971: 4), a 'meritocracy', as civil service examinations provided truly talented scholars with access to high government office. Towards the end of the Northern Song (960-1126), a new and distinctive literati style of painting and calligraphy began to develop among a small circle of scholar-officials. A literati aesthetic theory was also formulated in an attempt to define the artistic and social identity of what the great Song poet and calligrapher Su Shi (1037-1101) referred to as *shiren hua* (scholar's art), in contradistinction to that of the professional painter and calligrapher. Where professional artists were dependent upon and sought the patronage of others for their livelihood, the literatus engaged in the practice of painting and calligraphy as means of self-cultivation, self-expression and social exchange with other, like-minded scholars. To this end, the literati style placed less emphasis on the descriptive depiction of nature, choosing rather to foreground the expressive potentialities of a more 'calligraphic' handling of the brush. A key tenet of literati aesthetics, the claim of equivalence between literati painting and poetry, appears in an inscription written by Su Shi on a painting by the great Tang poet Wang Wei: 'When one savors Mo-chieh's [Mojie's] poems, there are paintings in them, /When one looks at Mo-chieh's pictures, there are poems' (Bush 1971: 25), became one of the defining features of the literati aesthetic.

Song literati aesthetic theory discounted the mere technical skill of the professional painter to represent nature, in favour of what would come to be termed *xieyi*, 'to sketch, or paint ideas'. Terms such as *chu* (mood or flavour) and *pingdan* (plain tranquility) figure prominently in the writings of Mi Fu (1052-1107) and his son, Mi Yuren (1086-1165). These aesthetic terms identify the emotionally nuanced *yi* ('quality', or 'idea') of a scene, which can only come to artistic expression through the cultivated sensibilities of the literatus. For example, in Mi Fu's opinion: 'When Chu-jan [Zhuran] was young, he made many [forms like] 'alum lumps'; when he was older, in his tranquility (*pingdan*) the flavor (*chu*) was lofty' (Bush 1971: 68). *Pingdan* is 'a simplicity with underlying depth' (Bush 1971: 72).

During the succeeding Mongol Yuan dynasty (1260-1368), literati theory consciously stressed the non-professional status of the scholar-painter and the expressive, non-representational style of literati painting. There were two schools of literati aesthetics: classicist and individualist. Zhao Mengfu (1254-1322), a brilliant painter and calligrapher, is identified with the classicist position. A traditionalist, Zhao Mengfu stressed the importance of *guyi*, or the 'sense of antiquity':

> A sense of antiquity is essential in painting. If there is no sense of antiquity, then although a work is skillful, it is without value. Modern painters only know how to use the brush in a detailed manner and apply colours abundantly, and then think that they are competent artists. The fact is that if a sense of antiquity is lacking, all types of faults appear throughout a work, and why should one look at it? What I paint seems to be summary and rough, but connoisseurs realize that it is close to the ancients, and so consider it beautiful.

(Bush 1971: 121-2)

A more individualist position is asserted by such reclusive scholar-painters as Wu Zhen and Ni Zan (1301-74). Often, as in the following colophon by Ni Can (dated 1368), there is a self-conscious affirmation of the status of literati painting as merely 'ink-play' (*moxi*) in which great liberty is taken in the rendering of motifs in the interest of expressing the artist's mood:

> Chang I-chung [Zhang Yizhong] always likes my bamboo paintings. I do bamboo simply to express the untrammeled spirit (*yiqi*) in my breast. Then how can I judge whether it is like something or not; where its leaves are luxuriant or sparse, its branches slanting or straight? Often when I have daubed and rubbed awhile, others seeing this take it to be hemp or rushes. Since I cannot bring myself to argue that it is truly bamboo, then what of the onlookers? I simply do not know what sort of things I-chung is seeing.
>
> (Bush and Shih 1985: 280)

In the Ming dynasty (1368-1644), China is once again under native rule. Aesthetic theory as well as artistic practice come to take on an art historical dimension, as scholar-painters explicitly re-assert their social and artistic identity within a lineage of literati painters and calligraphers that is traced back through the Yuan and Song to the patriarchs of the tradition, Wang Wei, Dong Yuan and Zhuran. Towards the end of the Ming, this tendency culminates in the formulation of the theory of the 'Northern and Southern Schools' of painting (*nanbei pai*). Attributed to Dong Qichang (1555-1636), this theory systematically establishes the canon of literati painting and calligraphy (the Southern School) as the orthodox tradition for future generations of scholar-painters.

Dong Qichang formulates an aesthetic theory and artistic practice that synthesizes the classicist and individualist tendencies of the preceding Yuan dynasty. For the late Ming master, the proper approach to the canonical art of the past is one of a 'creative imitation' (*fang*) and 'transformation' (*bian*) within one's own personal style in a way that will allow one to speak with authority to the historical and art historical conditions of the present. Dong Qichang writes:

> Chu-jan [Zhuran] followed [imitated] Tung Yuan [Dong Yuan], Mi Fu followed Tung Yuan, Huang Kung-wang [Huang Gongwang] and Ni Tsan [Ni Can] both followed Tung Yuan. It was all the same Tung Yuan, but there several [versions of his style] did not resemble each other. If another kind of painter had done it, it would have been just like a copy. How could anything done that way be transmitted down through the ages?
>
> (Cahill 1982: 123)

It is precisely through an interpretive re-inscription or 'embodiment' of the 'orthodox' tradition within his own body of artistic expression, that the scholar-painter, sanctioned by the past, comes to signify himself in the present. Dong Qichang's notions of *shenhui* (communion of the spirit), *fang* (creative imitation) and *bian* (transformation) established the basis for both the Orthodox and Individualist Schools of literati painting in the Qing dynasty (1645-1912).

Aesthetics, Japanese

While the terms 'aesthetics' and 'philosophy' were only introduced into Japan during the Meiji Period (post 1868), Japanese culture has nevertheless witnessed the proliferation of various arts and theories of art for over a millenium. Given that 'aesthetics' generally connotes a scientific, often taxonomic approach to the inquiry into beauty and art, it may be preferable to consider Japanese art and theories of art from the perspective of different ways of artistry, rather than impose on it alien categories and assumptions. Even our understanding about what constitutes art must alter when we consider such arts as the production of incense, the tea ceremony, the martial arts or flower arrangement, most of which do not have precise analogues in the West; or if they do, are not considered arts alongside poetry, drama, music and painting.

One of the hallmarks of Japanese art is the emphasis on an awareness of nature. Not only is the natural world a rich storehouse of images and metaphors for use as subject matter, but it is also the means whereby the practices, values and aspirations of the art are defined. Significantly, art itself is seen to be catalysed directly by an encounter with the natural world. All living beings, we are told, are given to song. Yet the natural world also came to be a shibboleth in society among the members of the Japanese court, where a finely honed seasonal awareness came to attest to the refinement and sensibility of the individual. Of all the arts, poetry was seen as pre-eminent, in part because of poetry's powers to influence the spirits inherent in the natural world. Even the emphasis on place and place-names in Japanese art may be traced to an understanding of the Japanese landscape and language as sacredly imbued.

Another feature of Japanese art and theories of art is its orientation toward the human. In other words, we may define Japanese art as 'expressive-affective' in its configuration, stressing the experience of the artist as well as the response of the audience in encountering such a work. In fact, the two roles of artist and audience are related through the focus of the work of art, which usually frames a single moment and its quintessential significance, hon-i, *which is unchanging. The quality which ideally characterizes both artist and audience is* makoto *or sincerity, underlining the point that the function of most Japanese art is to make us feel, rather than think.*

As in a number of other traditions, Japanese ways of art are bound up inextricably with issues of religion and religious practice. Not only did Shintō animatism have a profound impact on how Japanese viewed their landscape as well as their own lives, but other imported systems of belief also influenced the course of artistic development, especially Buddhism. Buddhism darkened the hues of classical Japanese art by introducing ideas such as mappō *(Latter Days of the Law), which saw the present as degraded and corrupt with respect to the past, and* mujō *(inconstancy), or the awareness of the ephemerality of this phenomenal world. In Mahāyāna Buddhism, art was perceived as a means of religious awakening, both in the case of poetry viewed as a form of intense meditation (*shikan*) and as parables whereby the truth could be disseminated obliquely (*hōben*). This paved the way for the pursuit of various forms of art to become a path (*michi*) to spiritual awareness. The relation of teacher and student in an art form closely resembled the relation of spiritual master to disciple, a feature which is echoed in the various 'secret' artistic treatises whose form, approach and significance suggest esoteric Buddhist manuals setting forth precepts for future generations.*

Japanese theories of art also concerned themselves with various aesthetic ideals, distillations of the changing notion of beauty in each era. From aware *(the beauty inherent in transience) and* miyabi *(courtly beauty) during the Heian Period (784-1185), to* yūgen *(the beauty of mystery and overtones) and* sabi *(the beauty of desolation and loneliness) in the medieval period, finally to* wabi *(the beauty of dearth and the humble) and* karumi *(the beauty of playful lightness) during the Edo Period (1600-1868), to mention only a few of the many ideals, we see an evolution of ideals as a response to cultural and historical change.*

What becomes evident in any survey is the assumption of an underlying unity, as in the notions that the impulse toward art is natural and universal; that art functions as a bridge mediating the experience of artist and audience; that sincerity and heart are to be privileged above all other qualities; and that the discipline of art can be a means of spiritual awakening. But we also discover that ideas, such as play, are critical to all forms of art in Japan. Other issues have surfaced periodically in various art forms in the course of Japanese history, such as the struggle between tradition and innovation or the debate about art as spontaneous versus art as the product of careful cultivation (that is, the question of artifice in art), or the question of the singularity of Japanese art.

1 Art, poetry and the natural world

Any sustained encounter with Japanese art or theories of art reveals the importance of the natural world, in the form of images of seasonal beauty, organic metaphors derived from natural objects and processes, and the identification of the internal psychological landscape with the natural world. Further, within the notion of the natural world lies embedded the importance of specific places within the landscape of Japan, which serve as touchstones to which art frequently alludes.

The twenty-one imperially commissioned anthologies of classical Japanese poetry (*chokusenshū*), compiled from the tenth to the fifteenth centuries, illustrate well the ubiquity of natural images and topics; each anthology devotes the first six books specifically to seasonal poems (two each for spring and autumn with one for summer and one for winter) and the remaining books, which focus on travel, love, sorrow and miscellaneous topics, are also replete with natural images. Similarly, most visual art focuses on scenes of natural beauty or wonder, ranging from the three classical beauty spots in Japan known as *nihon sankei* (Matsushima, Amanohashidate and Itsukushima) to typical scenes of enduring beauty (such as cranes amidst the pines) or seasonal beauty (brilliantly coloured autumn foliage) to a single object, such as a fish, in the natural world. In fact, the Edo period court painter Tosa Mitsuoki in the *Honchō Gahō Taiden (The Authoritative Summary of the Rules of Japanese Painting)* stresses: 'Anyone who wishes to learn the art of painting should first study the way of things in nature' (Ueda 1967: 31).

Other arts, such as flower arrangement or garden design, have as their explicit object the representation in miniature of the natural world. For example, in the *Sakuteiki (Notes on Garden Design)*, an eleventh-century manual by the courtier Tachibana no Toshitsuna, we are instructed from the outset:

> You should design each part of the garden tastefully, recalling your memories of how nature presented itself for each feature…. Think over the famous places of scenic beauty throughout the land, and… design your garden with the mood of harmony, modelling after the general air of such places.
>
> (Slawson 1987: 57)

Even arts which seem somewhat removed from the natural world (music, calligraphy, incense, swordsmanship) view themselves in some measure as representational arts and use natural images and metaphors taken from life to describe elements of their art, especially the epiphanic culmination of beauty in their art, as in the notion of the Flower (*hana*).

Indeed, while it becomes imperative for the student of any art in Japan to begin by studying nature, it is clearly not enough to have a general feel of the natural world. Instead we are commended to study nature precisely and minutely. The greatest *haiku* poet, Matsuo Bashō, according to his disciple Hattori Dohō, once commented, 'If you wish to learn about a pine, go to a pine and if you wish to learn about bamboo, go to bamboo.' This notion was often echoed by later writers such as the modern poet Masaoka Shiki, who advocated a theory of poetry known as *shasei* (sketch from life) as embodied in his statement: 'If you have the time to sit at a desk and read a book on *tanka* [classical poetry], you should instead pick up a cane and go for a leisurely walk along a path in the woods' (Ueda 1983: 19).

In the course of Japanese cultural history, however, the natural world as embodied in art did not simply realistically reflect external reality. Instead, beginning especially in the courtly Heian Period (784-1185), certain elements of the natural world were deemed to be worthy of inclusion into art, such as cherry blossoms, maple leaves, warblers and frogs, while other natural beings and objects, such as mudsnails, onions, the flowers of maple trees and foliage of cherry trees, were either discarded or ignored entirely. These elements obviously do exist in nature, but courtly poetic decorum eliminated them from the vocabulary of art. Not until the radical rejection of canonical poetic vocabulary by the Kyōgoku-Reizei school in the fourteenth century do we see dogs appear in formal poetry, for example, and it is really with the advent of *haikai* (comic linked-verse poetry) that we see such lowly elements as fleas and lice included as a matter of course.

If the study of the natural world, however circumscribed, seems necessary to the production of good art, it is also true that the genesis of art itself traditionally emerges from a direct encounter with the natural world. For example, Ki no Tsurayuki's [Japanese] Preface to the *Kokinwakashū (The Anthology of Japanese Poetry Ancient and Modern)* (*circa* 905), the *locus classicus* of theories of art in Japan, begins:

> Japanese poetry has the human heart for its seed and burgeons forth into myriad words as its leaves. Human beings in this world confront a plethora of experiences, and, hence, they give utterance to the concerns in their hearts through the sights and sounds around them. When hearing the call of the warbler amidst the blossoms, and the cries of the frog dwelling in the waters, among all living beings, is there any who does not burst forth in song? It is poetry that effortlessly moves both heaven and earth, inspires pity in the unseen demons and gods around us, makes tender the connections between men and women, and consoles the hearts of raging warriors.
> (*Kokinwakashū*, in Rodd and Henkenius 1984)

For Tsurayuki, it is the natural world that inspires in us the desire to compose verse and in fact the poetic process itself is posited by him in organic terms, utilizing the metaphor of a plant sprouting.

Echoing the Chinese courtly predilection for appreciating the natural world seasonally (emphasizing autumn and spring), in part derived from the Daoist love of the natural world, Japanese poets typically have associated each season with particular flora and fauna (for example, plum blossoms with very early spring, bell crickets with autumn). Further, each season was paradigmatically embodied in a particular time of day as attested by the opening of the well-known *Makura no Sōshi (Pillow Book)* of the court lady Sei Shōnagon, which begins elliptically, 'In spring the dawn, in autumn the dusk… ' An appreciation and understanding of seasonality became a kind of shibboleth among the members of the court, in which the truly refined and courtly sensibility could be discriminated from the uncouth and insensitive through the tacit acknowledgement of or subtle allusion to the modalities of the calendar. In *renga* (linked verse) poetry, flora and fauna became catalogued quite strictly according to the months of the year. For example, we are told that in verse associated with the fifth month, one may mention nightingales, early summer showers, orange flowers and irises. In *haiku* (or *hokku*) poetry, which developed out of *renga*, this seasonal association was mandated in the form of *kigo* or seasonal words, in which through allusion to the month, season, flora, fauna, climatic phenomena, or seasonal occurrence such as a festival, one would indicate the season.

In addition to the widespread use of natural images and topics in various forms of art, the natural world also functioned as a kind of dynamic and resonant mirror to the internal landscape of human feeling. While the notion of 'pathetic fallacy', or the according of human emotion to the natural world, has been derided by some in the Western tradition, notably John Ruskin in the nineteenth century, in Japan it has held a place of overarching importance. The 'pathetic fallacy' in the West implies a heavy-handed anthropomorphizing of nature, for example, 'the heavens weeping rain'. In the Japanese tradition, by contrast, we discover that the natural world and human world serve to mirror one another as well as catalyse parallel feeling in one another, in a much more nuanced fashion. Hence, while autumn with its inevitable desolation of life, withered leaves, and cries of insects comes to embody melancholy, as it often has in Western forms of art, it also serves as an externalized psychological mirror for the human heart, as attested in this illustration from *Genji Monogatari (The Tale of Genji)*, when we are informed that following the death of the Emperor's beloved and his rejection of any substitute, 'His serving women were plunged into dew-drenched autumn'. It is both literally autumn and metaphorically autumn, and it is less that one catalyses the other than a parallel accord between the internal and external worlds.

The proliferation of natural imagery in Japanese art also incorporates a preoccupation with place - both generic, as in Tsurayuki's opening, and specific, as in Hiroshige Andō's series of woodblock prints (*ukiyo-e*) in the Edo Period (1600-1868) entitled 'Thirty-six Views of Mount Fuji'. Another illustration of the emphasis on specific place names may be found in the classical poetic rhetorical technique of *utamakura* (the citing of one or more traditional place names from the poetic catalogue, such as Mount Yoshino or Tatsuta River).

Beyond the superficial understanding of Japanese culture as intrinsically enamored of natural beauty, commentators have ascribed this concern with the natural world and with place to either spiritual or functionalist causes, in other words, as the result of the claims of the indigenous system of beliefs known as Shintō and its myriad divinities of the natural world (*kami*), or as the outcome of inhabiting a densely populated island nation, insular and keenly aware of land as precious. These surely have had an impact on the emergence of Japanese consciousness, but what remains obscure is what deeper relation art, especially verbal art, has with the natural world and the idea of place.

Of all the arts, poetry emerges as the most valued form, and one whose assumptions underlie each of the other arts.

Further, as we consider the various forms of art that emerged - painting, the study and production of different kinds of incense, flower arranging or sculpture - we detect the importance of the textual and verbal components of each of these arts. The supremacy of poetry among the arts derives not only from its influence on and presence in each of the arts, but also from its extraordinary efficacy, as suggested by the far-reaching claims of the quotation from the preface of the *Kokinwakashū* above.

We may of course ascribe the ubiquity of natural imagery and the pre-eminence of poetry among the different arts to the influence of Chinese culture on Japan, and indeed many of the images that Tsurayuki uses are derived from the Great Preface to the Chinese classic the *Shijing (Book of Songs)*, but even in the earliest poems as represented in the oldest texts (*Man'yōshū*, *Kojiki*, *Engi Shiki*) which betray relatively little trace of sinification, we may detect a preoccupation with poetry itself and its manifold powers. Tsurayuki notes in his preface the universality of poetry and how the impulse to sing is shared by all life, but alludes only offhandedly to how poetry is able to accomplish these things, as he speaks of poetry moving the hearts of gods and demons.

Apart from the hierarchy among arts in the course of Japanese cultural development to which we have already alluded, it is generally serious art, which demonstrates a concern with public conventions, that is privileged over comic or aberrant art, which is personal or idiosyncratic in nature. The folklorist-literary scholar Orikuchi Shinobu deduces from all of this that the genesis of poetry arose indeed from the intersection between art and nature, though not simply from lyrical rapture amidst the blossoms, but from ancient word-charms and spells, thought to have been bequeathed by the gods to human society to effect certain results in the natural world (prosperous harvests, purification, exorcism).

In support of this view, many have cited the famous passage in the *Kojiki*, which discusses the origin of the performing arts (drama-dance-mime) in the form of *Nō*, as illustrated by the gods themselves. In this episode, the Sun Goddess, Amaterasu Ōmikami, having been perturbed, has shut herself into a cave thereby relegating the world to darkness. The gods having tried various manoeuvres to persuade her to come out to no avail, another divinity, Ama no Uzume, manages to lure her out by means of a song and dance she performs while in a state of abandoned divine possession. This distracts the gods from their predicament, inspires curiosity in the Sun Goddess and causes all to become engrossed in her performance. It is through the clever and beguiling use of art that order is restored to the world and that the gods of the land themselves have been moved and reconciled. But while this narrative illustrates the placative function of verbal art in dealing with *kami* (spirits inhabiting the natural world), in other words its rhetorical ability to persuade the gods to alter their course of action, as well as suggesting song as a medium familiar to the gods, it does not account for the emphasis on place.

According to the literary critic Konishi Jin'ichi (1984), the problem of place may be resolved through an understanding of the idea of *kotodama* or 'word-spirit'. Various utterances, which could only be pronounced in particular contexts and particular places that were called *kotoage*, unleashed the power of the *kotodama* which could be either malign or benevolent. It was not their semantic or rhetorical capacity that produced these effects, but rather simply the utterance of those syllables by a human voice. He argues that the concept of *kotodama* (and hence the construction of such a term), as opposed to the living enactment of it in archaic Japan, only came much later after Japanese poets in their intercourse with the continent became aware of the singularity of their beliefs about language and the natural world. Since *kotodama* were only efficacious when released by the utterance of *kotoage* in purely Japanese language (with no foreign loan-words) and within Japan itself, there comes about a new understanding of the natural world and the places within it, whose names alone can activate the mighty powers inherent in language.

2 Art in its expressive-affective capacity

A number of critics have pointed out that virtually all Japanese art and theories of art betoken an expressive-affective orientation. In other words, rather than privileging the relation of a work to nature (art as representational or mimetic) or as an elaborate structure whose significance inheres principally in its formal properties, Japanese art emphasizes the relationship between the artist and the work of art as well as the relationship between the work of art and its audience.

More often than not, we are told, artists produce works, not because of a desire to assert themselves but because of an inability to restrain themselves. Tsurayuki's female narrator comments in his fictionalized diary *Tosa Nikki*

(Tosa Diary):

> I do not set down these words, nor did I compose the poem, out of mere love of writing. Surely both in China and Japan art is that which is created when we are unable to suppress our feelings.
>
> (Miner *et al.* 1985: 7)

We sense an urgency about art: as humans we are filled with emotions generated by experiences in this world, and we must express them in the form of art.

At its base, we may say that Japanese art is lyrical in nature; it highlights the emotional responses of an individual, or the group in the voice or person of an individual, to the natural world around. Hence we see comparatively little in the way of abstract, didactic or gnomic art, other than explicitly religious or heuristic works such as visual representations of Buddhas or neo-Confucian homilies. The principal function of most art is not to instruct directly (though the very cultivation of art may be seen as uplifting to character or, put more precisely, the pursuit of art necessitates the cultivation of a high moral discipline), but rather to allow the individual to manifest an outpouring of feelings in a resonant fashion that serves as gratifying release.

The focus of many works of art is the revelation of a single moment of being, to use Virginia Woolf's phrase, in which the intensity and purity of feeling and experience are transmuted into a thing of beauty. There is a spontaneity and singularity about the artistic moment, which of course is the culmination of much concentrated study of the art form, and which at particular moments of artistic inception allows the artist to produce a masterpiece without hesitation or conscious forethought. What a work of art offers us ideally is not the opportunity to uncover or unearth the mind or personality of the artist but the quintessential distillation of an authentic human experience amidst the natural world. It is not validity but sincerity (*makoto*) that we prize. Analogously, the affective relation between a work and its audience is intended not so much to make us think, but to make us feel. As a result, a tacit connection is effected between artist and audience which is mediated by the work of art.

Some critics and theorists structure their texts specifically towards the production of art such as Ki no Tsurayuki while others, such as Zeami, the great playwright and theorist of *Nō* theatre, stress the role of the audience in its appreciation of art as well as the development of the artist. The more cultivated the audience, the greater the inducement for artists to express themselves well. Thus, Zeami insists: 'It is crucial for the actor to perform in such a fashion so as to harmonize with the feelings of the nobility' (Rimer and Yamazaki 1984: 19). What is idealized is the reciprocal relation between the artist of impeccable sensibility and training and the audience, equally trained and possessed of a discriminating awareness, a relation which allows for the intuited sharing of fundamental experience.

While the focus of the artistic work is understood to be expressive-affective in its orientation, this does not preclude the notion of art as imitation (*monomane*). For example, Ōkura Toraakira in his *Warambegusa (For My Young Successors)* articulates the ideals of *kyōgen* theatre (comic interludes performed in between the more serious and weighty *Nō* dramas), asserting: 'More than anything else *kyōgen* is an art of imitation…. It imitates all kinds of things in this world' (Ueda 1967: 102). However, while *monomane* sounds very much like the idea of mimesis, in fact it suggests less a connection with the object as it exists in the world, than the idealized essence of the object as realized in the realm of art. Zeami mentions the principle, 'first truly become the thing you are performing' (Rimer and Yamazaki 1984: 77), but he does not mean a performance along the lines of method-acting. By 'the thing', he means the reified and transmuted kernel of the role, what is sometimes called *hon-i*, or essential character as codified by artistic conventions, not the role as it is embodied in an actual being in society. Though *hon-i*, derived from a Chinese term *pen-i*, originally meant something like 'individual will or aspiration', it came to connote 'poetic intent', and thence 'fundamental character or nature'. As examples, the *hon-i* of cherry blossoms is embodied by beautiful transience, of travel by misery and loneliness; of age by regret and nostalgia. The artist in encountering the outside world does not in fact confront the real world, but rather the world of *hon-i* or codified essences, those very essences recognized as such by the audience. This is what Chikamatsu Monzaemon, the supreme playwright and arbiter of the Edo-period puppet theatre, *ningyō jōruri*, meant when he asserts, 'Art is that which exists in the slender gap between truth and falsehood.'

The notion of *hon-i* of course represents in part the world of accreted tradition against and atop of which artists inscribe their own work, and poses a critical dilemma about how artists can be authentic about their experience

even as their vision is filtered through the screen of tradition. However, *hon-i* is understood to be more than just convention; it is what Motoori Norinaga referred to as ‘the heart of things’ (*koto no kokoro* or *mono no kokoro*), that essential nature that is not subject to the vicissitudes of time (see Kokoro). Nevertheless, throughout the course of Japanese artistic development we may detect a fruitful tension in the form of tradition versus innovation that is crucial to the expressive-affective orientation, given the inevitable changes that each new generation must confront. Tsurayuki notes at the end of his preface to the *Kokinwakashū*, ‘Those who know poetry and who understand the heart of things will look up to the old and admire the new as they look up to and admire the moon in the broad sky’ (*Kokinwakashū*: 47). The medieval poets and critics, Fujiwara Shunzei and his son Teika, also address this issue in their well-known exhortation ‘old words, new heart’. According to Bashō’s disciple Kyorai:

> Of the *haiku* there is a style that remains unchanged for thousands of years. There is also a style that prospers only for a time. These are the two poles of the late Master’s teaching, and they are really the same in essence. They are the same, because they both resort to a single source, the poetic spirit.
>
> (Ueda 1967: 147)

Another implication of the emphasis on the expressive-affective orientation, the human aspect of the work of art, is the overriding importance placed on process as opposed to telos, goal or end. Almost all treatises on art in Japan discuss in great detail how artists can go about cultivating their art, rather than enumerate precisely the constituent features of a great work of art in the abstract. The twentieth-century philosopher Kuki Shūzō speaks of the traditional Japanese emphasis on process when he discusses the notion of *bitai* (coquetry) as a cultural ideal and how its evocation of *kanōsei* (possibility) makes it endlessly alluring. He speaks of how after the devastating 1923 Kanto earthquake, the Japanese quickly went about rebuilding the subway in the city of Tokyo, knowing of course that it could be destroyed at any point in time, to the amazement of Europeans for whom it seemed a doomed effort. Kuki explains that it is the process of construction and cultivation, not the end result, that sustains the Japanese will. Hence, he argues that from a Japanese perspective, the position of Sisyphus in Greek myth is quite a desirable one, since he will always be in the midst of a task, never having to confront the bleakness of completion or perfection.

3 Art and its relation to religion

The indigenous system of beliefs known as Shintō had a significant impact on the development of the arts in Japan (see Shintō) and, as some believe, literally gave rise to them in the form of the *kotodama*. Other forms of art associated with Shintō animatism (which has been described as a pre-animistic system which features belief in spiritual entities with non-human traits) include *kagura* (god’s music), *kamiasobi* (god’s dances), both of which contributed to the development of *Nō* theatre, *norito* (poem-like liturgical texts) and *setsuwa*, or short mythic narratives dealing with the deities and various creation themes, often orally related by professional narrators known as *kataribe*.

As an aside, the *kataribe*, who were often female, were thought to represent a transitional phase in verbal art between the stage of oral transmission and the advent of writing. In a world where memory was being displaced by written text, the *kataribe* functioned as a repository of group memories of ancient narratives until finally they were almost entirely displaced by written accounts in the highly literate late ninth century, when their only remaining function was limited to recitation of specific works at ceremonial times. According to Orikuchi Shinobu, these narratives, as well as poetry and proverbs, originated in the incantatory utterances of shamanesses who were possessed by the spirits of the *marebito*, or the visitor gods, who would descend at regular intervals into the human realm from the Land of the Eternal. Eventually, of the incantations divided into *ji* and *kotoba* sections (third-person and first-person assertions by the god respectively), the former developed into narrative art and the latter into poetry and proverbs. The narratives, no longer seen as the actual words of the gods, came to be related by female *kataribe*, presumably the secularized descendents of and successors to shamanesses who left their ancestral villages, and thus was born narrative art from religious beliefs.

Even more important was the impact of Buddhism on the arts of Japan, in terms of form, practice and understanding (see Buddhist philosophy, Japanese). It is noteworthy to remember that Buddhism was also the principal vehicle whereby writing was introduced into and popularized in Japan. Further, both the Tendai and Shingon sects, but especially Shingon with its emphasis on the symbolic understanding of essential truth as

conveyed in art, had a formidable impact on the development of courtly arts from the latter part of the ninth century onwards. Various arts were associated specifically with the religious practices of Buddhism, such as carved wooden statues of Buddhas and Bodhisattvas, the *bussokusekika* (the Buddha's Footprint Poems at Yakushiji in Nara), painted *mandaras* (cosmic diagrams of Buddhist figures), *jigoku-hen* (frightening hell screens designed to chasten unbelievers), and the texts of *Gozan bungaku* (the heavily Chinese-influenced literature of the Zen Buddhist monks of Kyoto and Kamakura during the Kamakura-Muromachi Period). While Jōdo (Pure Land) and Nichiren Buddhism held considerable sway over the populace, it was the esoteric sects as well as Zen that had the greatest influence on the practice of poetics and the development of the arts.

The two Buddhist concepts *mappō* and *mujō* substantially altered the outlook of poets and artists in the medieval period. *Mappō* (the Latter Days of the Law), known in Sanskrit as *Kaliyug* (the Dark Age), represents in the cyclical time of Mahāyāna Buddhism the final corrupt, decadent stage of life in which a Buddha is needed to be born on earth to enlighten the misguided and transmit the Law for the cycle to begin anew. In poetry and poetics, this resulted in the glorification of the past as a kind of Golden Age and the dismissal of the present as a barbarous era in a dismal state of decline. Hence, throughout poetic treatises and works of art we see evidence of this idea in the disdain shown for the present state of affairs and the nostalgia and reverence for the past. *Mujō*, the inconstancy of the phenomenal realm, like the earlier notion of *hakanasa* (ephemerality), underscored change as ineluctable in this world, but presented it in a much darker fashion. It no longer functions as an emblem of the beautiful, but that which we as deluded beings refuse to acknowledge, thereby bringing misery and suffering on ourselves (see Mujō). Both *mappō* and *mujō* discomfit us with our place in the present world and foreshadow the need for transcendence.

The paradoxical question of how art, itself rooted in the phenomenal world, can help us to transcend the unrelenting realities of this realm, was thought to be resolved through the evocation of the ideal of *hōben* (skill in means or expediency). In the *Hokkekyō (Lotus Sutra)*, the central scripture of Tendai Buddhism, Buddha is asked how one goes about teaching the truth to those ignorant of it and hence unable to recognize truth as truth. Buddha responds with the idea of *hōben* or heuristic aids, such as parables. Even though these are fictions, he explains, ironically they can help the ignorant to grasp some notion of truth, which eventually will lead to complete understanding. Thus, writers in the middle ages were fond of quoting the Tang Chinese poet Bo Zhuyi's famous phrase, *kyōgen kigo* (wild words and fancy phrases) as alluding to the possibilities of art as *hōben*: 'For many years have I hoped one thing, that my actions in this world and the sins resulting from my wild words and fancy phrases shall become ever after a means of paying homage to the Law and be allied to the dissemination of Buddha's truth. Let the countless Buddhas of the Three Realms hearken unto this.'

Thus even art, which does not seem to promulgate religious truth explicitly, may be seen to further the teachings of Buddha. Even a genre perceived to be as frivolous as *monogatari* or narrative may at heart be an instrument for Buddha's teachings. Art, though fictive, can serve to guide an audience indirectly to the higher truth and often with greater efficacy than any tract or scripture. This offers an interesting counterpoint to Sir Philip Sidney's *An Apology for Poetry*, in which he defends art against the criticism that as fiction it lies, by pointing out that since fiction avers nothing, it cannot be equated with falsehood.

Beyond its function as a conduit to truth, art may also serve as a direct means of religious awakening as addressed in the idea of poetry as a form of *shikan*, or the Tendai practice of intense and concentrated meditation. According to the *Maka Shikan (Great Cessation and Insight)*, one of the three great texts of the Tendai sect, by desisting from the impulse towards discrimination between objects in the world and concentrating on the integrity of each, we can gain insight into our own inner nature. Fujiwara Shunzei applies the insights garnered from this text to the composition of poetry. Poetry in this form of meditation allows us to dissolve polarities and distinctions, recognizing them as having significance only in the illusory phenomenal world, and in so doing, allows for a fundamental unity to be realized between the poet and the object. Thus, the very act of poetic composition as *shikan* enables us to achieve a higher spiritual awareness of self.

Just as Tendai laid the groundwork for Zen, so too did the notion of *shikan* shape the notion of *michi* (path or way) in its implications for the arts. By the fourteenth century, we see a number of arts subscribing to the Zen notion that any vocation, if pursued fervidly and with a purity of heart, can be a means to enlightenment in the form of *satori* or sudden awakening in this life. These include poetry, tea, flower arrangement, *Nō* theatre, martial arts such

as the art of the sword, and a host of others. What is significant about a *michi* is that it requires a singular devotion to the art form, the eschewal of base behaviour, a humble, almost monastic lifestyle, and the realization that the purpose of such a pursuit is neither power nor fame, nor any other mere gratification of the senses, but rather a lofty and transcendent goal which requires us to see into ourselves.

Following a *michi*, whether it be the way of *renga* or calligraphy, does not imply a solitary pursuit, but, more often than not, the attaching of oneself as a student to a teacher or master. The organization of most arts in Japan revolves around specific schools or lines of artistic inheritance known as *ie*. In many ways, this is the legacy of esoteric Buddhism with its emphasis on secret transmission of the innermost truths strictly from master to chief disciple. Just as Saichō (Dengyō Daishi) dispensed precepts for spiritual awakening to his chief disciples (*endonkai*), so too are artistic precepts passed through the *ie* system from master to disciple. Thus, we encounter the practice of *hidensho* or secret treatises, which purport to divulge the ultimate truth that can only be understood by those few chosen initiates. These were often written in a dense and elliptical style that precluded the ignorant from understanding the hidden implications. The *hidensho* were not substitutes for the master's teachings, but instead, since they consisted of generalized truths that could only be understood only by those already initiated into the arcane mysteries of the art, were meant to be passed down through the generations ensuring that the art form continued. In addition, they were proof in themselves of one's having received the mantle of authority in the particular art form. Thus, during the decades that followed the death of the great Fujiwara Teika, his descendents continued to dispute fiercely among themselves about the ownership of his writings and documents, which were simultaneously both a poetic and political inheritance.

The relation between teacher and student in the arts represents an almost sacred bond in which students abase themselves before the master as proof of their readiness to learn, paralleling the relation of monk to spiritual master. To belong to an *ie* headed by a lineal master means to subscribe to its rules, its practices, its dicta, and moreover to learn, not by reading or imagining or experimenting, but rather by direct emulation of the master's teachings. This teaching invariably takes the form of *kuden* or oral transmission, which is seen as far superior to anything transmittable in writing. Further, within esoteric traditions, *kuden* referred to those hermetic teachings, secret in nature, which revealed the ultimate truths. Given the importance placed on *kuden*, many traditional treatises in Japan take the form of *mondo* or catechistic question and answer, as if representing as closely as possible the actual oral transmission.

Though evident in certain periods, in certain genres and in the work of particular artists, both Confucianism and Daoism had much less direct influence than did Buddhism on the course of Japanese poetics and the arts. The didactic strain characteristic of Confucianism does surface on occasion, as in Edo Period literati homilies designed to 'praise virtue, castigate vice' (*kanzen choaku*), a phrase deriving from Confucianism that appears as early as Shōtoku Taishi's *Jūshichijō Kempō (Seventeen Article Constitution)* of 604 (see Shōtoku Constitution). Daoist ideas, while especially evident in certain of the writings of the Man'yō poets, become amalgamated with other forms of Japanese thought such as Zen, and thus manifests itself only indirectly in the general esteem for the natural world, and the borrowing of terms, such as the Chinese *feng-liu* as *fūryū*, or elegance (see below).

4 The historical development of traditional aesthetic ideals

When we look at pre-ninth century Japan, although we encounter a great body of art and poetry, we see little in the way of contemporary commentary on aesthetics and poetics. While later eras detect certain ideals implicit in this period, such as *makoto* (sincerity), *masuraoburi* (ideal of virility) or *man'yōgokoro* (the Man'yō spirit), in fact these ideals are anachronistic and represent an attempt to instill conceptions of art somewhat removed from the period. What the idealization of these elements reveals is an Edo-period nostalgia for an imagined simpler, more straightforward time, which precluded any outside influence and any notion of transcendence.

One of the earliest commentators on art was the Buddhist monk Kūkai (Kōbō Daishi), who in his *Bunkyōhifuron (Secret Treasury of Poetic Mirrors)* and *Bumpitsu genjinshō (Essentials of Poetry and Prose)* sought to introduce Chinese theories about verbal art into Japan. It is after this point that we detect the emergence of indigenous artistic ideals that, though indebted at some level to Chinese culture, represent singularly Japanese notions about art. The construction of aesthetic ideals arose mainly in the Heian Period as courtiers sought to codify matters of art into a coherent form that both set itself off from the domain of Chinese culture and art (principally of the Six Dynasties) and within Japan delineated the boundary line between those within and those outside the court.

Apart from critical terms, such as *kokoro* (heart), *kotoba* (words) and *sama* (style), one of the earliest ideals evident in Japan is *aware*, a term signifying poignant beauty that recurs a number of times in works such as *Genji monogatari* (a repository in fictional form for Heian responses to and understanding of art) and the imperially commissioned anthologies of poetry. In Heian Period usage, *aware* seems closely aligned with the idea of *hakanasa* or transience, suggesting the truism that what is sad is necessarily beautiful, and what is beautiful is sad. The notion of *kokoro* is central to the ideal of *aware*, since the capacity to be moved is a function of sensibility. In its approbation of *Genji* as the supreme work of fiction, the *Mumyōzōshi (Nameless Writings)*, *circa* 1200, a treatise in the form of a dialogue on *monogatari* or narrative, cites numerous instances of *aware* such as Yūgao's death, Genji's exile and Fujitsubo's becoming a nun and taking the tonsure.

Our modern understanding of *aware* depends in large measure on the Edo commentator Motoori Norinaga's conceptualizing of it in the form of *mono no aware* (the pathos of things), often seen as analogous to the expression *lacrimae rerum*. He explains *aware* as originating in two cries of wonderment at the world, 'Ah', and 'Hare'. While he notes that originally *aware* was used of anything that moved the human heart, later it came to be associated exclusively with the miserable or wretched. For Norinaga, *aware* symbolized the sensitivity to temporal beauty that defines the experience of creating or appreciating art.

The overall aesthetic of the court, especially in the Heian period, was referred to as *miyabi* (also read sometimes as *ga* in its Sino-Japanese reading) or courtly beauty, a beauty that was ornate, brilliant, and characterized by elegance. This is the kind of beauty personified by the title character Genji himself: handsome, refined, well-versed in all the arts, graceful in all his actions. It implies what the Renaissance writer Castiglione referred to as *sprezzatura*, an elegant nonchalance, as well as a peerless sensibility. Closely allied with it was the notion of *fūryū*, from the Chinese Daoist term *fengliu*, which originally connoted the elegant world enjoyed by the Immortals consisting of music, poetry, wine, and the world of desire. *Fūryū*, whose characters were read also as *miyabi* in Japanese, emphasized a fashionable chicness, brilliantly realized as well by the figure of Hikaru Genji, the Shining One. *Miyabi*, needless to say, eschewed anything touched by ugliness, poverty, or corroded by age.

In the late Heian and early part of the Kamakura Period, we see a new set of ideals emerge, the most important of these being *sabi* and *yūgen*, as propounded by Fujiwara Shunzei and his son Teika among others. This new era was heralded by active civil strife from 1183-85 in which the imperial family, various noble clans and the major Buddhist monasteries fractured internally and, in the ensuing conflict, many were eventually decimated. Hence the tone of these new ideals was much darker and more tinctured by the Buddhist notion of the inconstancy (*mujō*) of this phenomenal and deluded world. *Sabi*, or the ideal of loneliness or desolation, remains one of the most enduring ideals in the course of Japanese cultural development, playing a significant role in various arts such as the tea ceremony, flower arrangement and brushed ink painting, as well as later forms of poetry such as the *haikai* of Bashō. *Sabi*, in sharp contrast to *miyabi*, is subdued, monochromatic in hue, and melancholic in tone. We see the opposition of these two ideals in this poem by Teika:

> Miwataseba
>
> hana mo momiji mo
>
> nakarikeri
>
> ura no tomaya no
>
> aki no yugure
>
> (As I gaze out, both cherry blossoms and maple leaves are absent, instead grass-thatched huts in the autumn gloaming.)

(*Shinkokinwakashū* 4: 363)

Instead of the gorgeous and conventional images of vernal and autumnal beauty, we are presented with an alternate image of isolated, unadorned, and barely discernible beauty. *Sabi* implicitly acknowledges the darkness of life, even as it reconstructs the misery into a thing of quiet beauty. While Shunzei also favored the ideal of *aware*, similar in content if not in tone or affect, the austerity of *sabi* became the hallmark of his work and this period in Japan. In the hands of later poets, such as Matsuo Bashō, *sabi* or loneliness became conflated with *sabi*, a

homophonous word for rust, and thus is transformed into the antithesis of *miyabi*, the beauty of the extraordinary giving way to the beauty of the ordinary, the sere, the solitary.

Another ideal developed by Shunzei's son Teika in his early formulations was the notion of *yōen* or ethereal charm. This, like many other concepts, had its origin in Chinese poetics and signified a dreamy, feminine, winsome beauty of a sort associated with the delicacy of a fragrant blossom or the romance and magic of a spring evening. In its emphasis on transcendent possibility and the resonance of *yojō* or overtones, *yōen* is not unrelated to *yūgen*, perhaps the most profound and ineffable of all Japanese aesthetic ideals. *Yūgen*, the style of mysterious beauty or alternately mystery and depth, was originally a Buddhist term meaning 'obscure, dim, or deep', but was elevated by Shunzei into an aesthetic ideal suggesting great subtlety, complexity and reverberation. *Yūgen* portends an otherworldly atmosphere that hints at but never elucidates fully the possibility of transcendent vision.

Zeami also borrows the notion of *yūgen* from poetry and employs it in his discussions on drama, noting: 'Particularly in the *Nō*, *yūgen* can be regarded as the highest principle.' However, his understanding of it suggests more the mastery of elegant beauty and grace than what is suggested by the use of *yūgen* in poetry. Still, even in *Nō*, *yūgen* continues to represent an elusive ideal that is the culmination of artistic endeavour.

The cultural shifts of the fifteenth and sixteenth centuries foreshadowed the aesthetic ideals of the Edo period, with their emphasis on quotidian life amidst the newly urbanized lower social strata as embodied in the townsmen or *chōnin* class. Sen no Rikyū, the acknowledged master of *sadō* (or *chadō*), the tea ceremony, according to his student Nambo Sokei, preferred above all other ideals *wabi* or the beauty of impoverishment. He remarks, 'There should be a dearth of tea implements in the room', and advises that these few objects should be arrayed simply. Among the many revealing anecdotes related about him is the story of his deliberating mutilating a vase to use in tea ceremony as a reminder to us of the beauty inherent in the imperfect and the shabby.

Bashō, the *haiku* master, embraced the ideals of earlier ages, especially the notion of *sabi*, but sought to mitigate *sabi* first through the humanizing notion of *wabi* and then through the ideal of *karumi* (lightness). *Sabi*, with its unrelieved austerity and detachment, was in some ways as alien to the common people as the earlier *miyabi* had been, and hence Bashō sought to include the commonplace, the humble and the destitute, as well as the simple, the playful and the light-hearted, in his work in order to suggest a more encompassing aesthetic for his age. While *wabi* helped to convey a more humanistic and egalitarian ideal, in that by elevating the disfigured and the discarded we attest indirectly to the resilience and beauty of imperfect humanity, the notion of *karumi* or lightness proved to be central to his poetry in relieving the weight and darkness implied by *sabi*. Both *wabi* and *karumi* are evident in a verse such as this excerpted from a *haikai* sequence:

> Te no hira ni
>
> shirami hawasuru
>
> hana no kage
>
> (In the palm of my hand, the lice crawl forth, in the shade of cherry blossoms)

The humble image of lice, juxtaposed with the traditionally exalted cherry blossoms, is framed by the human observer's eye and hand to produce a poem of considerable whimsy and poignancy.

One last major aesthetic ideal known as *iki* (the ideal of the chic or stylish) emerged in the late Edo period among the female entertainers of the cities of Edo. *Iki* paralleled the ideal of *sui* (written with the same character signifying essence), which dominated in western Japan, but was much less constrained, ornate and traditional as a fashion. *Iki* in its casual nonchalance and disdain for convention suited well the character of Edo, unburdened by many centuries of tradition, and came to symbolize the pragmatic surface coolness belying the sentiment welling up within, characteristic of this period dominated by urban, mercantile values.

5 The unity of the arts and the identity of the nation

Far more than the art and aesthetic theories of other cultures and traditions, those of Japan betray a remarkable uniformity in their underlying assumptions regarding the nature of art, its provenance and its aims. For example, one shared quality (not discussed above), the idea of playfulness, appears in virtually every art form from the

comic narrative about the plump, middle-aged goddess Ama no Uzume luring the Sun Goddess from her cave by means of a lascivious primordial striptease, to the courtly game competitions known as *monoawase*, which involved the wagering of iris roots, pictures, poetry or virtually any object, to the various kinds of playful poetry including the courtly *oriku* or acrostic, the *darumauta* or nonsense poetry associated with Zen practices in the medieval period, and the satiric, often bawdy poetry known as *senryū* produced in the Edo period. While art is not always ironic or comic, the notion of art as serious play or pasttime prevails across the various genres and modalities of artistic expression in Japan. Even the preference shown by the aristocratic elite for the gifted amateur in the arts, as opposed to the professional, while indeed betraying the influence of Chinese literati notions, also demonstrates this principle of play as being central to art in Japan. Play does not stand in opposition to *makoto* (sincerity); if anything, it attests to it.

Many schemas have been proposed for understanding Japanese art as an integrated unity. The literary critic Donald Keene, for example, offers us a formalist grid in which four qualities recapitulate the notion of beauty within the boundaries of Japanese art and aesthetics: suggestion, irregularity, simplicity and perishability. These can be associated with the ideals that arose in specific historic contexts (that is, *yojō* or *yūgen*; *wabi*; *sabi*; and *hakanasa* or*mujō*), but represent as well enduring concepts that characterize the landscape of Japanese art from tea ceremony to calligraphy to garden design to poetry.

By contrast, other schemas that have been proposed imply an ideological difference that functions to distinguish Japanese art from any other. Konishi Jin'ichi invokes a polar struggle in the tension between what he terms the poles of 'consummation' and 'infinity' in the ubiquitous human 'longing for the eternal'. *Ga*, or the aesthetic of the high and the refined which seeks perfection of form in the flowering of ideals already in existence (in other words, tradition), reflects this impulse toward consummation, whereas *zoku*, or the impulse toward infinity, is characterized by a preoccupation with the low, the vulgar and the popular, embracing innovation freely and with energy. During much of Japan's cultural history, *ga* was associated with the legacy, direct and indirect, of Chinese aristocratic culture whereas *zoku* frequently was associated with indigenous notions emerging from the common people. For Konishi, *ga* and *zoku* function not merely as aesthetic ideals but ideological poles, which have been naturalized in the context of Japanese society and thought and whose dynamic interaction in different eras is evident in the forms of cultural production.

The novelist Tanizaki Jun'ichirō, in his essay 'In'ei Raisan' (In Praise of Shadows), also argues for a polarity, but in his case this polarity derives not so much from ideological differences within a society as from differences between Western art and Japanese art. In his wide-ranging analysis which discusses various arts from theatre to domestic architecture, with an especially appealing comparative section on bathrooms, he presents Western art as revolving around the worship of light and illumination, and Japanese art around darkness and obscurity as central metaphors. In many ways, what Tanizaki presents is an apology or defence of Japanese culture and art, suggesting that the very terms of Western approbation are inadequate for understanding Japanese notions of beauty. In doing so, he echoes the ideas of other commentators, such as Okakura Kakuzōwho in his *Ideals of the East* and *The Book of Tea* sought to define an aesthetic of Japan that stood aloof from Western paradigms.

Lest this be mistaken as a solely modern impulse to see the ethnic or national character embodied in cultural production, such as art and aesthetic theories, it is useful to recall Tsurayuki's Preface in which the very first words suggest his insistence on and preoccupation with Japanese poetry, attesting to what we might term 'the anxiety of influence' resulting from the penumbra cast by China's looming cultural shadows. We see this same preoccupation with Japanese art and its implications throughout *Genji Monogatari*, where China functions simultaneously as a yardstick and as that cultural monolith which must be transcended. Without a doubt, we see this same urge to identify artistic production with a peculiarly Japanese understanding of the world in the work of the *kokugakusha* of the eighteenth century, including Kamo no Mabuchi, whose work especially on the *Man'yōshū* asserts the centrality of indigenous thinking, and Motoori Norinaga, perhaps the greatest of all Japanese literary critics, who champions a Japanese artistic perspective that stands apart from Chinese notions of didacticism and morality, stressing both the intrinsic essence of things in the natural world as well as their effect on an observer.

One of the resulting tensions produced by these views is the paradoxical irony of asserting on the one hand the ubiquity of art and its universal nature as exemplified by Japanese art, while simultaneously arguing for its singular Japanese composition and tenor. We encounter this tension in the work of a number of modern

philosophers who were engaged by questions of aesthetics in the context of phenomenology and hermeneutics, including Kuki Shūzō (in *Iki no kōzō(The Structure of Iki)*) and Watsuji Tetsurō (in *Fūdo (Climate and Environment)*). Kuki saw in the Edo ideal of *iki* a configuration, not merely aesthetic or ideological, which quintessentially mapped out Japanese being along the continuum of possibilities. For Watsuji, whose work also pays homage to the thought of Martin Heidegger, the resolution of this irony depends on understanding all cultural production as emanating from a particular geographical context; in short, he argues that place is as key as time in understanding human being. In other words, we are shaped ineluctably by the land into which we are born and by our society, a view clearly in accord with those articulated in the early works of Japanese art.

Affirmative action

The term 'affirmative action' originated in the USA under President Kennedy. Originally it was designed to ensure that employees and applicants for jobs with government contractors did not suffer discrimination. Within a year, however, 'affirmative action' was used to refer to policies aimed at compensating African-Americans for unjust racial discrimination, and at improving their opportunities to gain employment. An important implication of this shift was that affirmative action came to mean preferential treatment.

Preferential treatment was later extended to include women as well as other disadvantaged racial and ethnic groups. The arguments in favour of preferential treatment can be usefully classified as backward-looking and forward-looking. Backward-looking arguments rely on the claim that preferential treatment of women and disadvantaged racial minorities compensates these groups or the members for the discrimination and injustices they have suffered. Forward-looking arguments rely on their claim that preferential treatment of women and disadvantaged racial minorities will help to bring about a better society.

There has been much criticism of both types of argument. The most common accusation is that preferential treatment is reverse discrimination. Other criticisms are based around who exactly should be compensated, by what means and to what extent, and at whose cost. Finally, there is the fear of the unknown consequences of such action. Arguments have been forwarded to try and solve such difficulties, but the future of preferential treatment seems to lie in a combination of the two arguments.

1 Backward-looking arguments

In the USA, Native Americans and African-Americans are the best examples of disadvantaged racial minorities that have been treated unjustly. One kind of backward-looking argument claims that the members of these groups suffer from ongoing racial discrimination practised by the white majority, and also from the effects of past injustices that the nation practised against their parents and ancestors; that they therefore deserve to be compensated; and that according them some preference over whites in the competition for jobs, promotions and places at universities is an appropriate way to give them the compensation they deserve. A second kind of backward-looking argument adds that preferential treatment of Native Americans and African-Americans is also a way to compensate the groups to which they belong. Both kinds of arguments are extended with somewhat diminished force to justify preferential treatment of women and other racial minorities that have been unjustly discriminated against.

2 Forward-looking arguments

Forward-looking arguments for preferential treatment do not require that preferentially treated individuals be themselves the victims of injustice. They justify treating some individuals preferentially if this will help make society more efficient, and more likely to give equal consideration to the common interests of its members. For example, preferential treatment of women in fields like engineering may make society more efficient by encouraging women with engineering talent to develop and use it. Similarly, preferential admission of African-Americans to medical school may help enable society if African-American doctors are more likely than white doctors to practise medicine in black ghettos where medical care is relatively scarce.

3 Criticisms of backward-looking arguments

The most general criticism of preferential treatment is that it is reverse discrimination. The implication is that preferential treatment is morally similar to the discrimination it is meant to compensate for. This implication is false. The discrimination preferential treatment is meant to compensate for is based on contempt for the interests or abilities of those discriminated against (see Discrimination). Preferential treatment is not based on such contempt. More specific criticisms of preferential treatment are directed at the backward-looking and forward-looking arguments.

Since backward-looking arguments for preferential treatment claim that it is required by compensatory justice, they presuppose a view of what compensatory justice requires. The most elementary requirement of compensatory justice is that those that deserve compensation must have been wrongly injured. Some critics of preferential

treatment object that it cannot be justified by compensatory justice because this is not usually the case. When directed against preferential treatment of African-Americans this objection is based on two grounds: an underestimation of the effects of racial discrimination and prejudice; and a false inference based on the fact that the black middle-class beneficiaries of preferential treatment are probably less injured than blacks in the lower and under classes to the conclusion that the former are only slightly injured or not injured at all.

A more serious question concerns who should bear the costs of compensating the beneficiaries of preferential treatment. A plausible view is that the costs of compensating the victims of wrongful injury should be borne by those responsible for the wrongful injury. Many critics object that even if practically everyone in the society is at least indirectly responsible for wrongly injuring the beneficiaries of preferential treatment, the policies implemented in its name usually seem to impose the heaviest costs on those least responsible. A similar objection can be raised if compensatory justice allows that the costs of compensating the victims of wrongful injury may have to be borne by the beneficiaries of the wrongful injury. The most troubling difficulty, however, is that we usually cannot know whether the beneficiaries of preferential treatment are getting the compensation they deserve. A plausible view of compensatory justice is that it requires that the wrongly injured persons be brought up to 'the level of wealth and welfare that they would now have if they had not been disadvantaged' (Nickel 1975: 536). On this account, beneficiaries are compensated presumably if compensatory justice secures them jobs and positions roughly similar to those they would have secured in the absence of injury. But preferential treatment does not obviously secure its beneficiaries the jobs and positions they would have recovered in the absense of injury. Consider, for example, the black beneficiaries of preferential treatment. If unjust racial discrimination had never happened, the conditions and prospects for blacks would be very different from what they are. For example, many more blacks, probably including the beneficiaries of preferential treatment, would be better qualified, and certainly many would be chosen for the jobs and places which preferential treatment secures. What is uncertain is that the black beneficiaries of preferential treatment would be the very ones chosen for these jobs and positions.

This difficulty is not insurmountable, but it has moved some advocates of backward-looking arguments of preferential treatment to stress that the larger aim is to compensate unjustly treated groups. On this account, it does not matter that the individuals who get jobs and places as a result of preferential treatment may not be the ones who would get these jobs and places in the absence of injustice directed at the groups they belong to. What matters is that their getting such jobs and places is a way to compensate these groups. This shift in the backward-looking argument raises a number of questions. Even if the typical beneficiaries of preferential treatment have been unjustly treated, it does not follow that the groups to which they belong are owed compensation; not every group of unjustly treated individuals need be owed compensation over and above the compensation owed the individuals that compose it. Indeed, not every group of unjustly treated individuals is the kind of group that can claim compensation. It is widely acknowledged that certain kinds of groups can claim compensation; nation states, firms and families are examples. But it is not obvious that the groups whose members benefit from typical programmes of preferential treatment are those kinds of groups. This difficulty can probably be resolved with respect to groups like African-Americans and Native Americans, groups that most resemble those that theorists acknowledge can meaningfully be owed compensation. Supposing this to be the case, this still leaves the difficulty of establishing the conditions that have to be satisfied to compensate such groups. Some theorists doubt that preferential treatment as standardly practised satisfies these conditions, given that it seems to contribute to the growing gap between the black middle-class and the black underclass (Wilson 1987). Presumably this objection can be met by redesigning present policies of preferential treatment. More general questions have been raised about the level of wealth and wellbeing preferentially treated groups would have to be brought to in order to be compensated. The assumption that this level is the level of flourishing groups in the society has been challenged on the ground that cultural differences between groups may explain most of the inequalities in their levels of wealth and wellbeing. However, even if this challenge is generally sound it does not defeat the claim that some preferentially treated groups deserve compensation.

4 Criticisms of forward-looking arguments

Forward-looking arguments do not have to resolve the difficult counterfactual problems that beset the backward-looking arguments. A common criticism of forward-looking arguments is that since they justify discriminating in favour of minorities and women when doing so maximizes utility, they must be committed to discriminating against women and minorities when doing so maximizes utility. This criticism is, however, largely

irrelevant because most advocates of the forward-looking arguments do not rely heavily on the supposition that preferential treatment maximizes utility; their more favoured supposition is that preferential treatment will enable society to give more equal consideration to the common interests of its members. The example given earlier concerning the treatment of women in fields such as engineering suggests the plausibility of this supposition. A frequent objection is that even if this supposition is plausible, preferential treatment is unjustified because it violates colour-blind or gender-blind principles. These principles forbid denying an individual a place, job or promotion on account of their colour or gender. They are plausibly implied by the equal opportunity principle, assuming that individuals have not previously been denied opportunities to acquire qualifications for places, jobs and promotions on account of their colour or gender. That assumption is false where preferential treatment is urged. However, although preferential treatment violates colour-blind and gender-blind principles it need not violate the equal opportunity principle. On the contrary it may help to implement that principle. For example, preferential admission of women in fields such as engineering may help society equalize opportunities by helping to break down stereotypes that falsely suggest that women cannot perform well in such fields. A deeper weakness of the objection is that it falsely assumes that the purpose of providing opportunities for places and jobs is to reward merit. In fact, the purpose of providing opportunities for places and jobs is to satisfy the needs and give equal consideration to the interests of members of the society. Meeting that purpose may require violating the colour-blind and gender-blind principles.

Further objections to the forward-looking arguments focus on the consequences of preferential treatment. One set of objections denies that it will have the good consequences its advocates predict. A crude example of this kind of objection is that we do not equalize the interests of the black poor in medical treatment by certifying unqualified blacks as doctors to treat them. A more serious objection denies that there is any good reason to suppose that black doctors are more likely than white doctors to work among the black poor. Another set of objections maintain that preferential treatment is likely to have some untoward consequences. Favourite arguments are that it will create the stereotype that women and minorities cannot succeed in competition with white males without special help, and that it will undermine the self-esteem and self-respect of those it sets out to benefit. These dangers seem most likely where the beneficiaries of preferential treatment misunderstand its rationale.

5 Conclusion

The case for preferential treatment remains highly controversial. Philosophers disagree about what its consequences are likely to be, and about who has been injured enough to deserve it. More importantly, they also disagree about the requirements of compensatory justice, the demands of equality and the nature of the good society. The case for preferential treatment of such groups can only be strengthened by grounding it explicitly on well-argued answers to these philosophical questions.

African philosophy

In order to indicate the range of some of the kinds of material that must be included in a discussion of philosophy in Africa, it is as well to begin by recalling some of the history of Western philosophy. It is something of an irony that Socrates, the first major philosopher in the Western tradition, is known to us entirely for oral arguments imputed to him by his student Plato. For the Western philosophical tradition is, above all else, a tradition of texts. While there are some important ancient philosophers, like Socrates, who are largely known to us through the reports of others, the tradition has developed increasingly as one which pays careful attention to written arguments. However, many of those arguments - in ethics and politics, metaphysics and epistemology, aesthetics and the whole host of other major subdivisions of the subject - concern questions about which many people in many cultures have talked and many, although substantially fewer, have written outside of the broad tradition of Western philosophy. The result is that while those methods of philosophy that have developed in the West through thoughtful analysis of texts are not found everywhere, we are likely to find in every human culture opinions about some of the major questions of Western philosophy. On these important questions there have been discussions in most cultures since the earliest human societies. These constitute what has sometimes been called a ‘folk-philosophy’. It is hard to say much about those opinions and discussions in places where they have not been written down. However, we are able to find some evidence of the character of these views in such areas as parts of sub-Saharan Africa where writing was introduced into oral cultures over the last few centuries.

As a result, discussions of African philosophy should include both material on some oral cultures and rather more on the philosophical work that has been done in literate traditions on the African continent, including those that have developed since the introduction of Western philosophical training there.

1 Oral cultures

Two areas of folk-philosophy have been the object of extended scholarly investigation in the late twentieth century: the philosophical psychology of people who speak the Akan languages of the west African littoral (now Ghana) (see Akan philosophical psychology) and the epistemological thought of Yoruba-speaking people of western Nigeria (see Yoruba epistemology). In both cases the folk ideas of the tradition have been addressed by contemporary speakers of the language with Western philosophical training. This is probably the most philosophically sophisticated work that has been carried out in the general field of the philosophical study of folk-philosophy in Africa. It also offers some insight into ways of thinking about both the mind and human cognition that are different from those that are most familiar within the Western tradition.

One can also learn a great deal by looking more generally at ethical and aesthetic thought, since in all parts of the continent, philosophical issues concerning evaluation were discussed and views developed before writing (see Aesthetics, African; Ethical systems, African). Philosophical work on ethics is more developed than in aesthetics and some of the most interesting recent work in African aesthetics also focuses on Yoruba concepts which have been explored in some detail by Western philosophers. The discussion of the status of such work has largely proceeded under the rubric of the debate about ethnophilosophy, a term intended to cover philosophical work that aims to explore folk philosophies in a systematic manner (see Ethnophilosophy, African). Finally, there has also been an important philosophical debate about the character of traditional religious thought in Africa (see African traditional religions).

2 Older literate traditions

Although these oral traditions represent old forms of thought, the actual traditions under discussion are not as old as the remaining African literate traditions. The earliest of these is in the writings associated with the ancient civilizations of Egypt, which substantially predate the pre-Socratic philosophers who inhabit the earliest official history of Western philosophy (see Egyptian cosmology, ancient). The relationship between these Egyptian traditions and the beginnings of Western philosophy have been in some dispute and there is much recent scholarship on the influence of Egyptian on classical Greek thought (see Egyptian philosophy: influence on ancient Greek thought).

Later African philosophy looks more familiar to those who have studied the conventional history of Western

philosophy: the literate traditions of Ethiopia, for example, which can be seen in the context of a long (if modest) tradition of philosophical writing in the horn of Africa. The high point of such writing has been the work of the seventeenth-century philosopher, Zar'a Ya'ecob. His work has been compared to that of Descartes (see Ethiopia, philosophy in).

It is also worth observing that many of the traditions of Islamic philosophy were either the product of, or were subject to the influence of scholars born or working in the African continent in centres of learning such as Cairo and Timbuktu (see Islamic philosophy). Similarly, the work of some of the most important philosophers among the Christian Church Fathers, was the product of scholars born in Africa, like St Augustine, and some was written in the African provinces of Rome.

In considering African-born philosophers, there is Anton Wilhelm Amo, who was born in what is now Ghana and received, as the result of an extraordinary sequence of events, philosophical training during the period of German Enlightenment, before returning to the Guinea coast to die in the place he was born. Amo's considerable intellectual achievements played an important part in eighteenth- and nineteenth-century polemics relating to the 'capacity of the negro'. Unfortunately, only a portion of his work has survived.

3 Recent philosophy

Most work in African philosophy in the twentieth century has been carried out by African intellectuals (often interacting with scholars outside Africa) under the influence of philosophical traditions from the European countries that colonized Africa and created her modern system of education. As the colonial systems of education were different, it is helpful to think of this work as belonging to two broadly differentiated traditions, one Francophone and the other Anglophone. While it is true that philosophers in the areas influenced by French (and Francophone Belgian) colonization developed separately from those areas under British colonial control, a comparison of their work reveals that there has been a substantial cross-flow between them (as there generally has been between philosophy in the French- and English-speaking worlds). The other important colonial power in Africa was Portugal whose commitment to colonial education was less developed. The sole Portuguese-speaking African intellectual who made a significant philosophical contribution is Amílcar Cabral, whose leadership in the independence movement of Guinea Bissau and the Cape Verde islands was guided by philosophical training influenced by Portuguese Marxism. Cabral's influence has not been as great as that of Frantz Fanon. He was born in the French Antilles, but later became an Algerian. He was a very important figure in the development of political philosophy in Africa (and much of the Third World).

Among the most important political thinkers influenced by philosophy are Kwame Nkrumah, Kenneth Kaunda and Julius Nyerere (see African philosophy, Anglophone). Out of all the intellectual movements in Africa in this century, the two most important ones of philosophical interest have been *négritude* and pan-Africanism (see African philosophy, Francophone; Pan-Africanism).

Philosophy in Africa has changed greatly in the decades since the Second World War and, even more, as African states have gained their independence. Given the significance of the colonial legacy in shaping modern philosophical education in Africa it is not surprising that there have been serious debates about the proper understanding of what it is for a philosophy to be African. These lively debates, prevalent in the areas of African epistemology, ethics and aesthetics, are found in both Francophone and Anglophone philosophy (see Aesthetics, African).

African philosophy, Anglophone

Contemporary African philosophy is in a state of flux, but the flow is not without some watersheds. The chief reason for the flux lies in the fact that Africa, in most part, is in a state of transition from a traditional condition to a modernized one. Philosophically and in other ways, the achievement of independence was the most significant landmark in this transition. Independence from European rule (which began in Libya in 1951, followed by Sudan in 1956, Ghana in 1957 and continued to be won at a rapid pace in other parts of Africa in the 1960s) did not come without a struggle. That struggle was, of necessity, both political and cultural. Colonialism involved not only political subjection but also cultural depersonalization. Accordingly, at independence it was strongly felt that plans for political and economic reconstruction should reflect the needs not only for modernization but also for cultural regeneration. These are desiderata which, while not incompatible in principle, are difficult to harmonize in practice. The philosophical basis of the project had first to be worked out and this was attempted by the first wave of post-independence leaders. The task of devising technical philosophies cognizant of Africa's past and present and oriented to her long-term future has been in the hands of a crop of professional philosophers trained in Western-style educational institutions. Philosophical results have not been as dramatic as in the case of the political, but the process is ongoing.

The political figures that led African states to independence were not all philosophers by original inclination or training. To start with only the best known, such as Leopold Senghor of Senegal, or Kwame Nkrumah of Ghana, were trained philosophers, but others, such as Kenneth Kaunda of Zambia, brought only an educated intelligence and a good sense of their national situations to the enterprise. In all cases they were rulers enthusiastically anointed by their people to chart the new course and lead them to the promised land. An example of how practical urgency can inspire philosophical productivity can be found in the way that all these philosophers propounded blueprints for reconstruction with clearly articulated philosophical underpinnings. Circumstantial necessity, then, rather than Platonic selection made these leaders philosopher-kings. It is significant, also, to note that all the leaders mentioned (and the majority of their peers) argued for a system of socialism deriving from their understandings of African traditional thought and practice, and from their perceptions of the imperatives generated by industrialization, such as it had been. Concern with this latter aspect of the situation led to some flirtation and even outright marriage with Marxism. But, according to the leaders concerned, the outcome of this fertilization of thought had enough African input to be regarded as an African progeny. Accordingly, practically all of them proffered their theories and prescriptions under the rubric of African socialism. No such labelling is possible in the work of African philosophers, but there are some patterns of preoccupation.

1 The epistemological anthropology of *négritude*

Of all the African leaders under study, Senghor, poet and man of letters, is perhaps the most learned and most remarkable in his views. He is also the most famous champion of *négritude*. This term refers to both a literary movement and its defining outlook. *Négritude* was focused on restoring in black people the pride in their being and culture that had been eclipsed by colonization. The pioneer of *négritude* was Aimé Césaire, the black poet and playwright from Martinique. In the hands of Senghor, *négritude* also became a kind of epistemological anthropology and a political philosophy.

According to Senghor, *négritude* designates 'the whole complex of civilized values - cultural, economic, social and political which characterize the black peoples or, more precisely, the Negro-African world' (Mutiso and Rohio 1975: 83). The character of these values emerges at the social, and more fundamentally, epistemological levels. Socially, the key to these values was held to consist in what Senghor calls the 'communal' characteristic of African society. Countries exhibiting that kind of social formation are ones in which 'the group takes precedence over the individual'; they are 'above all, religious countries where money is not king' (Senghor 1965: 58). Senghor stresses the importance of the institution of the family, which he says is the 'microcosm' of this kind of society. As he points out, 'family' in this context has to be understood in a non-Western sense as referring to a kinship unit including 'all persons, living and dead, who acknowledge a common ancestor' (1965: 48). Senghor suggests that this unit is better called a clan following anthropological usage. In a typical traditional village or town it would be more numerous and at the level of a nation, innumerable. In its smallest proportions, then, a 'family' in this sense is a substantial community and provides, as the immediate context of early socialization, a natural school for the

cultivation of a broad sense of social belonging and obligation. ‘The African’, says Senghor, ‘is thus held in a tight network of vertical and horizontal communities which bind and at the same time support him’ (1965: 43). More significantly, Senghor adds, ‘ He is the fullest illustration of the truth, honored in our time by socialism, that man can only live and realise himself in and through society’ (1965: 43).

However, Senghor does not suggest that Africans devalue individuality: the African ‘claims his autonomy… to affirm himself as a being’ (1964: 94). But, the logical point to be noted here is that in the African scheme of things individuality is defined in terms of community, not vice versa. In consequence, the African approach to self-consciousness is non-Cartesian. Instead of ‘I think, therefore I am’, he or she, according to Senghor, would say (dispensing with ‘the logician’s conjunction "therefore"’ as a mere distraction), ‘I feel, I dance the Other; I am’ (1964: 73). This axiom of communalist self-consciousness became even better known about a decade later in Mbiti’s formulation as ‘I am because we are, and since we are, therefore I am’ ([1969] 1990: 106). However, Senghor’s epistemological reading of this mode of self-affirmation remains uniquely his own. To him it was typical of the ‘emotive’ and ‘participatory’ character of African cognition, which he considered to be in marked contrast with Western ways of knowing. He wrote:

> Let us consider the negro-African as he faces the object to be known, as he faces the Other: God, man, animal, tree or pebble, natural or social phenomenon. In contrast to the classic European, the African negro does not draw a line between himself and the object; he does not hold it at a distance, nor does he merely look at it and analyse it. More exactly, after having held it at a distance, after having scanned it without analysing it, he takes it vibrant in his hands, careful not to kill or fix it. He touches it, feels it, smells it … Thus the negro African sympathises, abandons his personality to become identified with the other.
>
> (Senghor 1964: 72)

Senghor actually maintained that these ‘modes of knowledge’ or ‘forms of thought (are) different and linked to the psycho-physiology of each race’ (1965: 33).

Senghor attached great importance to this account of African cognition because he thought that it explained ‘the cultural values of the Africans… their religion and social structure, their art and literature, above all the genius of their languages’ (1965: 35). Thus the communalist cast of African society is a social manifestation of the sense of community which the African feels with the whole of creation. This manifestation traditionally took the form of social arrangements of mutual caring and support which ensured for the individual a reasonable amount of wellbeing. A key feature of this system was the combined individual and clan ownership of the means of production (mainly land) and the products of labour, which, in the opinion of Senghor, made African society ‘collectivist’ or ‘socialist’. To Senghor, the task facing contemporary African political thought was how to capture this pristine socialism in modern social and political institutions. In the event he found little rationale for extensive nationalization, and his prescriptions and their implementation were only remotely analogous to socialism customarily understood.

From a philosophical point of view the most interesting questions relate to Senghor’s theory of ‘forms of thought’. Recalling his claim that: ‘European reasoning is analytical, discursive by utilization; African reasoning is intuitive by participation’ (1964: 73), the following questions may be asked: Do these characterizations represent distinctive cognitive categories? Are they, can they be, physiologically ingrained? And is the racial apportionment justified? In response to outcries from some African intellectuals scandalized by this apparent attribution of a constitutional incapacity for analysis to the African psyche, Senghor, notwithstanding protestations to the contrary, changed his position substantially: ‘In truth every ethnic group possesses, along with different aspects of Reason, all the virtues of man, but each has stressed only one aspect of Reason, only certain virtues’ (1964: 75). He even called for the integration of cognitive methods.

A striking feature of Senghor’s discussions of the philosophical bases of his ideological recommendations is his frequent grappling with Marxism. He is highly impressed by the intellectual power of Marx and much taken with Marx’s dialectical method, which he somehow believed was in harmony with African ways of thinking: ‘Negro African reason is traditionally dialectical, transcending the principles of identity, non-contradiction and the "excluded middle"’ (1964: 75). But there is a pronounced ambivalence with regard to certain elements of the Marxist construct. These were the materialistic aspect of dialectical materialism, its atheism and what he perceived to be its determinism, all of which, in themselves, he regarded as objectionable and incompatible with the

traditional African worldview. Moreover, he did not think that the class struggle was a necessary factor in the African quest for a contemporary form of socialism.

2 Metaphysics and African socialism

These rejections of Marxist materialism, atheism and determinism generally came to be taken as the marks by which to distinguish the philosophy of African socialism from the Marxist variety. However, these marks of distinction were not always applicable. For example, the philosophy of Kwame Nkrumah of Ghana, the major architect of Africa's victories in her anti-colonial struggles of this century, was an eminent counterexample in at least two respects. First, although Nkrumah was not an atheist, materialism appealed to him. Second, although he was not initially enthusiastic about the necessity for a class struggle in Africa, he later changed his mind. These differences are symptomatic of a deeper difference in philosophical outlook and ideological commitment. Senghor's appreciation of Marx was theoretical rather than ideological. Nkrumah's, on the other hand, was far-reaching in both its theoretical and ideological aspects. Furthermore, Nkrumah had an emphatically neo-Marxist notion, not apparent in Senghor, of the intimate relationship of abstract philosophy with political practice. This is seen in his book *Consciencism: Philosophy and Ideology for De-Colonization* ([1964] 1970) in assertions like 'Idealism favours an oligarchy, materialism favours an egalitarianism' ([1964] 1970: 75), which illustrate the predominant tendency of the interpretations of the history of Western philosophy with which he prefaced his ideological affirmations. But by far the most philosophically interesting difference between the two philosopher-kings is the fact that, while Senghor believed that materialism (dialectical or otherwise) was incompatible with religion, Nkrumah did not (see Dialectical materialism).

Thus, very early in his life as an anti-colonial leader in Ghana Nkrumah proclaimed in a public lecture, 'I am a Marxist Socialist and a nondenominational Christian, and I see no contradiction in this'. In view of his claims of African authenticity for his theory, he also might have added, 'Moreover, I believe in the essentials of the African traditional worldview, and I see no contradiction in this either'. The way in which he defended his belief that the dialectical materialism of Marxism is consistent with the theism of Christianity and the metaphysics of the traditional African worldview was to deploy an ingenious distinction between materialism as the theory of the *sole* reality of matter and the *primary* reality of matter. In Nkrumah's view, the first variety of materialism is injudicious as it conflicts with both fact of mind and the spiritual aspects of human experience. On the other hand, a materialism of the second persuasion can accommodate these previously recalcitrant facts, provided it has an intelligible and valid account of the emergence of mind from matter. Dialectical materialism is, according to Nkrumah, of the second type and he invented for it just such an account: 'The key to the solution of the problem', he explained, 'lies in categorial convertibility' ([1964] 1970: 20). Categorial conversion was defined not by direct specification, but almost recursively, by cases: 'By categorial conversion, I mean such a thing as the emergence of self-consciousness from that which is not self-conscious: such a thing as the emergence of mind from matter, of quality from quantity' ([1964] 1970: 20). As an aid to the understanding of these category transitions, *Consciencism: Philosophy and Ideology for De-Colonization* says that philosophy turns to science for 'models' and discovers exemplars in 'the inter-reducibility of matter and energy' and in chemical change wherein 'physical quantities give rise to emergent qualities' ([1964] 1970: 21).

For further enlightenment as to the nature of categorial conversion, the reader was directed to the following explanatory comparison: 'The average man belongs to a category distinct from that of the men and women of flesh and blood; but the concept of the average man is obtained by a certain conceptual conversion of information about individual men and women' ([1964] 1970: 22). Here the category of 'living men and women' is primary and that of the average man derivative. Similarly, from the primary category of matter we can arrive at the derivative category of mind by a logical processing of data about 'nervous' matter. Propositions about the mind are then seen to be 'materially equivalent' to propositions about 'a critical organization of matter'. In this way the categorial differences are revealed as *façons de parler*.

The problems afflicting this account are difficult to minimize. For example, in so far as the average-man illustration is germane, the convertibility involved is a logical relationship. Consequently, phenomena such as the emergence of chemical properties from 'physical quantities' held up as a model must fall beyond the pale of categorial conversion. More gravely, the objective of reconciling dialectical materialism with Christianity, however nondenominational, must entail conceiving of the eternal, supreme, spiritual being of that religion as a

kind of emergence from matter, which would mean reconceiving that being out of all recognition. Consistency, then, cannot be achieved. However, given Nkrumah's faith in categorial conversion, it is easy to understand this problematic catholicity on his part. The same faith in the idea of categorial convertibility, which he held was to be found among African traditional conceptions, enabled him to combine Marxist materialism with his background in African thought. That some very transformative 'conversion' was necessary is apparent from the fact that he believed that 'man is regarded in Africa as primarily a spiritual being' ([1964] 1970: 68).

This African connection was as important to Nkrumah as it was to Senghor. To Nkrumah it showed that his appropriation of the Marxist philosophy (and in general his explorations of Western philosophy), did not compromise his African authenticity. With the attainment of independence, Nkrumah felt there was need to articulate a philosophy that could harmonize the competing segments that have come to inhabit the African conscience through historical circumstances. These segments derived from the presence in contemporary Africa of influences from African traditional culture and from Islamic and Euro-Christian sources. The synthesis of Marxist philosophy with some Christian and African traditional conceptions, which Nkrumah called philosophical consciencism, was he said, exactly such a philosophy.

Nkrumah gave the following indications of the traditional African ingredients in this philosophical compound: philosophical consciencism 'agrees with the traditional African idea of the absolute and independent existence of matter, the idea of its powers of self-motion… the idea of categorial convertibility, and the idea of the grounding of… ethics in the nature of man' ([1964] 1970: 97). Also, as far as socialism is concerned, 'the traditional face of Africa includes an attitude towards man which can only be described, in its social manifestations, as being socialist' ([1964] 1970: 68). The implied reference is to the communalism of traditional Africa, which according to *Consciencism: Philosophy and Ideology for De-Colonization*, is 'the sociopolitical ancestor of socialism' ([1964] 1970: 73). On the question of the socialistic complexion of traditional communalism Nkrumah and Senghor are at one. They are also in agreement with Julius Nyerere of Tanzania, one of the most respected of Africa's statesman-thinkers. However, they differ with Nyerere in other ways. Both Senghor and Nkrumah seem to make a veritable conceptual linkage between their metaphysics and their socialist ideology. This is not true of Nyerere: 'There is not the slightest necessity for people to study metaphysics and decide whether there is one God or many Gods or no God before they can be socialists. These questions are important to man, but irrelevant to socialism' (1969: 39).

3 An analysis of socialism and a reflection on violence

There is an absence of metaphysical learning in Nyerere's pages. However, the reader does find a highly philosophical approach to the socialist ideology based on an analysis of the traditional communalism of his society and its contemporary condition. Nyerere traces the idea of socialism to its foundation, which he finds in the principle of equality. 'Socialism', he says, 'is, in fact, the application of the principle of human equality to the social, economic and political organization of society' (1968: 79). Broadly construed, this is an equality of benefits. Consequently, for Nyerere, socialism is a distributive dispensation and not primarily a system of production. But he concedes that certain forms of production can lead to the unequal acquisition of wealth on a scale which makes it possible for some people to gain exploitative dominance over others. Therefore a rationally selective public ownership of the means of production can become a means for achieving the basic aim of socialism. However, social ownership ought to be distinguished from social control as the former can be combined with all kinds of despotisms, while the latter, if genuine, cannot. Furthermore, the latter can conceivably be had without the former. Hence, what socialism requires is the social control of certain means of production. This has important political implications. Social control is not conducive to socialism (as the social embodiment of human equality) unless it is exercised by a citizenry enjoying equality of freedom and participation. Therefore, 'Democracy is another essential characteristic of a socialist society', and the rule of law is a part of it: 'until it prevails socialism does not prevail' (1969: 31, 34). Besides, a socialist society in Nyerere's view must be suffused with an ethos of cooperativeness as opposed to personal competitiveness.

There have been expositions of social and political testaments with significant philosophical components by other African political leaders, such as Sekou Touré of Guinea, Obafemi Awolowo of Nigeria, Felix Houphouët-Boigny of the Ivory Coast, Kenneth Kaunda of Zambia and Amílcar Cabral of Guinea-Bissau. They all, except Houphouët-Boigny, advocated varieties of socialism, but none surpassed the conceptual clarity of Nyerere.

Without exception, however, all the socialisms have come under a cloud on account of the uniform failure of the socialist experiments in Africa and elsewhere. Their philosophical components, nevertheless, challenge a properly philosophical evaluation.

Worthy of special mention in connection with the literature produced by Africa's statesman-philosophers is Kaunda's book of meditations on the theme of violence (*Kaunda on Violence* (1980)). The question of the moral legitimacy of violence in the liberation struggles of Africa was the cause of much earnest soul-searching among sensitive people in Africa (Mazrui (1978), Wiredu (1986), Serequeberhan (1991)). The book by Kaunda is an agonized philosophical soliloquy on his personal evolution from an adherent of Gandhian nonviolence to a principal supporter and sustainer of the armed struggle in southern Africa. His considered judgment, after extended reflections articulated with singular lucidity, is that violence is never justifiable morally, but it may be forgiven (by the Lord Almighty) if it is in reaction to the violence of an oppressor. This thoughtful conclusion raises quite subtle issues in moral philosophy of relevance in Africa and everywhere else. But in Africa it also provides a reasoned contrast to the relatively untroubled advocacy of anti-colonial violence in Fanon's *The Wretched of the Earth* (1961), a book which deservedly has a considerable African following (see Fanon, F.).

4 The question of African philosophy in our time

If the challenges of independence provided the direct stimuli of the philosophical enterprises of Africa's political leaders, they also provide the indirect cause of the character and present state of academic philosophy in Africa. This brings us to our second watershed. Pre-independence curricula in philosophy in African universities in the British colonial orbit were unmodified importations from the UK, not to say impositions, without any African admixtures. If mention was made of any African philosophical conception bordering on the philosophical inside those universities, it was likely to emanate from a department of anthropology or religion. Naturally, not long after independence, the general movement towards the reclamation of the African identity made itself felt in philosophy departments in the form of a search for an African orientation in teaching and research in philosophy. Two of the subprojects that have received some attention in the pursuit of this objective are the study of the philosophical ideas embedded in African oral traditions and the utilization of insights from that study in combination with insights from other sources in the contemporary world for the construction of philosophies for modern existence.

To take the first project first: although its necessity is widely recognized, its modalities are enveloped in deepest controversy. Debate has raged principally around the criticisms by Paulin Hountondji (1983) of contemporary studies of traditional African thought that construe it as a continental monolith of philosophical unanimity. Hountondji, the Francophone African philosopher who has most influenced contemporary philosophical discussions in Anglophone Africa, has used the term 'ethnophilosophy' to designate studies of this kind, which he regards not as nonphilosophy (as it is sometimes supposed), but rather as bad philosophy. They are apt, he says, to be 'the description of an implicit, unexpressed worldview, which never existed anywhere but in the anthropologist's imagination' (1983: 63). Among the works Hountondji places in this category are *Bantu Philosophy* (1959) by Placide Tempels, a Belgian missionary and *African Religions and Philosophy* (1969) by John Mbiti, an African theologian. African traditional thought itself, however, according to Hountondji, 'possesses a complexity, a richness and a depth with which we have as yet scant acquaintance, and which we must now recover' (1983: 280). Nevertheless, not being articulated in the form of explicit and systematic expositions, traditional African thought cannot be said to contain the discipline of philosophy, even though its ancestral originators may have been philosophers in their own right. At best, we 'can probably recover philosophical fragments from our oral literature' (1976: 106-7), but the forging of a discipline from this material worthy of the name of philosophy remains a challenge to contemporary Africans that can only be met in close alliance with the quest for scientific knowledge (see Ethnophilosophy, African).

These sentiments have fallen harshly on the sensibilities of the traditionalists among contemporary African philosophers, and the ensuing controversy has seemed interminable to both onlookers and some insiders (Serequeberhan (1991) is an excellent sampling of the exchanges). Nevertheless, some significant work has been done because of that controversy and alongside it, although it is somewhat scattered. Among the most accessible of such work are Gyekye (1987) and Gbadegesin (1991). These books contain detailed interpretative expositions of African traditional philosophy, focusing on the Akan of Ghana and the Yoruba of Nigeria respectively. Both philosophers find in their traditional heritage dualistic but richly stratified conceptions of human personality. They

also find, like the philosopher-kings before them, a communalistic ethic and, contrary to a longstanding orthodoxy, a rationalistic, rather than a supernaturalistic ethics. In philosophical theology they call attention to unaided indigenous postulations of a supreme being, although in Gyekye's interpretation, but not in Gbadegesin's, the conception is substantially similar to the God of Christianity. In either case, their interpretations stand in contrast to the account of Luo traditional religion advanced by Okot P'Bitek, the Ugandan poet, novelist and philosopher, in an earlier phase of contemporary African philosophy. In two books of notable conceptual sophistication, *African Religions in Western Scholarship* (1970) and *Religion of the Central Luo* (1971), P'Bitek argued that the conceptual framework of the Luo has no place for the notion of a supreme being or even for the beginning of the world and that the widely received notions of a Luo supreme being are only thanks to a Western missionary superimposition.

Whatever the truth in this matter, it cannot be doubted that the years of Western leadership in the literature on African thought have left encrustations on indigenous conceptual structures that are due for systematic unscrambling. It is arguable, for example, that the dualistic conception of body and mind, which is often attributed to Africans, in fact, presupposes a mode of conceptualization that ill-coheres with African traditional thought habits, which are frequently empirical, as distinct from empiricist (see Akan philosophical psychology). This suggests a need for conceptual decolonization which, although not in itself a touchstone of philosophical truth, is a necessary preliminary to the accomplishment of the historic tasks facing contemporary African philosophy.

5 Typology of current trends

In addition to traditional thought there have been other objects of attention. In his now famous typology of trends in contemporary African philosophy, the Kenyan philosopher Odera Oruka (1990) discriminates four trends which he lists as (1) ethnophilosophy, (2) philosophic sagacity, (3) nationalist-ideological philosophy and (4) professional philosophy. Subsequently in *Sage Philosophy* (1991) he increased the number to six, adding 'hermeneutic philosophy and artistic or literary philosophy'. By 'artistic and literary philosophy' Oruka means not only the explicit philosophical reflections volunteered from time to time by the creative spirits of contemporary Africa, such as in Wole Soyinka's *Myth, Literature and the African World* (1976), but also the philosophies implicit in their poems, plays, novels and other artistic productions. Oruka's act of inclusion betokens a strong sense of the value of intensive interaction between professional philosophy, on the one hand, and art and literature, on the other, a source of intellectual riches in other traditions.

According to Oruka's scheme of classification the work of the statesman-thinkers falls under nationalist-ideological philosophy while the studies of traditional thought may be said to fall under ethnophilosophy, provided this term is divested of any pejorative connotations. But ethnophilosophy is also generally part of the work of the professionals. The same is true of what Oruka calls 'hermeneutical philosophy'. This he defines as consisting of 'philosophical analysis of concepts in a given African language to help clarify meaning and logical implications' (1990: 11). In illustration of the 'hermeneutical category' he cites Gyekye's *An Essay on African Philosophical Thought* (1987), Wiredu's 'The Concept of Mind with Particular Reference to the Language and Thought of the Akans' (1987) and Hallen's and Sodipo's *Knowledge, Belief and Witchcraft: Analytic Experiments in African Philosophy* (1986).

Of special interest is Gyekye's chapter on 'Philosophy, Logic and the Akan Language'. Disavowing any a priori relativization of philosophical theses to particular languages, Gyekye points out how travel across languages can affect the fate of a philosophical thesis or problem. In one of his examples, he argues that in Akan (the language of one of the ethnic groups of Ghana), the expression *wōhō*, by means of which the concept of existence may be translated, has an irreducibly locative component, carried by the particle *hō*, which means 'at some place'. Given this conceptual situation, he explains, something like St Anselm's ontological argument for the existence of God would be unlikely to enjoy an appearance of plausibility in Akan philosophical discourse. Nor could the controversy, historically precipitated by the Saint's argumentation as to whether existence is a predicate, tempt Akan curiosity, for in Akan terms, the question would reduce to 'something like "Is that something is there an attribute?"', which is 'bizarre' (1987: 179-81) (see Existence). In a similar vein, Kwasi Wiredu in his article, 'The Concept of Mind with Particular Reference to the Language and Thought of the Akans' (1987) argued the point that any conception of mind as some kind of an entity must jar severely on the conceptual framework embedded in Akan thought and talk about things mental. There is no unanimity among contemporary Akan philosophers on

these interpretations, but in matters philosophical this should catch no one by surprise. Furthermore, in neither case are the conceptual disparities revealed taken as proof of philosophical wisdom or its opposite. What they might establish is that certain ways of thought and puzzlement entrenched in Western philosophy are not humanly ineluctable. While it would be premature to invest this reflection with a relativistic significance, the need for a serious examination of relativism is certainly collateral to these types of inquiries.

The book by Hallen and Sodipo (1986) represents something of a methodological innovation in contemporary research in African philosophy (see Yoruba epistemology). The two academic philosophers sought the expertise of a class of Nigerian traditional healers (known as *onisegun*) recognized for their mastery of Yoruba thought and language, by interacting with them on terms of respectful collegiality. They regarded the *onisegun* not as informants, as was customary in academic research, but as fellow philosophers and held long discussions with them on the semantics of certain philosophically-sensitive Yoruba concepts. They then drew upon the results, which they published in faithful transcription, to make comparisons with approximate conceptual counterparts in English. They discovered that the approximations in every case had a significant roughness at their philosophical edges. The best analogy of the knowledge-belief distinction in the Yoruba language is that between *mò* and *gbàgbó*. But *mò* exacts more stringent conditions than knowledge, as the following observation by Hallen and Sodipo indicates:

> *Gbàgbó* that may be verified is *gbàgbó* that may become *mò*. *Gbàgbó* that is not open to verification (testing) and must therefore be evaluated on the basis of justification (*àlàyé*, *papò*, etc.) cannot become *mò* and consequently its *òótó* [truth] must remain indeterminate.
>
> (Hallen and Sodipo 1986: 81)

The contrast with well-known analyses of knowledge in English-speaking philosophy is so striking that Hallen and Sodipo are moved to conclude that ‘propositional attitudes are not universal’. As a brief illustration of one implication of the contrast, it is important to consider the following. In contemporary Anglo-American philosophy it is generally agreed that s knows that p if and only if p is true, s believes that p and s is justified in believing that p under some Gettier-chastened condition(s) (see Justification, epistemic §3). But, however chastened, the justification condition must be too weak for the Yoruba *mò*, since it requires, as is clear from the context, a first-person experiential verification. More interestingly, the belief condition does not survive a Yoruba conversion either. If a person is acknowledged to *mò* p, then to say that they *gbàgbó* p is not just an understatement, but a self-contradictory misstatement, for the use of *gbàgbó* implies that *mò* is unattained. Thus, though *gbàgbó* may ascend to *mò*, the transformation is qualitative and *mò* at the cognitive apex categorially scorns the base degrees by which it did ascend (with apologies to Shakespeare). All this is, of course, on the assumption that Hallen and Sodipo are right in their interpretation, quoted above, of what the *onisegun* say and furthermore that the *onisegun* are right in their account of the conceptual situation in the African vernacular. Without mentioning the complications introduced by the comparative dimension, this already suggests the multifaceted character of the problem of evaluating all ‘hermeneutical studies’ that have a transcultural effect. Nevertheless, the importance of such investigations in contemporary African philosophy can hardly be exaggerated.

6 Indigenous African philosophers

Equally important are investigations into what Oruka calls ‘philosophic sagacity’ or, better, ‘sage philosophy’. Oruka himself is responsible for the path-breaking publication in this area of research. In his *Sage Philosophy* (1991) he gives extensive exposure to the philosophical views of indigenous thinkers in contemporary Kenyan society practically uninfluenced by Western ideas. Particularly noteworthy about their thinking is the fact that they are aware of the traditional thought of their community, but not overawed by it. They put forward their views, like most philosophic thinkers, as their own, not as the community’s. In this they differ from Hallen and Sodipo’s *onisegun*. Although those indigenous experts on Yoruba thought may be bright philosophers, they prefer to throw light on the Yoruba conceptual framework rather than on their own in a personal sense. They abjure intellectual individualism, going as far as to forbid the mention of their names in the published text. Both types of thinkers are known in African society.

To return to Oruka’s philosophic sages: in sketches of their philosophical positions in response to their academic interlocutors, they express with force and lucidity a variety of views on many subjects, including God, religion,

witchcraft, body and mind, virtue, good and evil, truth and falsehood, happiness, life and death, justice, equality, freedom, law, crime, punishment, human suffering, man and woman, ethnicity, and communalism. Perhaps the most intriguing variation of views is to be found in their conceptions of God. Sage Akoko maintains that the nature of God in unknowable, but his existence can be inferred from the uniformity of nature (1991: 37). Chaungo, on the other hand, is convinced that God is the sun. It 'heats the land all day, and its absence cools the land all night. It dries things: plants use it to grow. Surely, it must be the God we talk about' (1991: 115-6). To Kithanje, God is of the nature of a process rather than of an object. His thought about God revolves round 'the mixture of heat and cold'. When these merge 'there comes life… The act of fusion which brings forth life is what we call God. And that is what we mean when we say that God created the universe' (1991: 134). For his part, Oruka Rang'inya contends that it is wrong to personalize God. He is simply 'an idea, the idea which represents goodness itself' (1991: 119). With Njeru wa Kinyenje, outright atheism is finally reached: 'Both religion and witchcraft… have no truths in them' (1991: 38).

In the literature of African thought south of the Sahara such philosophic individuality has, by a long-standing mistake, rarely been ascribed to individual Africans in traditional life. M. Griaule's *Conversations with Ogotemmeli* (1965) is an apparent exception. Ogotemmeli, a Dogon sage from the west African nation of Mali, is clearly shown to be an individual of outstanding speculative abilities. But the intricate web of thought he weaves belongs to his ethnic group, not to him personally. However, since communal thought is a kind of pooling together of the thought of individual thinkers, the Ogotemmeli phenomenon should have given pause to those who were tempted to suppose that traditional Africa was bereft of individuals of philosophic initiative.

With respect to Africa north of the Sahara, it has not been possible for anyone to harbour a like misapprehension. The existence of individual philosophical thinkers in ancient Egypt has never been in doubt, even if their exact racial identity has been the subject of debate. Moreover, the Arab portions of Africa are heir to a time-honoured Islamic tradition of written philosophy. Even further south, it is widely known, through the industry of Claude Sumner of the University of Addis Ababa, that in Ethiopia there is a historical heritage of written philosophy (see Ethiopia, philosophy in §1). The high point of that heritage is *The Treatise of Zar'a Ya'ecob* ([*c*.1599-*c*.1692] 1993). Living and meditating contemporaneously with Descartes, although independent of him, and initially in seclusion (by reason of Catholic persecution), Zar'a Ya'ecob developed a philosophy which affirmed belief in God, but subordinated religious creeds and their moral prescriptions to the dictates of reason. He held that in the search for truth, especially in religious matters, no one should passively depend on the determinations of other people 'for all men are plaintiffs and defendants between themselves' ([*c*.1599-*c*.1692] 1993: 17). Everyone should be guided by the light of their own intelligence. That intelligence is capable of conceiving of God as 'a creator, greater than all creatures' and of 'seeing him mentally'. Out of 'the abundance of his intelligence' God has created a world of natural law and order and given us the intelligence to grasp it if we would but inquire rationally. Accordingly, in his evaluations of religious teachings he proceeds on the principle that something accords with the will of God only if it accords with the deliverances of reason. With this intellectual weapon he makes short work of Christian 'stories of miracles that they claim had been wrought in Egypt and on Mount Sinai' by Moses. Nor is he any less scathing of certain Mohammedan tenets. For example, he believes that Mohammed's teaching 'that a man could marry many wives' could not possibly come from God as it 'ruins the usefulness of marriage' ([*c*.1599-*c*.1692] 1993: 18-19).

In general Ya'ecob's treatment of morality is uncompromisingly rationalistic. For him the golden rule is a directive of reason. Since the 'prohibitions of killing, stealing, lying, adultery' are derivable from it, he says of them: 'our reason teaches us these and similar ones'. In respect of these, therefore, 'the decalogue of the Pentateuch expresses the will of the creator'. But he makes an exception in the case of the commandment of the Sabbath because 'reason says nothing of the observance of the Sabbath' ([*c*.1599-*c*.1692] 1993: 21). Altogether, Ya'ecob sets up a stringent regime of reason in the face of which Descartes might conceivably have balked. Undoubtedly, the work of Ya'ecob is eminent in what might be called the classical heritage of African philosophy.

7 The quest for a synthesis

The study and evaluation of African traditional philosophy and the classical heritage of African philosophy are two of the more straightforward components of the agenda of contemporary African philosophy. Another, infinitely trickier, is the project of synthesizing any insights that might be had from the study of Western philosophy (and

any other philosophical traditions) with those gained from indigenous sources in the construction of African philosophies for contemporary existence (from which open-minded non-Africans might have something to learn). One potent source of ambivalence among some Africans towards this type of effort, as it pertains to Western philosophy, is the fact that it is apt to look like a mindless imitation of the philosophical ways of one's erstwhile colonizers. The best antidote to such qualms is for African researchers to be conscious of their African purposes and always to scrutinize critically the conceptual pertinence - recall the need for conceptual decolonization - and the theoretical soundness of any appropriations of ideas or adaptations of technique. They do not need to approach the enterprise in a spirit of passivity. In principle, they can make original and enriching contributions, at one and the same time, to the given foreign tradition as well as to their own: a fact which is sometimes forgotten. There are, moreover, existential reasons for African interest in Western philosophy. Through the twin historical facts of Western colonization and Christian evangelization, African cultures have been profoundly impregnated with ethical, metaphysical and epistemological ideas of a Western provenance. These ideas cry out for critical examination in Africa as much as in their places of origin. (The principle is applicable, *mutatis mutandis*, to Islamic ideas in Africa.)

Whether in full realization of these considerations or from a semiconscious attunement to the needs and possibilities of the contemporary African situation, many African philosophers have devoted considerable attention to topics that historically have been grist for the Western philosophical mill. The unspoken principle of this practice is that they can be turned to African purposes too. The 1980s and 1990s have seen a great deal of African philosophical output of this sort.

Africans working towards the advancement of African philosophy can ponder the historic precedent of such famous sons of Africa as Tertullian, St Cyprian and St Augustine. These were among the Graeco-Romanized indigenes of colonized North Africa whose thought has influenced Western philosophy, leaving in some cases permanent imprints. They do not seem in their intellectual efforts to have been motivated by the quest for a synthesis of the African and non-African elements in their experience, although it cannot be assumed that their thinking was altogether without African traces. On the contrary, it may well be, as John Ferguson suggests in his essay 'Aspects of Early Christianity in North Africa' (1969), that the character of the Christianity they advocated owed something to their African background. Nevertheless, forging an African tradition of thought does not seem to have been a priority in their concerns. In pursuit of this objective Africans will have to bend any foriegn influences to African purposes. These purposes will sometimes be common to humankind, but sometimes contingent upon the distinctive circumstances of African existence.

African philosophy, Francophone

The imaginative and intellectual writings that have come out of French-speaking Africa have tended to be associated exclusively with the négritude *movement and its global postulation of a black racial identity founded upon an original African essence. Beyond its polemical stance with regard to colonialism, the movement generated a theoretical discourse which served both as a means of self-validation for the African in particular and the black race in general. This discourse developed further as the elaboration of a new worldview derived from the African cultural inheritance of a new humanism that lays claim to universal significance.*

Despite its prominence in the intellectual history of Francophone Africa and in the black world generally, négritude *does not account for the full range of intellectual activity among the French-speaking African intelligentsia. The terms of its formulation have been challenged since its inception, leading to ongoing controversy. This challenge concerns the validity of the concept itself and its functional significance in contemporary African thought and collective life. It has involved a debate regarding the essential nature of the African, as well as the possibility of constructing a rigorous and coherent structure of ideas (with an indisputable philosophical status) derived from the belief systems and normative concepts implicit in the institutions and cultural practices subsisting from Africa's precolonial past.*

The postcolonial situation has enlarged the terms of this debate in French-speaking Africa. It has come to cover a more diverse range of issues touching upon the African experience of modernity. As an extension of the 'indigenist' theme which is its point of departure, the cultural and philosophical arguments initiated by the adherents of négritude *encompass a critical reappraisal of the Western tradition of philosophy and its historical consequences, as well as a consideration of its transforming potential in the African context. Beyond the essentialism implied by the concept of* négritude *and related theories of Africanism, the problem at the centre of French-African intellectual preoccupations relates to the modalities of African existence in the modern world.*

From this perspective, the movement of ideas of the French-speaking African intelligentsia demonstrates the plurality of African discourse, as shaped by a continuing crisis of African consciousness provoked by the momentous process of transition to modernity. A convergence can be discerned between the themes and styles of philosophical discourse and inquiry in Francophone Africa and some of the significant currents of twentieth-century European philosophy and social thought engaged with the fundamental human issues raised by the impact of modern technological civilization.

Two dominant perspectives frame the evolution of contemporary thought and philosophical discourse in French-speaking Africa: the first is related to the question of identity and involves the reclamation of a cultural and spiritual heritage considered to be imperilled; the second relates to what has been called 'the dilemma of modernity' experienced as a problematic dimension of contemporary African life and consciousness.

1 The French colonial context

The development of philosophical discourse as a distinct current of intellectual activity in Francophone Africa has run parallel to that of an innovative imaginative expression. Such development is bound up with the ideological project of an assertive cultural nationalism. The movement of thought that informs the process of self-reflection on the part of French-speaking African intellectuals, culminating in the idea of *négritude*, derives its impulse from an affective response to the colonial situation. It reflects an effort to grapple with the multiple implications of the collective predicament that forms the larger historical context of the colonial experience, namely the violent encounter between Africa and Europe and its concomitant ideological devaluation of the black race. These factors and the inherent discomforts of the immense process of social and cultural change have been determinants in the origin and evolution of what Robert July (1968) has called 'modern African thought'.

If the general circumstances of the historic conflict between Africa and Europe provide the sentimental hinterland from which the energy of intellectual activity in Africa derives, the specific orientation of contemporary thought in Francophone Africa has been further conditioned by the sustained contact of its intellectual elite with the literary and philosophical traditions to which their French education gave them access. It is worthy of note that the cultural tenets of colonial administration in the areas of Africa under French and Belgian rule, and the educational system

they inspired, were given coherence as functional elements of what was termed the policy of assimilation. The notion of the civilizing mission of European colonialism central to this policy was premised on the idea of the basic inferiority of African culture, which was in need of the redeeming function of Western civilizing values. Constraints of assimilation account for the centrality in Francophone African literature of the theme of alienation, which was given expression as a sense of dissociation from the moral and psychological security of defining origins. The imaginative exploration of this theme found its parallel in a conceptual engagement on the part of the Francophone black (African and Caribbean) intellectual elite with the question of identity. The force of lived experience lent urgency to the thought-provoking question of existence. For the Francophone African elite who were 'assimilated' but none the less preoccupied with interpreting and coming to terms with the colonial experience, intellectual activity could only proceed as a meditation upon the self in relation to a singular historicity.

Associated with the cultural malaise of assimilation was the negative image of Africa that was constantly projected by the Western texts on which was based much of the education of the Francophone African elite. The ideological thrust of these texts is exemplified by the work of Pierre Loti (1888) and other writers associated with the so-called colonial novel. Their perspective helped to propagate the idea of Africa as a landscape whose inhospitable nature was reflected in the savage disposition of its indigenous populations (Fanoudh-Siefer 1968). This literature was the symbolic expression of a European ethnocentrism that had been given philosophical respectability by Hegel, who excluded the African continent from his conception of the world historical process and the unfolding of the universal mind, the foundations of his philosophical system. Arthur de Gobineau's *Essai sur l'inégalité des races humaines* (1884) gave systematic form to the hierarchy of the races established as commonplace to European thought in his time within which African and black races occupied the lowest level. However, it was left to Lucien Lévy-Bruhl to lend the authority of learned discourse to the great divide between the West and the rest of humanity affirmed in de Gobineau's essay. In the series of studies beginning with *Les fonctions mentales dans les sociétés inférieures* (1912) and culminating in *La mentalité primitive* (1922), Lévy-Bruhl undertook to establish the disparity between Western and non-Western cultures at the level of the mental operations by which both were regulated. The term 'prelogical mentality' which he proposed to describe the quality of mind of non-Western peoples was to have resonance beyond the discipline of anthropology. These and other works of the same tenor composed an articulated Western discourse on Africa, which emerged as the antithesis of Europe in the structure of ideas and images by which the colonial ideology was sustained.

2 Intellectual resistance to colonial discourse

The counterdiscourse that was articulated by the Francophone African elite in the 1930s was called into being by the demoralizing effect and egregious nature of this discourse of imperial hegemony. Their response was facilitated by the crisis of European civilization in the early twentieth century after the First World War. The disenchantment with the traditional humanism in Europe reflected in the literature and philosophy of the period provided an appropriate context for the note of dissidence voiced in the ideological writings of the colonized Francophone black intellectual (Kesteloot 1965). Marxism and Surrealism were primary influences, but more pertinent were the formative roles played by French thinkers in the interwar years, which added a particular tone to the expression of some of the leading figures in Francophone African intellectual movements. Of special interest in this respect is the organic nationalism of Maurice Barrès and the anti-intellectualist philosophy of Henri-Louis Bergson, both of whom bequeathed an ambiguous legacy of attitudes and ideas to the cultural nationalism of France's colonial subjects. While the conflation of race and culture provided an anchor in Barrès (1897) for an exclusive vision of the national community, Bergson promoted a special reverence for those noncognitive modes of experience embodied in forms of artistic expression in reaction against the dominant rationalist tradition. Both laid the foundation for Senghor's later celebration of *négritude* as a black racial endowment and provided the language for its formulation.

Paradoxically, the discipline of anthropology, in which a new spirit of cultural relativism had begun to prevail, provided the immediate source of intellectual armoury of the Francophone African response to colonial ideology. The efforts of French scholars Robert Delavignette and Maurice Delafosse to explicate African forms of social and cultural expression and accord them recognition culminated in Marcel Griaule's *Dieux d'eau: entretiens avec Ogotemmeli* (1948). The articulation in this work of the elaborate cosmology of the Dogon, as related by the African sage Ogotommeli, revealed an evident symbolic architecture and conceptual organization in an African

culture that advanced the case for a revaluation of the continent and its peoples.

3 Placide Tempels's *Bantu Philosophy*

Placide Tempels's *Bantu Philosophy* (1945) was decisive in giving a philosophical orientation to the emerging discourse of cultural nationalism in Francophone African. Tempels's objective was to reveal the existence of a reflective disposition among the Luba, an ethnic group in the then Belgian Congo. He ascribed to them a collective philosophy distinguished by an ontology summed up in the following quotation:

> I believe that we should most faithfully render Bantu thought in the European language by saying that the Bantu speak, act, live as if, for them, beings were forces. Force is not for them an adventitious accidental reality. Force is even more than a necessary attribute of beings: Force is the nature of being, force is being, being is force.
>
> (1945: 35)

The passage makes obvious the derivation of Tempels's work from Bergson: the notion of 'vital force' by which he sought to characterize Bantu thought recalled the French philosopher's *élan vital*. Tempels's reconstruction of mental structure from 'collective representations' dear to Durkheim and his disciples in the French school of anthropology was an application of Lévy-Bruhl's method, although a reversal of its theoretical import and ideological implications. *Bantu Philosophy* provided the model and conceptual framework for the construction of an original African philosophy and has remained a central reference of philosophical debate in Africa.

4 *Négritude*

It is against this historical and intellectual background that the concept of *négritude* took form. It was the eminent French philosopher Jean-Paul Sartre who was the first to give the concept extended philosophical formulation. His essay 'Orphée noir' (Black Orpheus) (1949) was an expansive reflection on the term which had been coined by the Martinican poet Aimé Césaire in the context of his poem *Cahier d'un retour au pays natal (Notebook of a Return to my Native Land)* (1939) to denote the advent of a liberated black consciousness. In the essay Sartre offered a definition of *négritude* in Heideggerian/Existentialist terms, as 'the-being-in-the-world-of-the-Negro'. Extending this definition by reference to the orthodoxies of Marxism, he situated the racial consciousness designated by *négritude* and the project of collective freedom it proclaimed in an historical perspective as a stage in a dialectic destined to be transcended by the advent of a classless and raceless world society.

Senghor's conception of *négritude* both enlarges upon Sartre's definition and gives it a new orientation. Rather than a contingent factor of black collective existence and consciousness as with Sartre (for Senghor this aspect corresponds to what he calls 'subjective *négritude*'), the concept denotes for Senghor an enduring quality of being constitutive of the black race and exempt from the exigencies of the historical process. The term further signifies a complex of objective factors that shape the African experience, embodied in forms of life on the continent and manifested in the modes of thought and feeling of its people, hence Senghor's definition of *négritude* as 'the sum total of African cultural values' (1970). His theory of *négritude* takes the form of an exposition of the African's distinctive manner of relating to the world. Appropriating Lévy-Bruhl's notion of 'participation', Senghor accords primacy to emotion as distinctive of an African mode of access to the world. Emotion is accorded special signification by Senghor; it is no longer merely a psychological state, but a mode of apprehension, a 'capturing of integral being - body and consciousness - by the indeterminate world' (1962: 15). Senghor's thinking concerns itself with the opposition between both the mystical approach to reality that the developed emotion determines in the African, as well as the pure intellection that is held to be characteristic of the West and historically enshrined in the *cogito* of Descartes. According to Senghor, emotion is governed by intentionality and thus presents itself as a valid mode of cognition.

We have here the epistemological foundation of the African worldview and collective ethos as interpreted by Senghor, who posits in the African a total grasp of reality embracing the continuum from the realm of nature to the supernatural. The informing principle of this *Weltanschauung* and system of social organization emanating from it amounts to a spiritualism that invests all phenomena with a sacred character. Senghor has extended this idea into his theory of African socialism, presented as the social philosophy entailed by the theory of *négritude*. Although commanded by practical considerations, African socialism as enunciated by him is a strategy for reconciling the

imperatives of modernity - social and economic development in Western terms -with an African ethos. For Senghor (1961) this socialist ideal is governed by the need to infuse the humanizing values of traditional Africa into the new structures of collective life in the modern dispensation. Therefore, African socialism presents itself less as the construction of a concrete social progamme than as an axiology.

Senghor's theory of *négritude* developed as a function of his poetic vocation. Although in later works (Ndaw 1983) he restated his system of ideas to align it more closely with the classical epistemology codified by Aristotle, the theory bears a close affinity with the various continental forms of Lebensphilosophie that have sprung up as a reaction to the instrumental reason of modern social organization (see Lebensphilosophie). There is a sense in which Senghor's *négritude* may be interpreted as an African version of Bergsonism: a verification in African form of the cultural expression of the idea of intuition as the sign of experience at the most profound level of consciousness.

5 Ethnophilosophy

Senghor's *négritude* represents an effort to provide a comprehensive elucidation of African being. Despite its limitations and disputed status as philosophy, it marks, as D.A. Masolo has observed, 'the legitimate origin of philosophical discussion in Africa' (1994: 10). The movement of self-definition it initiated led to the effort in Francophone Africa to generate an African philosophy from anthropological literature pertaining to the traditional cultures on the continent. The school of thought spawned by this effort, known as ethnophilosophy, is represented by Alexis Kagamé's *La Philosophie bantu-rwandaise de l'être (Bantu-Rwandan Philosophy of Being)* (1956), a work conceived as a verification and reformulation of Tempels's propositions in more rigorous analytical terms. Kagamé appealed to his native Rwandan language to reconstruct the philosophy underlying his people's worldview. From the root stem, *ntu*, signifying essence in general, Kagamé has deduced four fundamental categories of Bantu thought: man, being endowed with intelligence, or *muntu*; being without intelligence, such as animals, plants, minerals, or *kintu*; the space-time continuum, or *hantu* and modality, or *kuntu*. According to Kagamé these terms function both as markers of implicit thought processes and vehicles of an explicit philosophical discourse demonstrable by reference to Rwandan oral tradition.

Kagamé's exposition is not intended as a reconstruction but as a description, *stricto sensu*, of an authentic system of Bantu thought, which corresponds with Aristotle's system for its translation into a non-African language and frame of reference. For this reason the work raises the question of language in African philosophy and the problem that Benveniste has identified as the relation between 'categories of language and categories of thought' (1966). Kagamé's pioneering effort was followed up by explorations of traditional systems of thought in the work of scholars who form what V.Y. Mudimbe has designated (1986) as Tempels's philosophical school. Composed mainly of central Africans and dominated by clerics, the major preoccupation of this school has been to identify those elements of the African personality compatible with Christian doctrine. Their endeavour has fostered the emergence of a theology that reconciles the West and Africa through a shared spirituality.

6 Cheikh Anta Diop

Ethnophilosophy, as a direct tributary of *négritude*, seeks to define African identity in terms of an ontology. Another current of cultural nationalism, the historical school associated with the work and personality of the Senegalese scholar Cheikh Anta Diop, discovers this identity in what may be called an African *longue durée*. Diop is best known for his book *Nations nègres et culture (Black Nations and Culture)* (1956), which advanced the thesis of ancient Egypt as an integral part of a black African civilization. The real significance of Diop's work resides less in the validity of his arguments and conclusions than in the development he gave to the thesis in subsequent works. In *L'Unité culturelle de l'Afrique noire (Cultural Unity of Black Africa)* (1959), Diop considered Africa as a single, unified cultural area on the basis of the continuity of cultural forms and value systems between ancient Egypt and indigenous civilizations throughout Africa. This argument was summarized in 'Egypte ancienne et Afrique noire' (1962). The philosophical implications of Diop's work emerge from the comprehensive vision of Africa's historical personality by which it is informed and its spirit of confrontation with Hegel's philosophy of history. The erudition and methodological effort he invested in constructing an 'historical sociology' aimed to restore Africa to an honourable place in universal history. As he says, 'Historical science cannot shed all the light one might expect it to cast upon the past until it integrates the African component of humanity, in proportion to the role it has actually played in history, into its synthesis' (1962: 11).

Diop's work established a line of historical reflection and research in Francophone Africa, as exemplified in the writings of Joseph Ki-Zerbo (1972) and especially Théophile Obenga, Diop's most accomplished disciple. His *L'Afrique dans l'Antiquité* (1970) represents a summation of the ideas and methods of the school spawned by Diop (see Egyptian philosophy: influence on ancient Greek thought).

7 The critique of *négritude*

A reaction set in against the theory of a black racial self and the creation of an African collective identity propounded by *négritude* and endorsed by ethnophilosophy. The critique of *négritude*, which began in the 1950s with attacks on Sartre's definition by Albert Franklin (1953) and Gabriel D'Arboussier (1959), developed into controversy that has not subsided. The radical spirit of this critique was embodied in the work of Frantz Fanon, beginning with his analysis of the pathology of colonialism in *Black Skin, White Masks* (1952). This analysis took the form of a Hegelian enactment of the black subject's drama of consciousness, that of the struggle for recognition involved in the master/slave dialectic. Fanon's clinical perspective focused on the inward psychological depredations of colonial domination. The ethics of violence elaborated in *The Wretched of the Earth* (1961) springs from his conception of its restorative value for the colonized native. His uncompromising radicalism with its repudiation of mere culturalism endows violence with a transcendent significance: 'African culture will take concrete shape around the struggle of the people, not around songs, poems or folklore' (1961: 164).

The critique of Senghor undertaken by Stanilas Adotevi (1972) owes its force to Fanon's example and to his disposal of identity as an issue worthy of moral concern and theoretical interest. Fanon's influence also accounts for the break with the spirit of cultural nationalism embodied in *négritude* by the philosopher Marcien Towa (1971). His intransigence is displayed in the following terms: 'The transformation of one's present condition signifies at the same time the transformation of one's essence, of what is particular to the self, of what is original and unique about it; it is to enter into a negative relationship with the self' (1971: 41). This growing disaffection towards *négritude* developed into a theoretical attack on ethnophilosophy as its outgrowth, marking a significant phase in the evolution of Francophone African philosophy. Eboussi-Boulaga's initial objection to Tempels, whose philosophy he described as 'an ontological system that is totally unconscious, and given expression in an inadequate and incoherent vocabulary' (1968) extended in Towa's essay into a critical reappraisal of ethnophilosophy, culminating in an effort to demolish its conceptual edifice in Paulin Hountondji's *African Philosophy: Myth or Reality* (1983). Hountondji's focus on the methodological procedures of the ethnophilosophers led him to discern a 'confusion of genres' in their attempts to construct a philosophical discourse from material with an ethnological interest. For him ethnophilosophy was 'a hybrid ideological discipline without a status in the world of theory' (1983: 52). To the unanimism implicit in the conception of philosophy as a collective system of thought immanent in a people's culture, Hountondji opposed the criterion of philosophy as an explicit discourse and its rigorous character as a critical activity. He represented philosophy as a reflection on science considered as a significant component of modern culture and equated the philosophical enterprise with the development of science. The lack of scientific culture in Africa forced him to reach the conclusion that the continent is a long way from fulfilling the conditions necessary for philosophical practice.

Hountondji progressed from a narrow conception of philosophy to a broader view amounting to a form of pragmatism (see Pragmatism), involving an interrogation of the possible function of philosophy in the African context. A reappraisal of modes of scientific thought and practice in traditional Africa and a concern for their modernization and expansion in contemporary Africa have come to provide the principal orientation of his reflection, inspired by a sharper sense of the possible relation of philosophy to public policy and social practice. Therefore, the role of philosophy has come to include for Hountondji 'the analysis of the collective experience with a view toward a critique of everyday life' (1992: 359). The political implications of such a critique, suggested by the work of Henri Lefebvre in France after the precedent of the Frankfurt school, are made clear.

The political dimension of Hountondji's critique is fully actualized in Achille Mbembe's 'Provisional Notes on the Postcolony' (1992: 3-37). A phenomenology of political life in contemporary Africa, the essay emphasizes the introspective and critical character of intellectual activity in French-speaking Africa in the postindependence period as a function of the existential problems inherent in the process of transition in contemporary Africa. Beyond what has been called 'the crisis of relevance' in African philosophy (Oladipo 1992), this activity aims to

lay the philosophical foundation for social development in Africa in pursuit of a new order of collective life, which Hountondji termed ‘the Utopia of another society’ (Mudimbe 1992: 360).

8 V.Y. Mudimbe and the critique of Africanist discourses

Valentin Mudimbe’s work is significant in terms of the question of the relationship of discourse and constitution of thought with the ambiguous modernity of Africa. He delineated, after Foucault, an ‘archaeology of African knowledge’ motivated by the ambition to found a new African philosophy with an original register of enunciation, able to underwrite Africa’s conceptual autonomy. In *L’autre face du royaume* (1973), he criticizes the discourse of ethnology as an aberrant language.

The Invention of Africa (1988), Mudimbe’s best known work, is a development of this judgment and an examination of its implications for African expression in the modern world. In his view the homology between the political and economic imperialism of the West on one hand and its ‘epistemological imperialism’ on the other, constitutes Africa as a province of a Western epistemological territory. The function of anthropology developed through the nineteenth century was to ‘account for the normality, creative dynamism and achievements of the "civilized world" against the abnormality, deviance and primitiveness of the non-literate world’ (1988: 24). African studies formed part of this development. It has been so fully integrated into the Western order of discourse that the entry of Africans served to amplify the conceptual scope of this order in what Mudimbe calls a ‘discourse of succession’. Mudimbe remarked that ‘the main problem concerning the being of African discourse remains one of the transference of methods and their cultural integration in Africa’ (1988: 182). His solution was to adapt structuralism to the project of reconstruction in African philosophy (see Structuralism). The structuralist method permits an escape from the constraints of a systematized rationality while affording an entry into the truth of the world: ‘empirical categories can be used as keys to a silent code, leading to universals’ (1988: 35). It is unclear how this approach yields the ‘absolute’ or ‘transhistoric discourse’ that Mudimbe claims as the alternative to Western rationality. Despite what a commentator has called ‘the ambiguous nature of the project suggested by Mudimbe’ (Masolo 1991: 109), the interest in Mudimbe’s work resides in its account of the African intellectual adventure, which amounts to a vision of the African mind in its encounter with the Western world system.

9 Summary

The themes and positions reviewed provide the main lines of French African thought which have inspired a current of philosophical activity in Africa with its own style of discourse. This has prompted the view that the academic practice of philosophy in Africa is divided between the analytical tradition in Anglophone Africa and the continental tradition in Francophone Africa. Philosophical inquiry in both parts of Africa exhibits the three modes that Richard Rorty has identified in contemporary Western philosophy as ‘science, metaphor, politics’ (1991: 9-26). Although French-speaking African philosophers do not employ the vocabulary of Anglo-American analytical philosophy, the debate on the epistemological status of traditional thought in Africa has involved them in a sustained reflection on the nature and scope of philosophy itself. Both sides in the debate have been obliged to undertake a clarification of the terms of their discourse, as with Kagamé, whose categories also receive some close technical scrutiny by Hountondji (1983: 188-9). The debate has generated a metaphilosophy concerned with issues such as the relation of myth to metaphysics and the procedural questions touching upon the proper order of terms and concepts as well as the conditions of philosophy as both a discipline and cultural practice. The debate assumes significance by reason of the comparative perspective it projects on the discipline, covering such questions as the meaning of concepts across cultures, leading ultimately to the problem of universalism.

Francophone African thought provides an African perspective on the relation between ‘Thought and Change’ (Gellner 1965) demonstrated in the West by the progressive imbrication of social science with philosophy since Weber: a development that points to a critical engagement with the whole range of political, social, cultural, moral and aesthetic issues posed to modern awareness by the triumph of rationalism and the scientific revolution. The critical thrust of current debates associated with postmodernism concerning the philosophical legacy of the Enlightenment reflects a sustained effort of internal reassessment in the West, a process in which the reappraisal of Western rationalism by Senghor and other French-speaking African intellectuals is profoundly implicated. As a ‘strategy of differentiation’ (Irele 1995: 15-34), *négritude* seeks to redefine the terms of the relationship between peoples and cultures within a comprehensive intelligence of the world. The metaphoric allure of a certain style of philosophical discourse identified by Rorty is captured in *négritude*, whose speculative mode offers a challenge to

the Western paradigm in rejection of its 'master narratives' (Lyotard 1979).

Beyond this polemical aspect of *négritude*, which also informs Mudimbe's work, Francophone African philosophy assumed a theoretical and historical interest in a global assessment of the dominant trends in modern philosophy and social thought. The commonality between such developments in Western thought exemplified by the Frankfurt school's critique of culture in modern industrial society (see Frankfurt School), the Neo-Marxism of Henri Lefebvre, North American neopragmatism and 'communitarianism' bears witness to a renewed focus on first order questions and on concrete issues of existence in the 'lifeworld' (Habermas 1985). The intersection between these trends in modern Western philosophy and intellectual activity in French-speaking Africa assumes a broad contemporary significance in this light, as under the pressure of historical experience, French-speaking African intellectuals have forced philosophy to confront anew the problems that presided at its origins in the West and which seem to govern its future direction.

African traditional religions

Religion has been at the centre of recent philosophical debate in Africa for two major reasons. The first is that the answers to many central canonical philosophical questions in precolonial African societies take a religious form. As a result any attempt to construct an African philosophy begs attention to the epistemological and ontological standing of claims of this general sort. The second reason religion has been central to African philosophy is that one of the major issues in modern African philosophy is whether distinctively African modes of thought exist. Within this debate influential positions have been argued by reflecting on the character of traditional religious thought and practice and contrasting it with modes of thought purportedly associated with Western science.

1 Religion

Religion is a term whose definition is seen as controversial. Beliefs, institutions and practices can be said to be religious, but the relative importance of belief as opposed to ritual practice, or of ethical belief as opposed to the metaphysical, varies greatly among the belief systems with which Westerners might be familiar - Christianty, Buddhism, Judaism and Islam. Questions of creed, reflecting both the centrality of such questions to Western philosophy and the crucial role of creeds in Christian thinking are at the heart of the literature under discussion in this entry, which derives mainly from philosophers educated in Christian cultures. It will be necessary to draw attention to matters obscured by the focus on matters of propositional belief.

2 ‘African traditional religion and Western science’

Philosopher-anthropologist Robin Horton(1967) wrote a paper with this title in which he argued that the religious ideas of precolonial Africa maintained by many postcolonial Africans were best understood as constituting a body of theory whose fundamental aim, like that of Western science, was explanation, prediction and control of the phenomena of everyday life. Horton made the claim that traditional African religion is like modern Western science. Horton begins with the idea that anthropology’s first task is to provide for one culture, ‘the West’, an understanding of the concepts of another. Translation is the first step of this task. In the preface of *Patterns of Thought in Africa and the West* (1993) Horton argued that, ‘since translation involved finding equivalences of intention and structure between source-language and target-language, it followed that the scholar in quest of the appropriate translation instruments for African religious thought must be prepared to inquire deeply into the intentions and structures embodied in various areas of Western discourse’ (1993: 2). At the time of writing, ethnographic studies of African religion were dominated by a sort of Durkheimian consensus which held that religious notions were fundamentally symbolic of social relations. Taken to extremes this led to the ‘symbolist’ view that religious practices, far from being attempts to mobilize the world of spirits in the pursuit of mortal ends, were, like art, fundamentally expressive with the aim of representing social norms and ideas. Symbolists wanted to deny in particular that religious appeal to spirits presupposes literal belief in them any more than, for example, the function of *Hamlet* as drama requires belief in the literal existence of a Danish prince.

One motive for this view, Horton suggested, was the urge to escape the ethnocentrism of Victorian anthropology with its image of childlike primitives. In their rush to avoid ethnocentrism Horton thought that some symbolists, faced with the irrationality of traditional beliefs, insist that these beliefs are both rational and ‘symbolically’ true. Horton shares the urge to avoid ethnocentrism, but argues that the assumption underlying this argument that the beliefs are irrational is equally ethnocentric. False beliefs, simply put, do not have to be irrational.

Against the symbolists Horton argued that if any area of discourse in the West provided a model for the central purposes of African religious thought, it was not art but science. He sketched a picture of the role of science in the West as the development of theories which seek to place events in a wider causal context than that provided by common sense. At the heart of this process, in Horton’s account, was the development of a structure of belief in invisible entities whose behaviour accounted for the manifest behaviour of the visible world. He felt a key element of theory building was the development of analogies between invisible entities and visible ones. In the natural sciences these invisible entities - atoms and molecules - were modelled on everyday inanimate objects like tiny billiard balls speeding about in the vast spaces of the microcosm, crashing into each other from time to time. (All this at his time of writing amounted to mainstream philosophy of science.) In African religions, invisible entities - gods and spirits - were modelled not on objects but on human beings.

Horton pointed to this difference and offered to explain it, suggesting that it arose from the fundamental nature of explanation as the reduction of the unfamiliar to the familiar. In traditional cultures nature is untamed, alien and a source of puzzlement and fear. Social relations and people, on the contrary, are familiar and well understood. Thus, explaining the behaviour of nature in terms of agency is reducing the unfamiliar forces of the wild to the familiar explanatory categories of personal relations. In the West, on the other hand, 'alienated man' finds social relations puzzling and problematic and the physical world seems stable and familiar.

Horton went on to argue for a further difference. His summary was that African thought, unlike Western science, operated in a 'closed' predicament. His use of language derived from Karl Popper's distinction between 'open' and 'closed' societies (see Popper, K.R.), but Horton reduced Popper's connected set of oppositions to a simpler contrast: that between closed cultures 'characterized by a lack of awareness of alternatives, sacredness of beliefs, and anxiety about threats to them' (1993: 223) and open cultures, aware of alternatives and less threatened by the possibility of intellectual change.

These arguments have been subjected over the years to a great deal of scrutiny. The most controversial claims presuppose that precolonial African societies have remain unchanged. The stability of social relations implicit in his explanation of why people are appealed to as models, is belied by the turbulent history of many regions of west Africa since the 1700s. The very same wars and migrations must have made people extremely aware of alternative theoretical possibilities. This question of the openness of traditional cultures will be examined later.

3 Initial criticism

The centrality of Horton's argument about religion to the debate in Anglophone African philosophy is evident in the quantity of papers devoted to this question in the leading Anglophone African journal *Second Order*. In the first issue in 1972 Vernon Pratt argued, after Wittgenstein, that Horton had understated the significance of the fact that it was agents not objects that were central to traditional religious theory. Explanations in terms of agency, he argued, differ from causal explanations in two crucial ways. First, agency is intrinsically unpredictable: someone is predictable only if his choice 'has been made for him'. Second, 'it is of the nature of an action to *break in* on a course of events'. Horton (1967) replied that the first of these claims was mistaken and the second claim, although true, did not distinguish agent explanation from the general causal explanation.

A similar debate occurred between Horton and Beattie, the symbolist-anthropologist, in which Beattie (1973) offered a number of arguments in defence of the view that traditional religion does not involve literal belief in spirits. He argued that the reason why spirits are perceived as unobservable is that the practitioners of traditional religion understand that they do not exist. He suggested that religious entities are invoked at the point where a problem cannot be dealt with by 'available empirically-grounded techniques' and that they must therefore be dealt with 'in terms of expressive symbolism' (1993: 4). Horton responded with the view that there is no reason to suppose either that traditional believers are unconvinced of the existence of the spirits to which they refer or that the only possible response to the failure of 'available empirically-grounded techniques' is symbolic, since scientific theory is also a response to such failures.

An interesting philosophical exchange between Horton and John Skorupski (1976) concerned itself with Horton's proposed explanation of the ethnographic observation that in many traditional religions an object is said to belong to a kind to which, as far as an observer is concerned, it obviously does not belong. (Examples are the Nuer identification of twins with birds, reported by Evans-Pritchard in *Nuer Religion* (1956) and the Dinka claim that some men 'are' lions.) Horton proposed that these should be seen as theoretical identifications, such as the famous identification proposed by Eddington (1928) of the 'hard, solid table of common sense thought and action' with the 'largely empty space, peopled by minuscule planetary systems, of theoretical physics' (Horton 1993: 84).

Skorupski argued that Horton misidentified the character of the theoretical identifications of the sciences, believing instead that they are not inherently paradoxical. He went on to suggest that the right Western analogy can be found in certain Christian biblical tales, such as the identification of Christ's body and blood with the bread and wine of the Eucharist.

4 Critiques of the analogy between science and traditional religion

The Ghanaian philosopher Kwasi Wiredu (1980) has indicated that it is *prima facie* very odd to equate traditional

religious belief in west Africa with modern Western scientific theory when the obvious analogy is traditional Western religious belief. Kwame Anthony Appiah (1982), beginning with Wiredu's observation, has argued that the reason the parallel between science and religion is misleading is not, as the symbolists held, that religious appeals to spirits are not meant literally. Rather, Appiah suggested that religion has changed a great deal in the modern West over the centuries, particularly the religious life of intellectuals which has turned increasingly towards 'the contemplative, conceived of as spiritual intercourse with God'. Technical questions have 'remained recalcitrant to scientific investigation - questions about one's relations with others - and questions that could not even in principle be addressed by science - questions of value' (1982: 186). This change makes for substantial differences between the religious life of intellectuals in the industrialized world and that of traditional cultures.

There is a further crucial change, Appiah argues, in the nature of contemplative religion in the West. As interpersonal relations have become less ceremonious, so have private religious acts. Since the reformation, Christian prayer has become more like intimate conversation. The ceremoniousness, or ritual character of religious activity in traditional cultures is not analogous in the world or the practice of science. Appiah also argues that there is more of a fundamental reason why the equation of religion and science is misleading, stating that the social organization of inquiry in modern cultures is radically different from its traditional counterparts. Horton had acknowledged this in his initial discussions of the contrast between 'open' and 'closed' cultures. Much attention has been devoted to criticizing Horton's account and trying to alter it.

5 Critiques of the open-closed dichotomy

Barry Hallen (1977) based his work on his experience of philosophical discussions with Yoruba diviners and healers. He argued that there are certainly African religious traditions that show an awareness of other traditions. Hallen takes as his model Karl Popper's characterization of critical reflection on tradition. This is a significant gesture considering the Popperian provenance of the open-closed dichotomy which identifies the tradition as a tradition, displays an awareness of its consequences and is aware of at least one alternative and might choose to affirm or reject it. These tests show that the Yoruba diviners are critically appreciative of their tradition (see Yoruba epistemology).

In response to Hallen's critique, Horton chose to speak not of the closed nature of traditional belief systems but, borrowing a term from Wole Soyinka (1976), of their being 'accommodative'. He discussed work by students of UK anthropologist E.E. Evans-Pritchard (1937), such as G. Lienhardt's discussion of Dinka religion in *Divinity and Experience* and J. Middleton's *Lugbara Religion*, which not only addressed the kind of static body of belief captured in Evans-Pritchard's picture of the Azande thought world, but also stressed the dynamic and, as Horton came to admit, 'open' way in which they 'devise explanations for novel elements in… experience' and 'their capacity to borrow, re-work and integrate alien ideas in the course of elaborating such explanations'. He claims that it is this '"openness" that has given the traditional cosmologies such tremendous durability in the face of the immense changes that the 20th century has brought to the African scene' (Appiah 1987: 226).

Horton contrasted this accommodative style with the 'adversary' style of scientific theory, characterized by the way in which the main stimulus to change of belief is not 'novel experience but rival theory' (Appiah 1987: 226). This change from the Popperian terminology of 'open' and 'closed' allows Horton to reframe the difference between traditional religion and science as not being related to the individual cognitive strategies, but with social ones.

Evans-Pritchard (1937) argued in his classic work that the Azande were not 'experimentally inclined'; that although inclined to scepticism, their scepticism never reached to the level of general theory; that they did not share their experiences and that their beliefs were 'generally vaguely formulated' (1937: 202-4). However, none of this is true of science: it is centrally experimental; scepticism about general theories is one hallmark of great scientists; information is widely disseminated and precision of formulation is regarded as crucial. Each of these differences, as Appiah argued, is central to the social organization of inquiry.

Anthropologist Jack Goody (1977) argued that a key precondition of these forms of social organization of knowledge is the development of distributed literacy. He claimed that oral cultures have been limited by their inability to reaffirm what other theorists have written against experience. It is this fact, Horton went on to argue(1993: 161-93), that accounts for the possibility of the accommodative style. Literacy makes possible the

precise formulation of the issues under discussion as being characteristic of scientific theory. Precise formulation allows inconsistencies to be recognized.

6 The devout opposition

Perhaps the least known of Horton's controversies outside Africa is the best known among students of African religion because he has taken on a consensus view of African traditional religion developed by a group he dubbed 'the devout opposition'. This group included many Christian professors working in such places as Nigeria. For these scholars 'the focal object' (1993: 165) of African religion is the Christian God. Other spirits are regarded as his agencies and the attitude of believers towards God is one of awe. The group also thought that the aim of religious life was to achieve communion with God. Horton's views are summarized in the form of a debate with this group in his later work (1993) in which he argued, first, that the ethnographic evidence does not support these claims and that it is the desire not to denigrate traditional belief, combined with Christian theology, that leads the devout opposition to their views. He says that:

> 'It is not surprising that the clearest indications of the ideological character of the "devout" position should come from African rather than Western scholars. After all, it is *their* non-Christian kith and kin whose status is at stake… it is clear that there is a strong link… between establishing that African religions show the essential characteristics of True Religion and establishing the human worth and dignity of Africans'.
>
> (1993: 191)

Horton wanted to argue that scholarly discussion of religion can proceed while suspending the issue of whether monotheism is true. However, Appiah (1993: 7) suggested that if there is a God who makes himself known, albeit obscurely, in African religious experience, then his existence and these experiences may be as relevant to understanding the beliefs of Africans as any other facts about the world in which they live. Horton does not pretend to be a theist, however, his argument with the devout opposition is both anthropological and theological. Appiah felt that Horton was wrong in his contention that the question of God's existence is irrelevant to the philosophical study of religion.

Agnosticism

In the popular sense, an agnostic is someone who neither believes nor disbelieves in God, whereas an atheist disbelieves in God. In the strict sense, however, agnosticism is the view that human reason is incapable of providing sufficient rational grounds to justify either the belief that God exists or the belief that God does not exist. In so far as one holds that our beliefs are rational only if they are sufficiently supported by human reason, the person who accepts the philosophical position of agnosticism will hold that neither the belief that God exists nor the belief that God does not exist is rational. In the modern period, agnostics have appealed largely to the philosophies of Hume and Kant as providing the justification for agnosticism as a philosophical position.

1 Degrees of agnosticism

Although the philosophical position described as ‘agnosticism’ - scepticism with respect to the existence or nonexistence of a supernatural divine being - has a long history, the term itself was introduced by Thomas H. Huxley in 1869 in order to provide an ‘ism’ that described his own intellectual outlook on matters of religion.Huxley held that neither belief nor disbelief in the existence of God or some supernatural divine reality is warranted, because in his judgment we are simply unable to discover sufficient rational grounds to support either belief or disbelief. Thus agnosticism as a philosophical position is best understood as the view that it is beyond our cognitive powers to determine the existence or nonexistence of God or some divine reality responsible for the existence of the natural universe.

We can distinguish three sorts of agnostic - weak, moderate and strong:

(1) An agnostic (weak sense) is one who understands the concept of God and/or the concept of a supernatural divine reality, but who neither believes nor disbelieves in the existence of God or in the existence of a divine reality responsible for the existence of the natural universe. This is the popular sense of the term.
(2) An agnostic (moderate sense) is one who is an agnostic in the weak sense, but who also holds that human beings are unable to discover sufficient reason to believe or disbelieve in the existence of such a God or divine reality.
(3) An agnostic (strong sense) is one who is an agnostic in the moderate sense, but who also holds that it is wrong or in some way improper to believe or disbelieve in the existence of such a God or divine reality unless one has a sufficient reason to believe or disbelieve.

A person may be an agnostic (weak sense) without holding that it is beyond human cognitive abilities to discover sufficient reason to believe in God. For one may make a correct assessment of one’s own lack of sufficient reason for belief or disbelief without affirming that no human being is without such reason. An agnostic in the weak sense need not hold the philosophical position of agnosticism, for that position requires that one hold that human cognitive powers are inadequate to justify belief with respect to the existence or nonexistence of God. On the other hand, one can hold the philosophical position of agnosticism without being an agnostic at all, whether weak, moderate or strong. Some religious thinkers (Kierkegaard, for example) have held that it is proper to believe in God by faith even though reason cannot provide sufficient rational grounds for or against the existence of God. Thus a religious believer may accept the philosophical position of agnosticism without being an agnostic in the sense of someone who neither believes nor disbelieves in God.

The moderate agnostic and the strong agnostic hold the philosophical position of agnosticism, although the moderate agnostic need not be critical of the religious believer or disbeliever. For a moderate agnostic may allow that it is not improper to believe or disbelieve without adequate grounds provided by human reason. Only the strong agnostic must be critical of the believer and disbeliever. It is fair to say that most philosophers who have been agnostics have been strong agnostics.

2 Justifications for agnosticism

Justifying agnosticism as a philosophical position requires a careful investigation of the limits of our cognitive powers. Specifically, it must be shown that human reason is simply incapable of reaching either affirmative or negative judgments concerning the existence of the God of traditional theism or any sort of divine reality

responsible for the existence of the natural universe. Huxley and other agnostics professed to find support for their view in the philosophies of Hume §6 and Kant §8. Hume had presented devastating critiques of traditional natural theology in his *Enquiry Concerning Human Understanding* (1748) and his *Dialogues Concerning Natural Religion* (1779). And although Kant, in his *Critique of Pure Reason* (1787), sought to counter what he took to be Humean scepticism regarding scientific knowledge, he repudiated all attempts at speculative metaphysics and natural theology, arguing that such efforts exceed the limits of pure reason.

In the nineteenth century the legacy of Hume and Kant flourished in the agnosticism of Sir William Hamilton, Herbert Spencer, Thomas Huxley, Leslie Stephen and John Stuart Mill. In his influential essay 'Theism' (1874), Mill contended that only the argument from design remained as a potential source for rational support for some form of divine reality responsible for the order, if not the existence, of the natural universe (see God, arguments for the existence of §§4-5). He noted Darwin's competing explanation involving the struggle for survival and natural selection. But since Mill regarded Darwin's theory as a legitimate but unproven hypothesis, he argued that the apparent design in animal life gives some degree of probability to the view that there is an intelligent being which, though finite in power, is responsible for the order in (but not the existence of) the natural world. However, this degree of probability is for Mill apparently insufficient to warrant belief, for he concludes his essay with the judgment that the rational position with respect to the supernatural is agnosticism as distinguished from either belief or disbelief.

In the twentieth century, two philosophical movements gave at least indirect support to agnosticism: logical positivism and naturalism. Logical positivists held that a statement is cognitively meaningful (asserts something true or false) only if it is either analytic or empirically verifiable in principle. They also maintained that statements about the God of traditional theism (or other supernatural entities) are neither analytic nor empirically verifiable in principle. The result is that logical positivism denies the assumption of agnosticism that theism and atheism are intelligible positions, while affirming its conclusion that neither belief nor disbelief in God is rational. Naturalism's basic thesis is that the only things about which reliable knowledge can be obtained are things that can be investigated by the methods of science. This thesis implies agnosticism concerning the supernatural in so far as the supernatural eludes investigation by the methods of science. Since naturalists tend to hold that the only individual things of whose existence we have reliable knowledge are physical things, the conclusion is drawn that the existence or nonexistence of God is unknowable. (Some naturalists have gone on to argue that we do have sufficient evidence for atheism.)

With the collapse of logical positivism and the resurgence of philosophy of religion as a discipline in the latter half of the twentieth century, significant challenges to agnosticism and naturalism have been advanced by philosophers seeking either to establish the truth of traditional theism or to establish that belief in theism is rational. The effort to establish that belief in God is rational has taken three directions. First, against the legacy of Hume and Kant it has been argued that there are truth-conducive reasons or evidence for belief in God. Second, following William James' classic essay 'The Will to Believe' (1897), it has been argued that pragmatic (but non-truth-conducive) reasons for belief in God are sufficient to render belief rational (see James, William §§4-5). Third, some philosophers (such as Plantinga 1981) have argued that belief in God is rational because it is a justified basic belief, rather than a belief justified by evidence. Agnostics, for the most part, have been concerned only with the issue of whether there are sufficient truth-conducive reasons to support belief or disbelief in a supernatural, divine reality.

Agricola, Rudolph (1444-85)

Rudolph Agricola was one of the leading humanists of northern Europe in the late fifteenth century. His polished Latin style, his Greek learning and his knowledge of classical literature made him a hero to Erasmus, More, Vives, Melanchthon and Ramus. His major work, De inventione dialectica (On Dialectical Invention) (1479), provides an original account of practical argumentation by combining elements from the established teachings of rhetoric and dialectic with analysis of passages from classical literature. It includes a new version of the topics of invention, based on Cicero's method of devising arguments, outlined in his Topics. Agricola's letter De formando studio (On Shaping Studies) (1484), which circulated widely in the sixteenth century, outlines a plan of knowledge and discusses methods of study. Although his approach was strongly humanist and the Roman rhetorician Quintilian was his favourite author, his logic remained firmly Aristotelian, unlike that of his predecessor Lorenzo Valla. He remained aware of the achievements of scholasticism, expressing admiration for Duns Scotus and adopting an extreme realist position in metaphysics.

1 Life

Rudolph Agricola (born Roeloff Huusman, at Baflo, near Groningen in the north east Netherlands) received a scholastic education in Belgium at Louvain (MA 1465) before moving on like many other northerners to study law in Italy at Pavia. He neglected his legal studies to concentrate on reading classical Latin literature and improving his Latin style. In 1475 he transferred to Ferrara in order to improve his knowledge of Greek. He served Duke Ercole I d'Este as organist for a time and made the acquaintance of prominent humanists such as Battista Guarini and Ermolao Barbaro. In 1479 he returned to Germany with his friend Dietrich von Plieningen, pausing in Dillingen to complete *De inventione dialectica (On Dialectical Invention)* (1479), before returning to Groningen. He was *secretarius* of Groningen from 1482-4, undertaking diplomatic missions on behalf of the town. He was able to return to full-time study, and to begin learning Hebrew, in 1484 when he went to Heidelberg to assist his friend Johann von Dalberg, who had recently become Bishop of Worms. He taught on the fringes of the university and twice preached to the clergy of the diocese. He died on 27 October 1485 shortly after returning from a journey to Rome to congratulate the newly elected Pope Innocent VIII.

Agricola was fortunate to have spent almost ten years in Italy studying Latin and Greek. In Pavia and Ferrara, he lived at the centre of a group of northern students whose unofficial humanistic studies he supervised and with whom he shared his discoveries. He looked on himself as a perpetual beginner, always learning languages while others went on to higher studies. He planned to devote his old age to biblical studies. For the generation of Erasmus he was most important as an example, the Frisian who had equalled Italians in humanistic learning, since his major work did not appear in print until 1515 (see Humanism, Renaissance §§5-6).

2 *De inventione dialectica*

Dialectical invention for Agricola involves not only finding persuasive material for a composition, but also putting it into an effective order. The core of his *De inventione dialectica* is the topics, the subject of Book 1. Agricola's new version provides a full and clear account of how the topics are used, a better organized list of topics, and a carefully exemplified account of the variety within each topic and the uses of each.

The topics are a list of headings (for example, definition, genus, cause, and effect) which can be applied to any subject. Agricola explains that while the things in the world and the connections between them are infinite in number, nevertheless there are certain common characteristics in the links between things, which can therefore be divided into classes. These classes of relations are the topics. In other words the topics are a useful way of investigating the things which are connected to particular subjects because they correspond to connections which exist in the world. This fits in with Agricola's realist position in metaphysics, and it provides (as no one had before) an explanation for the effectiveness of the topics, but it evidently suits some topics (genus, cause) better than others (etymology, similars).

None of his predecessors had attempted to explain how the (rather heterogeneous) list of topics works or why it is complete, whereas Agricola divides the topics into seven groups in line with the degree of closeness to the subject, ranging from 'within the substance' to 'opposites'. Although this list improves on previous accounts by Aristotle

(§7) (whose conception of the topic is rather different), Cicero (§2) and Boethius (§3), it remains inconsistent in places. Agricola's new topics entries are much longer than those of his predecessors. His approach is practical (showing how a definition is built up), inquiring (thinking about the different relations between causes, intermediate ends and effects) and literary (taking apart a simile by Lucan and exploring the implications of alternative objects of comparison).

In Book 2 Agricola shows how arguments derived from the topics can be used in real argumentative situations, looking at how material can be prepared for topical invention, analysing argumentative and expository writing, discussing the forms of argumentation appropriate in practical use, and providing a number of drills to familiarize the student with the use of the topics. One of these exercises involves analysing the argumentative structures which underlie passages of writing. Agricola himself used this method in his dialectical commentary on Cicero's oration *On the Manilian Law*, which in turn inspired Melanchthon's commentaries (see Melanchthon §§1-2) and the analyses of Ramus (§2) and his followers.

Book 3 shows how the topics can be used to produce material which will move and please an audience as well as teach them. It includes a discussion of emotion which relies on, and refers the reader to, Aristotle's *Rhetoric*. Agricola also revitalizes the rhetorical art of disposition by illustrating the range of possible forms of organization (both overall and local) available to a writer, and by showing how decisions about ordering involve considering subject-matter, audience and the writer's own persona and intention.

Agricola's work has often been linked with Lorenzo Valla's attack on Aristotelian logic in his *Dialectica* (see Valla, L. §3), but in fact Agricola endorses many Aristotelian doctrines which Valla rejects. The two men share an interest in the topics and the aim of writing a logic suitable for practical arguing in neoclassical Latin.

Manuscripts of *De inventione dialectica* were hard to find in the twenty years after Agricola's death, but after 1515 it became one of the most influential dialectic books of the sixteenth century, with forty-four editions of the (very long) text, and thirty-two editions of various epitomes. Praise of Agricola and details from his work can be found in many Renaissance dialectic books, notably in the works of Erasmus, Vives (§4), Melanchthon and Ramus.

3 Other works

Agricola produced translations, orations, letters, poems and treatises. Many of his works are pedagogic in their aim, notably his Latin translation of the *Progymnasmata* (short writing exercises) of Aphthonius, a Greek rhetorician of the third century AD, which in its adaptation by Lorichius became one of the most printed school textbooks of the sixteenth century. His minor works also offer two discussions of the nature and organization of philosophy. The *Oratio in laudem philosophiae (Oration in Praise of Philosophy)* was delivered in autumn 1476 to inaugurate the academic year in Ferrara. Agricola praises philosophy because it investigates everything, because it can turn everything to good, because it enables a person to rise above the vicissitudes of fortune and because the soul knows itself happy in self-contemplation.

Philosophy is divided into rational (grammar, dialectic and rhetoric), natural (physics, which includes medicine, mathematical arts and theology) and moral (politics, justice), according to Agricola. The general scheme seems to derive from the division of philosophy found in Isidore of Seville's *Etymologiae* (see Encyclopedists §7), but Agricola's placing of theology within natural philosophy is original. Agricola's letter *De formando studio (On Shaping Studies)* (1484) chooses philosophy as the subject of study for the addressee, the Antwerp musician Jacques Barbiriau, because of his ability and because he does not require that his studies provide him with income. Philosophy in other words is the highest of studies, but is only open to people with some independence. After setting aside the *trivium* (grammar, rhetoric and dialectic) as the entrance to the arts, not the thing itself, he provides a new division of philosophy into two parts, natural and moral, both of which must be studied using the best authors. Natural philosophy, which includes geography, agriculture, medicine, architecture, painting and sculpture, as well as physics and biology, is valuable in forming the mind because it shows the worthlessness of wealth and the fragility of human bodies. Moral philosophy, the more important part, involves the study of poetry, oratory, history, ethics and sacred writings (both the scriptures and Christian authors).

Agricola discusses three methods of study: reading, the compilation of commonplace books, and the sharing and development of knowledge through composition. In a sense, rather in the manner of Augustine's *De doctrina christiana (On Christian Doctrine)*, a literary approach, and a choice of classical and Christian authors, have taken

over the whole of philosophy (though it should be remembered that the elder Pliny's *Natural History* was one of Agricola's favourite books). Agricola also wrote two small treatises, *Singulares aliquot de universalibus quaestiones (Some Questions about the Universals)* (1539) and the unpublished *De universali singulari et uno (On the Universal, the Singular and the One)*, in which he maintains that all universal terms correspond to real things in the world. These treatises await thorough study, as does Agricola's understanding of Ramon Llull, to whom he makes a tantalizing reference in *De inventione dialectica*.

Agricultural ethics

Agricultural ethics is the study of moral issues raised by farming. These include: human interference with the course of nature; the effects of certain agricultural practices on present social conditions, and on the conditions under which future generations will live; the treatment of animals, especially when its aim is human advantage; and the value of farming as a human activity in itself.

1 Basic justification

Some anti-agriculturalists defend a return to the life of hunting and gathering. Few philosophers have explicitly defended such a view, but it seems a logical consequence of some positions in environmental ethics. (Taylor 1986), for example, holds that all living things including plants have a *telos*, or 'goal', and that we have at least a corresponding *prima facie* duty not to interfere with them. Most humans could survive, and many could flourish, eating only nuts, berries and vegetable products taken from dead or dying plants. If all living things deserve respect then agriculture, the implements and practices of which are expressly designed to kill targeted plants and animals, might be unjustifiable. Callicott (1989) believes it is our duty genuinely to share the earth with other species, an impossibility when farmers plough up wildlife habitat (see Environmental ethics).

Two popular presentations of the anti-agricultural ideal make explicit its practical implications. In Edward Abbey's novel, *Desert Solitaire*, a character laments the oppressive presence of humans in the United States' Southwest, and opines, 'I'd rather shoot a man than a snake.' In Daniel Quinn's novel, *Ishmael*, a gorilla explains that the majority of humans are 'Takers', who have deprived the world of its wildness and diversity. The preferred form of human life from the gorilla's perspective is that of hunting and gathering in which 'Leavers', eschewing the arts of cultivation, ensure the integrity of nonhuman planetary life.

A more anti-humanistic philosophy seems hardly imaginable when, as Callicott puts it, the measure of a truly ecocentric ethic is the extent of its misanthropy. It would seem to be one of our basic duties, commensurate with others' basic moral rights, to endeavour to feed the world's hungry (see Development ethics; Justice, international). To abandon the arts of cultivation would result in our failing to meet this duty. The justification of the practice of agriculture is secured by whatever arguments justify the existence of the most basic of duties.

Many Jewish and Christian theologians formulate duties to nature in terms of stewardship, holding that the earth is a gift of God to humans so that we may use but not abuse soil, water, air and animals. Similarly, many secular philosophers believe that we are justified in cultivating the earth and breeding plants and animals selectively, if we do so in a sustainable way: the entitlement to treat plants and animals as things of instrumental value only is circumscribed by duties to future generations, humans who will need adequate natural resources to grow crops (see Future generations, obligations to).

2 Social justice

Concerns about fairness in the distribution of food and farmland have been raised in both developing and developed countries. Most of the world's poor are small tenant farmers. In order to increase the standard of living of these farmers, the governments of many developing countries adopted in the 1970s the policy of 'industrializing' agriculture; urging their farmers to copy the model of large successful farmers in developed countries. During the green revolution of the 1960s and 1970s, countries such as India, Costa Rica and Nigeria increased the efficiency of farmers' yields by borrowing money from international lending agencies such as the World Bank. The funds were used to extend credit to farmers, who were taught to buy high yielding varieties of seeds (such as rice, wheat, and maize) and to use the necessary accompanying technologies: mechanical implements (tractors) and synthetic chemicals (herbicides and pesticides). Many farmers flourished and nations that once imported grain became self-sufficient in certain crops.

Questions were raised, however, about the equity of the strategy. Critics alleged that industrial farming benefited larger farmers unfairly because they had easier access than small farmers to credit and expanded landholding. As crops were grown in greater abundance, the price farmers received for each bushel decreased and producers were forced to try to spread their costs over more acres. Were the poor and hungry actually disadvantaged by the industrialization of agriculture? Were small tenants dispossessed of land unjustly when larger farmers,

beneficiaries of the new technologies, bought up their smallholdings? Some argue that they were (Lappe and Collins 1979), others that they were not (Ruttan and Hayami 1984). The debate turns on the resolution not only of important empirical questions (for instance, did industrial agriculture reduce opportunities for labour employment and earnings?) but also of significant philosophical questions (for example, is it obligatory or supererogatory to aid unfortunates in other nations?).

In developed countries debate about social justice in agriculture sometimes takes as a focus the structure of the agricultural industry. In the United States, for example, the question has been expressed in terms of the desirability of 'saving the family farm'. Family farms are medium-sized businesses owned, worked and loved by families, the kind of farm being displaced by smaller hobby farms, on which the majority of income derives from off-farm activities, and by large super farms, often worked by hourly employees who are not stakeholders.

Questions to be addressed here include: Do family farmers practice better stewardship of the land than other farmers? Are rural communities better places to live if they are surrounded by many medium-sized farms rather than a few large farms? Are farm animals treated more humanely on family farms? Can smaller farms take advantage of economies of scale and produce food as efficiently as larger farms?

Another issue concerns the role of governments in agriculture. Should public policy target benefits and subsidies at medium-sized farms, and not at hobby or super farms? Or are such policies inherently unfair in so far as they do not benefit all farms equally?

Finally there are social justice questions related to pesticides and farmworker and consumer health. It has been argued on deontological grounds, for example, that farmers are morally unjustified in using chemicals that are carcinogenic to consumers (see Risk).

3 Nonhuman animals

Perhaps the most controversial matter in contemporary agricultural ethics concerns the moral standing of nonhuman animals. Some, such as Regan (1983), argue that it is morally wrong to raise and slaughter animals for food because farm animals typically are 'subjects of a life' with intrinsic value and basic moral rights of their own. Others argue that animals lack moral rights because they lack conscious experiences, moral autonomy and a sense of justice, and that it is therefore permissible to use cows and chickens in humane ways (see Moral standing; Animals and ethics). Utilitarians generally believe that animal pain counts morally, but they differ over whether the benefits of using animals in agriculture outweigh the costs. The issue gains urgency with the development of powerful new scientific techniques to manipulate the animal genome (see Genetics and ethics §3). As subjects of genetic engineering, farm animals have suffered from unintended deleterious effects, while research animals have suffered the consequences of being intentionally bred for propensity to develop debilitating diseases.

4 Virtue

If we believe Xenophon in the *Oeconomicus*, Socrates once said that 'the best kind of work and the best kind of knowledge is farming, by which human beings supply themselves with necessary things'. While some believe that the past ten thousand years of agriculture has led inevitably to irreversible catastrophic environmental degradation, many affirm with Xenophon's Socrates that there is no better work or knowledge than farming. What did Socrates mean by the idea that farming provides the best kind of knowledge? Perhaps he meant what Wendell Berry meant when he wrote that it is 'a law' that

> land that is in human use must be lovingly used; it requires intimate knowledge, attention, and care…. A family that has farmed a farm through two or three generations will possess not just the land but a remembered history of its mistakes and of the remedies of those mistakes.
>
> (1987: 349)

Why should such knowledge be 'the best kind'? Perhaps because in it the intellect is uniquely connected with the body, and spirituality to physicality. As Berry puts it, those who farm 'gain the means of life; … they gain the longevity and dependability of sources of food, both natural and cultural. [On a farm] the proper answer to the spiritual calling becomes, in turn, the proper fulfilment of physical need' (1987: 351).

To farm may be to practice a virtuous calling, an art with its own intrinsic rewards (see Virtue ethics). For a people

to become landless, or to become utterly dissociated from the means by which their most basic physical needs are met, may mean they are destined to become bereft not only of the best kind of work, but of the best kind of knowledge as well.

Agrippa (1st/2nd century AD)

Agrippa, a Sceptic of the first or second century AD, compiled five general modes of Sceptical argument: the views of positive theorists are subject to endemic disagreement due to the relativity of appearances, and adjudication cannot succeed, since it will either be mere assertion (and hence will not command assent) or appeal to further considerations, which process will either be infinitely regressive or circular, or terminate in unfounded assumption.

Agrippa is mentioned only once in our sources (Diogenes Laertius, IX 88), where no information is given about him beyond the attribution to him (and his associates) of a set of five modes with which to commend Pyrrhonian Scepticism (see Pyrrhonism). Sextus Empiricus ascribes these modes only to 'the more recent Sceptics' (*Outlines of Pyrrhonism* I 164), with no mention of Agrippa at all; nor does Agrippa's name figure in the list of prominent Pyrrhonians with which Diogenes Laertius closes his life of Pyrrho (IX 115-16).

The basic argument schemata of Pyrrhonism - Aenesidemus' ten modes (see Aenesidemus; Pyrrhonism §2) - collect different types of cases of opposing appearances of one sort or another, and move from the relativity of appearances (and the impossibility of favouring one set over another) to suspension of judgment about the natures of things, although they are less clear as to quite how suspension is to be achieved. The Agrippan modes organize the Sceptical material rather differently, and remedy that last deficiency. The first is that 'according to which we find that an undecidable conflict has arisen among both lay people and philosophers concerning the matter in hand as a result of which, being unable either to accept or reject it, we end up suspending judgment' (*Outlines of Pyrrhonism* I 165). The third asserts that appearances are in general irremediably relative, which is responsible for the dispute in the first place.

By contrast, the remaining modes are general and methodological, designed to undermine the attempts of dogmatists to offer reasoned defences of their positions. The second mode is that of regress: each supposed justification of a position will itself require justification, and so on *ad infinitum*; but such a sequence offers no ultimate justification at all, and again suspension follows. Dogmatists may sometimes simply offer unargued assumptions, or hypotheses, but these are not compelling since in any case we might equally assume the opposite; this forms the basis of the fourth mode (*Outlines of Pyrrhonism* I 173-4). Finally dogmatists will sometimes attempt, whether wittingly or not, to show that their suppositions are reciprocally supporting; but, as the fifth mode demonstrates, if *p* rests on *q* and *q* upon *p*, then neither rests upon anything.

These modes may be (and generally are) deployed in combination against any dogmatist's claim to have established a criterion which might distinguish truth from falsity and thus provide foundations for knowledge (see Pyrrhonism §4). Suppose a dogmatist asserts that *p*. If that is a mere assertion, then the Sceptic produces the fourth mode. If *p* is in turn supported by *q*, and *q* by *r*, and so on, either that procedure terminates somewhere (in which case the fourth mode again becomes operable); or it does not, committing the dogmatist to regress; or, eventually one of the supporting propositions is itself shown to rest on *p*, in which case, as the fifth mode has it, the whole structure is built on sand.

The Agrippan modes are weapons of great scope and power; and Sextus' presentation of the Ten Modes of Scepticism was evidently influenced by them. Indeed, the whole subsequent history of the epistemology of justification may be seen as a series of attempts to evade their purportedly all embracing grasp.

Agrippa von Nettesheim, Henricus Cornelius (1486-1535)

Famous in the sixteenth century for writings in which he steps forward variously as magician, occultist, evangelical humanist and philosopher, Agrippa shared with other humanist writers a thoroughgoing contempt for the philosophy of the scholastics. In his more evangelical moods Agrippa could be taken for a radical exponent of the philosophia Christi *of his older contemporary Erasmus, or mistaken for a follower of Luther, whose early writings he actively disseminated in humanist circles. However, his deepest affinities are with magically inflected philosophies: the Neoplatonism and Hermetism of Marsilio Ficino, and the syncretic Christian Kabbalah of Giovanni Pico della Mirandola, Johannes Reuchlin and Johannes Trithemius.*

As well as expounding an influential magical view of language, Agrippa contributed to the sixteenth-century revival of scepticism, denounced the 'tyranny' of those who obstructed a free search for truth, criticized the subjection of women and (with a courage unusual in his time) resisted and mocked the instigators of the witch-craze. Finding in Hermetic-Kabbalistic doctrines the inner truth both of religion and of philosophy, Agrippa was also aware of parallels between these magical doctrines and the Gnostic heresies. His heterodoxy made him a target for pious slanders: within several decades of his death he became the protagonist of demonological fictions which were soon absorbed into the legend of Dr Faustus.

1 Life

Born to a family of the lesser nobility in Cologne (from whose Latin name, Colonia Agrippina, he drew his humanist cognomen), Agrippa took his first degree at Cologne in 1502; after further studies in Paris and elsewhere, he claimed to have doctorates in canon law, civil law and medicine - and also to have been knighted in recognition of military service.

In 1508 he took part in an unsuccessful military adventure which a secret occultist society, of which he was a member, undertook in Spain, possibly at the behest of Emperor Maximilian I. Members of this society subsequently became prominent in French humanist and court circles, providing Agrippa with a network of supporters upon whom, as his reputation for encyclopedic learning grew, he was able to draw in his searches for patronage. When in 1509 he lectured on Reuchlin's Kabbalist philosophy at the University of Dôle in Franche-Comté and wrote *De nobilitate* (published in 1532), Agrippa had hopes of preferment in the court of Margaret of Austria, Regent of Franche-Comté and the Low Countries. These were dashed when he was denounced at court by a prominent Franciscan as a 'judaizing heretic'. Returning to Germany, in 1510 he completed the first version of *De occulta philosophia* (published in 1533), and in the same year travelled to England, apparently in the service of Maximilian I.

For the first several years of his Italian sojourn, which lasted from 1511 to 1518, Agrippa continued to serve the emperor both as diplomat and soldier. But by 1515 he was lecturing on the *Hermetica* at the University of Pavia - a position which he promptly lost, along with his library and other possessions, after the French victory at Marignano. In 1518 Agrippa moved north again, taking up a position as city orator and advocate in Metz. Intervening there in the case of a woman accused of witchcraft, he secured her freedom, recovered her property, and accused the inquisitor responsible for torturing her of heresy. But this and other instances of resistance to tyranny and obscurantism made him unpopular with the orthodox. He returned to Cologne in 1520, lived from 1521 to 1523 in Geneva (where he was at the centre of a group of reforming tendencies), and then moved to Fribourg (also in Switzerland), where he practised medicine.

In 1524 Agrippa secured a place in the French royal court at Lyons as personal physician to the queen mother, Louise de Savoy. But by 1526 he was in trouble, having rashly revealed his sympathy for the rebellious Duc de Bourbon and Emperor Charles V, who was at war with King Francis I. During the same year Agrippa wrote *De vanitate* (published in 1530), which includes a vehement critique of the corruption and venality of court life. Perhaps as a result, his salary was withheld, while at the same time he was refused permission to leave the court.

Dismissed at last in 1528, Agrippa obtained a place in the court of Margaret of Austria at Antwerp as historiographer to Emperor Charles V. But when Margaret died in late 1530 he was again unable to secure payment for his services. Furthermore, the printing of *De vanitate* in 1530 had earned him condemnation from the

theological faculties of Paris and Louvain, which led to difficulties with the imperial privy council. In 1531 the printing of a much expanded version of *De occulta philosophia* in Antwerp was blocked after the first of its three books had been printed; two years later, thanks to the patronage of the reform-minded Archbishop of Cologne, Agrippa was able to see this book and several others, including *De nobilitate* and a commentary on the art of Ramon Llull, through the press.

Returning in 1535 to Lyons, Agrippa was imprisoned by Francis I for having written against Louise de Savoy. Released through the intervention of friends, he died shortly afterwards in Grenoble.

2 Verbal magic

Agrippa derived from the Neoplatonists (and ultimately of course from Plato's *Cratylus*) the view that the power inherent in natural things lives on and is latent in 'the form of the signification' (1533: I.lxx). Because the hidden powers of things proceed in the first place from celestial causes, and because the celestial powers which move the elemental world, acting from circumference to centre, originate with 'the word of God, which word the wise Chaldeans of Babylon call the cause of causes' (1533: II.lx), it follows that the philosopher or magician whose words can draw upon the power of this originary creative Word should be able to intervene powerfully in the natural order. Agrippa's insistence on the purely natural quality of verbal magic cannot disguise the heterodox implication of this view of language, which is that the magician can get in at the top of the hierarchical structure of the cosmos because his 'mysterious words' and 'ingenious speech' draw upon the power contained within God's Word - a term which refers to the canonical scriptures as well as to Christ, the creative Logos (see Language, Renaissance philosophy of).

3 Agrippa as sceptic and free-thinker

The main purpose of *De vanitate* (1530) is to bring the reader to a position of Christian fideism (though one in which Christian faith is thoroughly infused with Hermetic and Kabbalistic motifs). To this end Agrippa's chapter on logic makes a brief but effective deployment of sceptical arguments. Aristotle's principles of demonstration (see Aristotle §6), he argues, require an understanding of causes and principles to which we give our assent on the basis either of authority or of sense-based experience (for knowledge is agreed to arise from the senses, and Averroes (Ibn Rushd) makes agreement with sensible things a criterion of truth) (see Ibn Rushd §6). But the senses are often deceived, and furthermore cannot attain the intellectual level at which we encounter the causes of lower things. It is therefore manifest that 'the way of the truth is shut up from the senses', and that sciences rooted in them are 'uncertain, erroneous and deceitful' (1530: cap. 7). Appeals to authority are no more acceptable, since the final recourse of the scholastics against those who deny the first principles of their sciences is to violence, 'so that of philosophers they are made torturers and hangmen, since they will compel us by force to confess that which they should teach by reason' (1530: cap. 1) (see Scepticism, Renaissance §2).

4 Agrippa as feminist

In *De nobilitate* (1532) Agrippa argues that 'between man and woman by the substance of the soul one has no higher pre-eminence of nobility above the other, but both have by nature equal liberty of worthiness. Yet in all other respects, apart from the divine substance of the soul, the excellence and nobility of womankind surpasses beyond limit the rude gross nature of men' (*Opera*: sig. Ii 4v). Some of the examples with which he develops this claim are deliberately frivolous, and yet he does insistently challenge the misogynist legal culture by which women, 'being subdued as it were by force of arms, are constrained to give place to men, and to obey their subduers, not by any natural or divine necessity or reason, but by custom, education, fortune, and a certain tyrannical occasion' (*Opera*: sig. Ll 3v). François Rabelais' portrait of Agrippa as Her Trippa, an occultist who is ready to predict Panurge's cuckoldry by all the magical arts at his disposal, while remaining unaware that the court lackeys are lining up to frolic with his own wife, can be understood as a sardonic response to Agrippa's feminism (see Rabelais, F. §3). A more positive response is evident in Johannes Wier's *De praestigiis daemonum (Of Demonic Deceptions)* (1563), a book which in some parts of western Europe had a moderating effect upon the witch-hunts of the time: Wier, who had been Agrippa's student, adopted his opinion that the elderly women who were the prime targets of the witch-hunters were suffering from melancholia rather than demonic possession, and that Christians should give them spiritual and material comfort rather than persecuting and torturing them (see Feminism §2).

5 Agrippa's philosophical influence

The apparent contradiction between the sceptical fideism of *De vanitate* and the encyclopedic syncretism of *De occulta philosophia* is to some extent dissipated by Agrippa's reliance in both books upon a Hermetic-Kabbalistic doctrine of spiritual rebirth and deification. However, Agrippa is neither a coherent nor in most respects an original thinker. His most strongly voiced opinions are often taken verbatim from the works of Marsilio Ficino, Giovanni Pico della Mirandola and Johannes Reuchlin, and since he typically appears more interested in assembling diverse opinions on a subject than in assessing their relative truth, his own impulses may seem more antiquarian than philosophical. (Given the hostility he encountered from theologians of the mendicant orders from 1509 onwards, one may suspect that he was content to allow the material he had assembled to work within the reader's mind, without himself taking the risk of underlining its heterodox implications.)

Agrippa was widely read for well over a century after his death. He was, on the one hand, denounced by John Calvin in *De scandalis (On Scandal)* (1550) as a mocker of sacred truths in the vein of Lucian of Samosata, by Jean Bodin in *De la démonomanie des sorciers (On the Devil-mania of Sorcerers)* (1581) as the leading sorcerer of his age, and by André Thevet in *Les vrais pourtraits et vies des hommes illustres (The True Portraits and Lives of Illustrious Men)* (1584) as having spawned hordes both of scoffers and magicians. On the other hand, his works were cited and echoed by literary figures ranging from Jean de la Taille to Sir Philip Sidney, Fulke Greville, Christopher Marlowe and Thomas Nashe, as well as by occult philosophers from John Dee and Giordano Bruno to Thomas Vaughan. Moreover, Michel de Montaigne's scepticism, which represents man as 'naked and empty, acknowledging his natural weakness, apt to receive from above some strange power, disfurnished of human knowledge, and so much the more fit to harbour divine understanding, nullifying his judgment so as to give more place to faith' ([1580] 1962 (1): 562), is clearly indebted to Agrippa's *De vanitate* (see Montaigne, M. de §3). Perhaps more significantly, it has recently been argued that René Descartes' writings, from the early *Olympica (Revelation from Olympus)* and *Cogitationes privatae (Private Thoughts)* (1619-21) to the *Meditations* (1641), make sustained use of motifs derived from the philosophical *Hermetica*, and that Descartes' understanding of the Hermetic writings was conditioned by his early reading of Agrippa (see Keefer 1996).

MICHAEL H. KEEFER

List of works

Agrippa, H.C. (1486-1535) *Opera (Works)*, Lyons, *c.*1600, 2 vols; facsimile repr. ed. R.H. Popkin, Hildesheim and New York: Olms, 1970.(The most easily accessible collection of Agrippa's writings - though in Latin.)

Agrippa, H.C. (1530) *De incertitudine et vanitate scientiarum et artium atque excellentia verbi dei declamatio*, Cologne; trans. J. Sanford, *Of the Vanitie and Uncertaintie of Artes and Sciences*, London, 1569; repr. ed. C.M. Dunn, Northridge, CA: California State University Press, 1974.(Agrippa's most sustained piece of satirical and polemical writing, this work was frequently reprinted and widely quoted - by, among others, later sixteenth-century religious radicals.)

Agrippa, H.C. (1532) *De nobilitate et praecellentia foeminei sexus*, Cologne; repr. in R.H. Popkin (ed.) *Opera*, vol. 2, Hildesheim and New York: Olms, 1970; trans. T. Clapham, *Of the Nobilitie and Excellencie of Womankynde*, London, 1542.(An important early expression of male feminism; the English translation of this book has been described as 'the most explicitly feminist text to be published in England in the first half of the [sixteenth] century' (Jordan 1990: 122).)

Agrippa, H.C. (1533) *De occulta philosophia libri tres*, Cologne; trans. J. Freake, *Three Books of Occult Philosophy*, London, 1651; repr., ed. D. Tyson, St Paul, MN: Llewellyn Publications, 1993.(The best-known Renaissance encyclopedia of learned magic, this book effectively de-centres orthodox Christianity through its explorations of parallels with Judaic, Muslim and pagan traditions.)

Ailly, Pierre d’ (1350-1420)

D’Ailly was a prolific writer on a number of subjects. His best known philosophical works concentrate on logic and on faith and reason, with strong influences from Ockham in particular. He also wrote influential works on the nature of the soul. He was one of the most eminent partisans of the late medieval nominalist movement and was numbered among the foremost doctores renovatores *by King Louis XI in his decree against the nominalists. His works continued to be highly influential as late as the Reformation period.*

Pierre d’Ailly, rector of the Collège de Navarre, chancellor of the University of Paris, bishop of Le Puy and Cambrai, cardinal and papal legate to Germany, was a man of wide interests and inexhaustible energy. He wrote a great number of treatises on the most varied subjects, besides performing the many duties associated with his ecclesiastical and secular posts. He left behind over one hundred and seventy works; those devoted to purely philosophical matters are few in number and were all written in the early years of his academic career, while he was teaching philosophy at the Collège de Navarre. The largest group of his works is devoted to matters relating to the Great Schism (during which there were two, or even three, popes) which endured for almost forty years. After the beginning of the Schism in 1378, d’Ailly concentrated on finding a way to terminate this *horrenda monstruosaque divisio* (abhorrent and monstrous division) and was completely distracted from philosophy.

His influences were widespread and lasting. Martin Luther was substantially influenced by d’Ailly’s theory of the Eucharist (developed in the fourth book of his *Commentary on the Sentences*, written in 1376-7). In his own treatise *De captivitate Babylonica ecclesiae (The Babylonian Captivity of the Church)*, Luther recalls:

> Once, during my study of scholastic theology, Pierre d’Ailly gave me occasion to think (while I was reading his fourth book on the Sentences, where he argues most acutely) that it would be much more probable, and one would need fewer of those superfluous miracles, if one would affirm that on the altar there were real bread and real wine, not just their attributes - if the Church had not determined the opposite. When I later realized which Church it was that had determined this - the Thomistic Church, to be sure - I became more courageous.
>
> (*De captivitate Babylonica ecclesiae*)

Christopher Columbus owned d’Ailly’s geographical works *Imago mundi (The Appearance of the World)* and *Epilogus mappae mundi (Epilogue on the Map of the World)*, both written in 1410. They influenced Columbus in his search for a shorter sea route to India and consequent discovery of America; of the authors Columbus had studied, it was d’Ailly whom he preferred to quote. Nicholas of Cusa used d’Ailly’s *Exhortatio super kalendarii correctione (On Corrections to the Calendar)*, written in 1411 for Pope John XIII and later publicly read at the Council of Constance, for his own treatise *De correctione kalendarii*. In his *Exhortatio*, d’Ailly advocated - in vain - the reform of the calendar that was later successfully promulgated by Pope Gregory XIII. Johannes Kepler, himself an apologist for a reformed astrology, explicitly refers to d’Ailly’s astrological works in his treatise *De stella nova in pede Serpentarii (The New Star in the Foot of the Serpent)*; in one of those works, the *Elucidarium astronomicae concordiae cum theologica et historica veritate (On the Concordance of Astronomy with Theology and Historical Truth)*, written in 1414, one finds the first mention of d’Ailly’s famous prediction of the French Revolution, which he repeated in his treatise *De persecutionibus ecclesiae (The Persecutions of the Church)*.

Much of fourteenth-century thought is characterized by a desire to disengage faith from reason and to build upon empirical facts rather than metaphysical assumptions. Thus, it is not by chance that two of d’Ailly’s favourite phrases in his philosophical writings are *docet experientia* (experience teaches) and *patet inductive* (this is clear on the basis of induction). His main sources are William of Ockham, Thomas Bradwardine, Gregory of Rimini and John Buridan, among whom Ockham is clearly the foremost authority: ‘a few things said by him I value more highly than many volumes by certain others’ (*Tractatus de consolatione philosophiae Boethii*, q.1, art.4: 132).

Pierre d’Ailly’s logical writings - *Conceptus (Concepts)*, *Insolubilia (Insolubles)*, *Exponibilia (Exponible Propositions)* and *Destructiones modorum significandi (Attacks on the Modes of Signifying)* (of dubious attribution) - were very influential in the later Middle Ages and through the fifteenth century. D’Ailly adheres to the Ockhamist tradition in basing his logical theories on the notion of mental language. Concerning paradoxes of self-reference (*insolubilia*), for instance, he holds that there are none in mental language, and that spoken or

written paradoxes of this sort are ambiguous sentences in so far as they correspond to two distinct mental sentences, one true and the other false (see Language, medieval theories of §§2, 3, 14). It is worth noting that the term *vitalis immutatio* (vital change) plays an important role in d'Ailly's definitions of central logical terms such as *conceptus* and *significatio*, which are thus closely connected with his theory of the soul and its powers.

His *Tractatus de anima (Treatise on the Soul)*, certainly one of the most important systematic works on philosophical psychology written in the fourteenth century, was widely read throughout the fourteenth, fifteenth and sixteenth centuries. Gabriel Biel wrote a valuable commentary on it. The first chapter deals with the definition of the soul and its tripartite division, chapters 2-8 deal with the powers of the vegetative, sensitive and intellective soul, while the concluding seven chapters deal with the accidents of the soul: species, the acts of sensation, intellection, volition and passion, and habits. D'Ailly's definition of the soul deviates from Aristotle's formulation: 'The soul is the substantial form of a living body that has within it the capacity to carry out vital activities'. This definition of the soul was adopted by other late medieval authors such as Symphorien Champier (see Soul, nature and immortality of).

D'Ailly's *Tractatus super De consolatione philosophiae Boethii (Treatise on Boethius' Consolation of Philosophy)* is mainly devoted to the theory of human happiness. Whether a human being can be called 'truly happy in this life' was one of the central ethical questions in the Buridanist school, where the term *homo felicitabilis* (the human being with a capacity for happiness) was coined. In this context, d'Ailly also discusses the question of immortality. In *Tractatus de anima*, he had followed Buridan in affirming that if one follows human reason alone, then Alexander of Aphrodisias' theory of the soul - that the human soul is 'drawn from matter's potentiality' and hence mortal - is the most probable (see Alexander of Aphrodisias). But in *Tractatus de anima*, he strongly opposes Alexander and, while relying heavily on arguments taken from ancient authorities like Cicero and Seneca, sides with Nicole Oresme in declaring that even 'in accord with the light of nature', the immortality of the soul is more probable.

Ajdukiewicz, Kazimierz (1890-1963)

Ajdukiewicz, like other typical members of the Lwów-Warsaw School, the main Polish analytic movement, was basically interested in logic, philosophy of language, epistemology, and philosophy of science. In the 1930s, he proposed a form of radical conventionalism, an extension of the conventionalism of Duhem and Poincaré. Later, he rejected this radical conventionalism in favour of a semantic epistemology. In the philosophy of science he tried to build a general theory of fallible inferences based on decision theory. Ajdukiewicz's most important contribution to logic is his formal notation for syntactic categories.

1 Life

Ajdukiewicz was born on 12 December 1890 in Tarnopol, a town in the Austro-Hungarian Empire (now in Ukraine). In 1908-12 he studied philosophy at the University of Lwów, mainly under Kazimierz Twardowski. He was also trained by Jan Łukasiewicz in logic and Wacław Sierpiński in mathematics. In 1912 he obtained his Ph.D.; his dissertation concerned Kant's theory of space. In 1913 Ajdukiewicz studied in Göttingen where he attended courses given by David Hilbert and Edmund Husserl. He obtained his *Habilitation* degree from the University of Warsaw with a dissertation on the foundations of mathematics. In 1921-6 he was an associate professor (docent) at the University of Lwów. In 1926 he was appointed as professor of philosophy at the University of Warsaw. In 1928 he returned to Lwów, where he was given a professorship. During the Second World War he lived in Lwów and taught in clandestine Polish schools. In 1945 Ajdukiewicz accepted a professorship at the University of Poznan. In 1955 he moved to the University of Warsaw. He died on 12 April 1963 in Warsaw.

2 Radical conventionalism

Radical conventionalism is closely related to Ajdukiewicz's theory of language and meaning. The meanings of expressions in a language generate rules for accepting sentences of *L*. Ajdukiewicz singles out three kinds of meaning-rules: axiomatic (they require the unconditional acceptance of certain sentences, for example '*A* is *A*'), deductive (for example, *B* follows from 'if *A* then *B*' and *A*), and empirical (the sentence 'snow is white' is asserted in a situation in which a person asserting this sentence perceives that snow is white).

It follows from the foregoing explanations that meanings determine meaning-rules. But in general, meaning-rules do not determine the meanings of expressions; this holds, for example, for ordinary language. However, the situation radically changes when we pass to closed and connected languages. Roughly speaking, a language *L* is open if it can be extended to a new language L' without changes in the meanings of the expressions of *L*; otherwise, *L* is closed. A language *L* is disconnected if there is a non-empty subset *X* of expressions of *L* such that no element of *X* is related by meaning-rules of *L* to its remaining expressions; otherwise, *L* is connected. An important consequence of the theory of closed and connected languages is this: if *L* is a closed and connected language, it is impossible to enrich *L* by new expressions in such a way that old meanings are preserved.

For Ajdukiewicz, mature, particularly scientific, knowledge is expressed in closed and connected languages. The set of meanings of a closed and connected language *L* is its conceptual apparatus. From general theorems on closed and connected languages, one can infer that two conceptual apparatuses are either identical or mutually non-translatable. The acceptance or rejection of sentences is always related to a definite language *L*. If *L* is closed and connected, empirical situations do not force us either to accept or reject any sentence, because we can always change our conceptual apparatus. This is an essential strengthening of usual conventionalism. For Poincaré and Duhem, we are free to change our theoretical principles, because they are hidden conventions. For Ajdukiewicz, experiential reports are also closely related to conceptual apparatus, and since every conceptual apparatus produces a world-perspective, we can say that theories and observational reports are accepted not absolutely but relative to world-perspectives. This is why Ajdukiewicz called his conventionalism 'radical', contrary to the moderate view of the Frenchmen (see Conventionalism).

3 Semantic epistemology

In the middle 1930s Ajdukiewicz rejected radical conventionalism, because he came to the view that his idea of

connected and closed languages was a ‘paper fiction’. The change was also strongly motivated by the work of Tarski which convinced many philosophers that semantics has important applications in philosophy. When he was a radical conventionalist, Ajdukiewicz did not draw any ontological theses from his epistemological considerations; but his semantic epistemology is an attempt to bring together epistemology and ontology. If we speak about the world, we use an object-language. Since epistemology intends to say something about the world and our knowledge of it, an epistemologist must use a meta-language in order to capture knowledge and its object. Ajdukiewicz, employing metalogic and semantics, gave a rigorous analysis of Rickert’s transcendental idealism and Berkeley’s subjective idealism (see Berkeley, G.). For Ajdukiewicz, both kinds of idealism are incorrect, because they neglect basic results of metalogic and semantics. Ajdukiewicz rejects Rickert’s idealism, because truth, contrary to Rickert, cannot be established exclusively by purely deductive procedures; the incompleteness of arithmetic is an essential premise of Ajdukiewicz’s argument. Berkeley’s thesis that ordinary objects are complexes of our ideas is rejected, because it conflates syntax and semantics. According to Ajdukiewicz, Berkeley uses a language which is very similar to the language of syntax and offers a syntactic-like definition of existence. However, since existence is basically a semantic concept and semantics is not fully definable in syntax, Berkeley’s argument fails. Thus, semantic epistemology leads to a realist account of existence.

4 Philosophy of science

In addition to his discussions of radical conventionalism, which implies that there is no absolute gap between theories and experiential reports, Ajdukiewicz also worked on concrete problems in the philosophy of science. In particular, he was interested in the logic of fallible inferences. His approach was based on concepts borrowed from decision theory. In general, acceptances (rejections) of sentences are actions which are associated with profits and losses. Assume that A is a sentence to be accepted and that Z is the minimal acceptable profit for the agent, when A is true, and S is the minimal acceptable loss, when A is false. According to Ajdukiewicz the ratio $S/(S+Z)$ expresses the degree of certainty which an agent accepting A can ascribe to this sentence. This relates degrees of certainty to mathematical probabilities. Having this framework, Ajdukiewicz tried to establish the degree of conclusiveness of a fallible scheme of inference. Assume that K is background knowledge. We are interested in the degree of conclusiveness of a fallible (for example, inductive) inference from premises P to a hypothesis H. This inference is conclusive if the degree of certainty of H does not exceed the ratio of its initial probability to the initial probability of premises, relative to K. Ajdukiewicz’s analysis of fallible inferences is a typical example of his pragmatic approach to methodological problems, which consists in relating analysed concepts to attitudes of epistemic agents.

5 Contributions to logic

Ajdukiewicz’s notation for syntactic categories is his main contribution to logic. The following example shows how this notation works. We have two basic categories: sentences (s) and terms (n). Now, consider an expression ‘is tall’. It forms a sentence together with a term, for example ‘Tom’. We ascribe to ‘is tall’ the symbol s/n which informs us that ‘is tall’ is a function forming a sentence with a term as an argument. Now we build a sequence of symbols for the sentence ‘Tom is tall’. The sequence is this: n, sn. It is obtained by writing the symbols for the categories of all the expressions occurring in the considered sentence. We can simplify the sequence by performing ‘arithmetical’ operations on symbols by analogy with operations on ratios. Thus, we can ‘shorten’ $\{n, s/n\}$ by dividing both members by n; we assume that n/n can be cancelled. Thus, we obtain s as the sole member. A general rule is this: if the simplification ends with n or s, the original expression is syntactically correct; otherwise not. This idea gave rise to constructions known as Leśniewski-Ajdukiewicz-Lambek grammar, originated with Leśniewski, continued by Ajdukiewicz, and fully developed by Lambek (see Syntax).

Akan philosophical psychology

The word Akan *refers to the Twi-speaking people of southern and central Ghana. Akan traditional philosophy is essentially a philosophy of the person. It has cosmological ramifications, but the basic concepts emerge from the analysis of the human personality. That analysis is extremely sensitive to the complexity of the human psyche and the social dimensions of individual consciousness. These considerations explain and justify the prominent position occupied by the concept of a person in contemporary Akan philosophy.*

This emphasis on the person is a time-honoured feature of the written tradition of Akan philosophy and reflects the priorities of the oral tradition, the mainspring of that system of thought. With respect to the nature of personhood, however, there has been a divergence of preoccupation between the oral and the written traditions. The predominant motivation of the written tradition has been metaphysical, as writers have sought to clarify the ontological status of the constituents of human personality, while the main orientation of the oral tradition is social and ethical. Within this tradition, a person is defined by their social relations more crucially than by their ontological essence.

In the Akan tradition the concept of a person has a normative as well as a descriptive component. The word *onipa*, the Akan equivalent of 'person', is often used normatively to designate a person who has largely attained a desirable social standing. To achieve a high degree of personhood is therefore an inherent part of the Akan ethic. To be a person in the fullest sense is to be an adult who works hard, thinks judiciously and is able to support a conjugal household as well as fulfil a range of obligations to an extended group of kinfolk and to the civic community at large. Such an individual, also known as an *obadwenma*, meaning someone of ethical and cerebral maturity, must also listen to and act in accordance with their conscience, known as *tiboa*, or literally, animal in the head (*ti* meaning head and (*a*)*boa* meaning animal).

In Akan circles to talk or act unintelligently is to risk unflattering descriptions of the *adwene* in your head. *Adwene*, or mind, is the noun form of the verb *dwen*, to think. The term denotes mental processes and emotional dispositions. The Akans delight in metaphor and often locate the mind in the head as if it is identical with the brain, or *amene*. Indeed, there is little temptation to identify the mind with the brain or with any other kind of substance, physical, abstract or spiritual.

Because the Akans traditionally do not conceive of the mind as a kind of substance, they do not include it in their ontological inventory of the elements which constitute an *onipa*, or person, in the minimal sense of a human being. Within the oral and written traditions there is near unanimity that a person in Akan traditional thought consists of *ornipadua*, literally the tree of a person, deriving from the *mogya*, or blood of the mother in combination with the *okra*, the animating element which emanates directly from the supreme being. The factor that completes the equation that yields a person is the *sunsum* which originates from the father's input in conception and is held to be responsible for the unique personal presence of every individual. All *akra* (plural of okra) are identical in nature in as much as they are all particles of the divine substance, but they are individuated by the unique destinies prenatally assigned to them by the supreme being. In view of this common divine element, all human beings whatever their social achievements or failures, are regarded as children of God each with the gift of immortality. (A famous Akan adage holds that everyone is the child of God; no one is a child of the earth.)

The *okra* and the *sunsum* cannot be identified with the soul or spirit contrary to frequent practice in Akan literature, as in the general cosmology of the Akans, all these entities are conceived in quasi-material terms. However, this and other issues in the interpretation and evaluation of the Akan concept of a person, remain matters of controversy among Akan philosophers.

Akrasia

The Greek word 'akrasia' *is usually said to translate literally as 'lack of self-control', but it has come to be used as a general term for the phenomenon known as weakness of will, or incontinence, the disposition to act contrary to one's own considered judgment about what it is best to do. Since one variety of* akrasia *is the inability to act as one thinks right,* akrasia *is obviously important to the moral philosopher, but it is also frequently discussed in the context of philosophy of action.* Akrasia *is of interest to philosophers of action because although it seems clear that it does occur - that people often do act in ways which they believe to be contrary to their own best interests, moral principles or long-term goals - it also seems to follow from certain apparently plausible views about intentional action that* akrasia *is simply not possible. A famous version of the suggestion that genuine* akrasia *cannot exist is found in Socrates, as portrayed by Plato in the* Protagoras*. Socrates argues that it is impossible for a person's knowledge of what is best to be overcome by such things as the desire for pleasure - that one cannot choose a course of action which one knows full well to be less good than some alternative known to be available. Anyone who chooses to do something which is in fact worse than something they know they could have done instead, must, according to Socrates, have wrongly judged the relative values of the actions.*

1 The Socratic view

The Socratic view that 'no one does wrong willingly' receives its most detailed elaboration in the *Protagoras*. The context is a discussion between Socrates and Protagoras about the nature of the virtues. It is in the course of defending the suggestion that the virtues form a kind of unity that Socrates maintains that no one can knowingly choose the worse of two available alternatives.

There is much controversy about how, exactly, Socrates' argument for his conclusion is to be understood. The argument certainly appears to invoke some highly questionable assumptions about the relationship between pleasure and pain and goodness and evil, and between all of these and human motivation; and there has been much debate about whether we ought to regard these assumptions as ones which Socrates himself accepted, or whether he is rather arguing *ad hominem* against those who do accept the hedonistic views on which his argument seems to be based. Protagoras and Socrates declare themselves straightforwardly agreed on the point that knowledge cannot be 'pushed around by all the other affections' (352c1) (that is, that if someone knows which is the best course of action, then nothing can persuade them to act otherwise than as that knowledge dictates). The argument is thus presented as an attempt to convince not Protagoras, but rather those ordinary people who have not realised that there is really no such phenomenon as being induced to act contrary to one's knowledge by the desire for pleasure. This may leave room, therefore, for the view that the premises on which Socrates' argument are based are not ones he himself believed, but rather are assumptions that he attributes to these hypothetical interlocutors.

With this caution in mind, we can say that the structure of the argument is something like this:

(1) The evaluation of actions is always based, ultimately, on judgments about the total amounts of pleasure and pain which will result, overall, from performing them.
(2) Since this is so, the good and the pleasant are (in some sense or other) the same, and similarly for the bad and the painful.
(3) This means that any description of an agent which involves their being said to be 'overcome by pleasure' can be replaced by a description of that agent as 'overcome by the good'. But the good by which the agent is overcome cannot, by hypothesis, outweigh the evil which will result from the action (otherwise the action would be virtuous and the agent would have done nothing wrong).
(4) The agent who is 'overcome by pleasure', therefore, must be described as someone who chooses evil (pain) in exchange for a good (pleasure) which does not adequately compensate for this evil.
(5) But, in weighing pleasures and pains against one another, one must always choose what one believes to be the greater pleasure or the lesser pain - and one must therefore take whichever course of action it is that one believes will result, overall, in the most pleasant or least painful outcome, all things considered.
(6) So, the only possible explanation for someone's choosing an action which will bring more pain, overall, or less pleasure, than some alternative known to be available is that they have misjudged the total amounts of pleasures and pains to be got from the alternative actions.

Obviously, this argument is vulnerable to attack at many points. In particular, the psychological hedonism invoked in premise (5) might be challenged. There may be other reasons for thinking that there is something right about the Socratic view, but it seems fair to say that what we are offered in the *Protagoras* amounts to a less than conclusive case.

2 Aristotle on *akrasia*

Aristotle's views on *akrasia* receive their most extensive airing in Book VII of his *Nicomachean Ethics*, and the bulk of what he says is concentrated in a single chapter of that book, chapter 3. The text of this chapter, however, is dense and complex, and there is considerable disagreement amongst commentators even about the very basic question of whether Aristotle is to be seen as an apologist for the Socratic position or rather as a critic of its over-intellectualized view of the causes of practical error. Some translators (for example Ross 1980) have credited Aristotle with the straightforward assertion, early in his discussion at VII 2, that the Socratic view 'contradicts the plain phenomena' (1145b27), which clearly supports the second hypothesis; but since the Greek word 'phainomena' can also be translated 'common opinions or beliefs', this interpretation is not uncontroversial. And it must be admitted that a good deal of what Aristotle says in VII 3 appears to associate the occurrence of *akrasia* with a special kind of ignorance, an association reminiscent of the Socratic view that if one really knows what is best, one can do nothing else. Furthermore, the chapter ends with the claim that, in the light of what has been said, 'the position that Socrates sought to establish actually seems to result' (1147b14).

On the other hand, there are numerous passages in other of Aristotle's works where Aristotle appears to imply that it is perfectly possible for an agent to pursue an undesirable course of action while knowing full well that it is not the best thing to do. In the *Eudemian Ethics*, for example, it is said that to act incontinently 'is to act through appetite contrary to what the man thinks best' (1223b8-9), and that the *akrates* has 'a pain of expectation, thinking that he is doing ill' (1224b20-21). Then again, in *Magna Moralia*, we have the incontinent agent characterised as one 'who knows indeed from reason that he ought not [to do the wrong thing], but gives in to pleasure and succumbs to it' (1203b5-6). These quotations seem to suggest that Aristotle is perfectly content with the description of *akrasia* that Socrates sought to reject, the condition of one whose knowledge is vanquished, but not necessarily clouded or annihilated, by the desire for pleasure. How, then, are we to square these passages with the appearance that NE VII 3 endorses some version of the Socratic view?

There is not space here to review the many attempts that have been made to resolve the apparent contradiction. Certainly, though, VII 3 does make it seem as though Aristotle is inclined to deny that there can be such a thing as utterly clear-eyed *akrasia* - the calm, deliberate and intentional performance of an action known not to be in one's own best interests. The chapter is largely concerned with the application to the problem of *akrasia* of two distinctions, one rooted in Aristotle's doctrine of the practical syllogism, the other concerned with a contrast between the mere possession of knowledge and its *use* or *exercise*, and it is hard to see how these epistemic considerations are intended if not as qualified support for the Socratic view that knowledge cannot be 'dragged around like a slave'. The suggestion seems to be that passion or desire makes it impossible for the *akrates* to reach full-fledged knowledge of the conclusion of the practical syllogism which would lead him to perform the right action. But if so, Aristotle would seem to be in agreement with Socrates that weakness of will is never really just that - that it is always bound up with some form of self-deception, delusion or other epistemic error (see Aristotle §23).

3 Davidson on weakness of will

In a famous article entitled 'How is Weakness of the Will Possible?' (1970), Donald Davidson locates the problem of *akrasia* firmly within the philosophy of action, discarding its traditional connections with morality and the defeat of moral judgment by passions of various kinds. According to Davidson, an agent acts incontinently if and only if: (a) the agent does *x* intentionally; (b) the agent believes there is an alternative action *y* open to them; and (c) the agent judges that, all things considered, it would be better to do *y* than to do *x*. It follows that, for Davidson, there is not necessarily anything iniquitous about incontinence. He gives the following example. Suppose that I suddenly remember, having already gone to bed, that I have not brushed my teeth. It is clear to me that missing one night's brushing won't make much difference to my dental health and that getting up may result in my having a disturbed and fitful night's sleep, so I conclude that, all things considered, it would be better for me to stay in bed. Nevertheless, I reluctantly get up and plod to the bathroom. On Davidson's definition, my action counts as

incontinent - though it is more plausible to say here that pleasure has been worsted by duty rather than the other way round.

The problem of incontinence is represented by Davidson as an apparent inconsistency between three principles, all of which, according to Davidson, seem 'self-evident', or at any rate can be made so, given suitable interpretation. The three principles (from Davidson [1970] 1980: 23) are the following:

'P1: If an agent wants to do *x* more than they want to do *y* and they believe themselves free to do either *x* or *y*, then they will intentionally do *x* if they do either *x* or *y* intentionally.
P2: If an agent judges that it would be better to do *x* than to do *y*, then they want to do *x* more than they want to do *y*.
P3: There are incontinent actions.'

Davidson rejects what he calls 'the most common way of dealing with the problem of incontinence', that is, the abandonment of P2. Though he admits that 'wanting' and 'judging better' can readily be interpreted so as to render P2 false, he insists that there is also a natural reading that makes it true, which leaves the apparent inconsistency intact. 'Judging better', he suggests, cannot be totally divorced both from behaviour and from desire - if one sincerely believes that *x* is a better course of action, all things considered, than *y*, then one must, in some sense or other, want to do *x* more than one wants to do *y*. And provided one concedes this, the problem about weakness of will will remain.

Davidson's solution to the problem is an attempt to show that P1-P3 are not, after all, inconsistent. The argument turns on a distinction made by Davidson between unconditional evaluative judgments (for example, the straightforward judgment that it is better to do *x* than to do *y*) and conditional, or *prima facie*, evaluative judgments, which are relative to some body of evidence or other (such as the judgment that it is better to do *x* than to do *y*, given all the relevant factors known to the agent). Davidson offers a treatment of the latter variety of judgment from which it follows that no conditional evaluative judgment can be in any logical conflict with an unconditional one. This enables him to reconcile P1-P3 by saying that the incontinent agent who does *x* rather than *y* does indeed want to do *x* more than *y* and makes an unconditional judgment that the incontinent course of action, *x*, is better than *y*. The awareness that *y* is better than *x*, on the other hand, is relative to a body of reasons - the total body of reasons available to the agent - and therefore does not contradict the unconditional judgment in accordance with which the agent acts (see Intention §3).

4 Moral weakness

Moral weakness is that particular form of *akrasia* which consists in failing to live up to one's sincerely expressed beliefs about what it would be morally best to do. Nothing is more obvious, one might think, than that people often do things they genuinely consider to be morally wrong; but the existence of this type of weakness has sometimes been thought to present problems for certain moral theories. In particular, any theory which makes action the test or criterion of the sincerity of moral beliefs may have difficulty accounting for moral weakness. For such theories will tend to suggest that those who do not act on the principles they profess cannot really be said to hold those principles at all - thus their failing will turn out to be not *akrasia*, but hypocrisy.

R.M. Hare's ethical prescriptivism is one theory in particular which has been thought to conflict with the existence of moral weakness (see Prescriptivism). Hare's view (1963) is that it is part of the meaning of moral judgments that they *prescribe*; that is, they are intended as guides to conduct. The acceptance of some particular moral judgment, then, is the acceptance of a recommendation to act in some particular way in some given circumstance or type of circumstance - but how could one be said sincerely to have accepted such a recommendation if one fails to act in accordance with it? Hare's response, roughly, is to insist that typically, cases of 'moral weakness' are cases where the agents concerned are psychologically incapable of doing what they think they ought. Hare's view is that 'I ought but I can't' is not a contradiction; the agent here is 'prescribing in general terms, but exempting himself because of the impossibility, in his case, of obeying this general prescription' (1963: 53). One might wonder though, whether this is really a satisfactory account of *all* cases of moral weakness. Sometimes, no doubt, moral agents are prevented from acting as they think they ought by compulsions and irresistible forces, but it seems wrong to think of this as the general, or even the typical case.

al-Afghani, Jamal al-Din (1838-97)

Al-Afghani is often described as one of the most prominent Islamic political leaders and philosophers of the nineteenth century. He was concerned with the subjection of the Muslim world by Western colonial powers, and he made the liberation, independence and unity of the Islamic world one of the major aims of his life. He provided a theoretical explanation for the relative decline of the Islamic world, and a philosophical theory of history which sought to establish a form of modernism appropriate to Islam.

1 Life and times

Jamal al-Din al-Afghani was born in 1838 about 180 miles from Kabul, of a distinguished family. He received a thorough training in a variety of languages of Islamic countries and the religious sciences. When he was eighteen years old he began the constant travels which were to mark his life. He visited much of the Islamic world as well as Europe, and set up a political organization which called on Muslims to fight injustice and the imposition of imperialism. He had a great impact upon Muhammad ʻAbduh and reactions by intellectual Egyptians to the incursion of the Europeans. He eventually sided with the Ottoman empire but soon became disillusioned with the Sultan, and died in suspicious circumstances in Turkey in 1897.

2 Philosophy of history

Al-Afghani's philosophical contributions are to be found in his book *ar-Radd ʻalal-dahriyyin (Refutation of the Materialists)*. Citing philosophers such as Democritus and Darwin, he criticized the naturalist and materialist philosophers for their denial, either directly or indirectly, of the existence of God. He then went on to elaborate at great length on religion's contribution to civilization and progress. According to al-Afghani, religion has taught humanity three fundamental beliefs: its angelical or spiritual nature, the belief of every religious community in its superiority over other groups, and the assertion that our existence in this world is but a prelude to a higher life in a world entirely free from sorrow and suffering. Our angelic nature urges us to rise above our bestial proclivities and live in peace with our fellow human beings. The feeling of competitive superiority on the part of the various religious groups generates competitiveness, whereby the various communities will strive to improve their lot and persist in their quest for knowledge and progress. Finally, the third truth provides an incentive to be constantly aware of the higher and eternal world that awaits us. This in turn will motivate human beings to refrain from the evil and malice to which they may be tempted, and live a life of love, peace and justice.

Al-Afghani mentions that religion implants in its believers the three traits of honesty, modesty and truthfulness. He further maintains that the greatness of the major nations of the world has always been entailed by their cultivation of these traits. Through these virtues the Greeks were able to confront and destroy the Persian empire. However, when the Greeks adopted the materialism and hedonism of Epicurus, the result was decay and subjection by the Romans. Likewise the ancient Persians, a very noble people, began with the rise of Mazdaism the same downward journey as the Greeks, which resulted in their moral erosion and subjection by the Arabs. Similarly, the Muslim empire, which rose on the same solid moral and religious foundation as did both the Greeks and Persians, became so weakened that a small band of Franks (that is, the crusaders), was able to score significant victories against them. Subsequently, the hordes of Genghis Khan were able to trample the whole land of Islam, sack its cities and massacre its people.

Al-Afghani bases his philosophy on a theory of history in which religion is portrayed as a catalytic force in the progress of humanity. Interestingly, he stresses that religious beliefs must be founded upon sound demonstration and valid proof without any supernatural aspect. This rationalism manifests an important element of modernity in al-Afghani's thinking. However, such modernity does not diminish his strong belief in religion as an integral component and fundamental force behind humanity's quest for morality, truthfulness and integrity.

Al-Afghani's philosophical views revealed a great deal of faith in the human mind and its capacity for innovations based on knowledge rather than ignorance. He expressed great faith in humanity as being one of the greatest miracles of the universe, and believed that there are no areas which can remain forever closed to the human mind. Surprisingly, he predicted that people would reach the moon as a step in a series of strides by mankind, as he believed that nature and the universe were created so that we could continue the challenge of unravelling their

secrets.

In his criticism of Darwin's theory of evolution (see Evolution, theory of), al-Afghani presents a philosophical theory about nature in response to Darwin's theory. He believes in the nature of what he termed 'natural selection', whereby survival in nature will be for the strongest and the fittest. Thus if a number of plants are planted in a single space of earth which does not have food for all these plants, it will be noticed that the plants will compete among themselves for food. In due course, some of the plants will become more developed than the others, which will wither. He applies the same theory to the world of animals, including human beings, where the influence of power is more noticeable than elsewhere. He even goes further than Darwin by applying the theory to the area of ideas, maintaining that ideas are born out of other ideas and may be greater than those ideas; this explains why posterity may sometimes excel and be superior to its ancestry. Al-Afghani believes that these developments are due to the impact of nature's aspects and not necessarily the result of human effort. His criticism of Darwin's theory lessened gradually as he began to express views similar to those of Darwin. He cites earlier Muslim scholars such as Ibn Bashroun who had talked about the evolution from dust of plants and animals. Al-Afghani, however, continued to maintain strong disagreement with Darwin on one fundamental issue, that of the creation of life; this al-Afghani unequivocally ascribes to God.

al-‘Amiri, Abu’l Hasan Muhammad ibn Yusuf (d. 992)

Although al-‘Amiri had only a limited long-term impact, his extant works provide useful insights into an extremely creative period in Islamic philosophy in the tenth century AD. He attempted to reconcile philosophy with religion by showing that the genuine conclusions of philosophy could not contradict the revealed truths of Islam, and attempted to build consensus within Islam. He argued for the individual immortality and the punishment or reward of the soul. His analysis of the soul is largely Neoplatonic. The reward of the afterlife is determined by the actualization of the intellect in this life, aided primarily by right actions which moderate the physical faculties and turn the intellect toward the Divine.

Abu’l Hasan Muhammad ibn Yusuf al-‘Amiri was born in Khurasan (in modern Iran) in the early fourth century AH (tenth century AD) and died in Nishapur in AH 381/AD 992. He began his career in Khurasan, where he studied under Abu Zayd al-Balkhi, and moved to Rayy and Baghdad, where he met and was discussed by such substantial intellectuals as al-Tawhidi and Ibn Miskawayh. He ended his career in Bukhara, where he had access to the Samani library (in which Ibn Sina studied shortly thereafter), and in Nishapur.

Al-‘Amiri’s main concern was the rational defence of Islam against a form of philosophy regarded as independent of revelation, and against competing religious traditions. In the tradition of al-Kindi, he attempted to reconcile philosophy with religion by showing that the real conclusions of philosophy could not contradict the revealed truths of Islam. Unlike his contemporary al-Farabi, however, al-‘Amiri argued that revealed truth must be superior to philosophy, since revelation was necessary for the completion of the human intellect and as the indubitable guide to right action. The Greeks possessed useful wisdom, but they could not be considered final authorities because they lacked a prophet.

In spite of his attacks on, for example, the Mu‘tazila and the Batiniya esotericists, al-‘Amiri’s approach was generally conciliatory toward philosophy, the *mutakallimun* (theologians) and a wide variety of Islamic sects. His respected treatise on Sufism, for example, provided both a rational, Aristotelian interpretation of Sufism and a reconciliation of Sufism with more conventional Islam. He preferred to emphasize areas of agreement between philosophers and Islamic sects, perhaps because he perceived the dangers of sectarianism in the diverse environment of Khurasan and perhaps also because Islam had not fully consolidated its position relative to pre-Islamic traditions. He had a marked preference for religious, rather than philosophical, terminology (for example, *ruh* rather than *nafs* for the soul), indicating that his probable primary audience was the Islamic religious elite.

In *al-I‘lam bi manaqib al-Islam (An Exposition on the Merits of Islam)* and *Inqadh al-bashar min al jahr wa’l-qadar (Deliverance of Mankind from the Problem of Predestination and Free Will)*, al-‘Amiri attempted a rational justification of the moral superiority of Islam to other religions, especially to Zoroastrianism and Manicheism. In the latter work, he also attempted a resolution of the theological problem of free will by the application of Aristotelian principles, a project which he repeated with greater philosophical subtlety in his *al-Taqrir li-awjuh al-taqdir (The Determination of the Various Aspects of Predestination)*.

His resolution of the problem of predestination required a distinction between necessary, contingent and possible beings. Only God is necessary existence (*wajib al-wujud*), whose essence is identical with his existence. Human use of multiple terms for divine attributes is thus figurative, since God is essentially a unity. All other existents are contingent and, in so far as they require the support of necessary existence, are preordained. The relations of contingent things to each other, however, are of a different order, in which individual responsibility is possible. Significantly, al-‘Amiri’s use of the term *wajib al-wujud* is one of only two extant examples (the other is Ibn Miskawayh) of the use of this term prior to Ibn Sina, who adopted the term into the very heart of his thought. Al-‘Amiri’s interpretation of Empedocles suggests the possible existence of a pseudo-Empedoclean text or tradition extant in his time which might have been a significant precursor of some important Avicennan arguments.

Al-‘Amiri’s list of the five ‘sages’ of Greek philosophy is unusual, since Empedocles is first in a line which progresses through Pythagoras, Socrates, Plato and Aristotle. In keeping with al-‘Amiri’s conciliatory method, each was given a means of contact with a prophetic tradition, even though each spoke from the perspective of

reason alone. Empedocles was said to have studied with Luqman in Syria, and Pythagoras with the companions of Solomon in Egypt. Socrates, Plato and Aristotle then preserved and developed the wisdom of Pythagoras. Al-‘Amiri’s sources for philosophical history are primarily Neoplatonic, especially pseudo-Ammonius (see Neoplatonism).

One or more fragmented translations of the *Phaedo* were especially important for al-‘Amiri’s*Kitab al-amad ‘ala’l-abad (On the Afterlife)*, in which he argued for the individual immortality and punishment or reward of the soul. His analysis of the soul is largely Neoplatonic, and the reward of the afterlife is determined by the actualization of the intellect in this life, aided primarily by right actions which moderate the physical faculties and turn the intellect toward the Divine.

Al-‘Amiri’s work was soon eclipsed by the philosophical revolution brought about by Ibn Sina. Nevertheless, his work provides a window into the philosophical and religious debates which formed the background of that revolution and into the sources upon which the participants in those debates drew. Although partisans of various schools may find his interpretations problematic, his emphasis on the importance of good action over particulars of doctrine and his synthesizing interpretations represent an important attempt to build consensus within Islam during a turbulent, fractious, creative period in its history.

al-Baghdadi, Abu ’l-Barakat (*fl. c.*1200-50)

A maverick philosopher, respected medical authority, and seemingly somewhat tempestuous individual, Abu ‘l-Barakat al-Baghdadi produced one voluminous work (the Kitab al-mu‘tabar) in which the philosophical views current in his day - principally associated with the name of Ibn Sina - were subjected to a penetrating analysis, and many interesting alternatives suggested. His most provocative ideas concern self-awareness, the physics of motion and the idea of time.

Hibat Allah ‘Ali ibn Malka Abu ’l-Barakat al-Baghdadi was an idiosyncratic, highly original philosopher who flourished in the first half of the twelfth century. Precise biographical information is unavailable. We know that he was born into a Jewish family (his Hebrew name was Nathanel) and, as a Jew, was refused entry to the lectures of Abu ’l-Hasan ibn Hibat Allah, a famous physician. Other slights, real or imagined, that he suffered on account of his faith seem to have contributed to his decision, very late in life, to convert to Islam. The appellation *awhad al-zaman*, ‘the singular [personage] of his time’, probably reflects his medical rather than philosophical achievements. His formal teaching seems to have been limited to medicine, in which he had a number of students. Ibn Khalliqan’s biographical dictionary describes him as ‘very presumptuous’, his hauteur being revealed in his many disputes with the humbler physician Ibn al-Talmidh, which display the ‘jealousy and rivalry that typically prevail between men who are eminent in the same profession’. His involvement in philosophy seems to have been informal (even by the standards of the time) and tentative. He had one notable disciple in the polymath Fakhr al-Din Al-Razi.

Al-Baghdadi’s mature views are found in his comprehensive *Kitab al-mu‘tabar*, the title of which should be translated, according to Shlomo Pines (1979), ‘the book of what has been established by personal reflection’. Al-Baghdadi characteristically begins his investigations with a pellucid statement of each problem he considers. He then surveys earlier opinions in detail, rarely naming his sources. He takes great pains to ferret out the reasoning underlying each claim, following closely the development of the theory, the objections raised against it and the adjustments made by its proponents. Each issue is approached freely and independently, without much reliance on any over-arching methodological or philosophical commitments. The interplay between words and concepts is given particular attention. For example, al-Baghdadi developed his strikingly innovative theory of time after reaching the conclusion that the word ‘time’ as used in everyday speech stands for a very fundamental concept, the true nature of which has been obscured by scholastic analysis. Again, he lambasts aspects of the sulphur-mercury theory of metals as ‘words that denote unreal fancies’.

Perhaps most interesting among al-Baghdadi’s achievements is his reappraisal of the idea of time (Pines 1979). Dissatisfied with the regnant approach, which treated time as an accident of the cosmos, al-Baghdadi drew the conclusion that time is an entity whose conception (*ma‘qul al-zaman*) is *a priori* and almost as general as that of being, encompassing the sensible and the non-sensible, that which moves and that which is at rest. Our idea of time results not from abstraction, stripping accidents from perceived objects, but from a mental representation based on an innate idea. Al-Baghdadi stops short of offering a precise definition of time, stating only that ‘were it to be said that time is the measure of being (*miqdar al-wujud*), that would be better than saying [as Aristotle does] that it is the measure of motion’. His reclassification of time as a subject for metaphysics rather than for physics represents a major conceptual shift, not a mere formalistic correction. It also breaks the traditional linkage between time and space. Concerning space, al-Baghdadi held unconventional views as well, but he did not remove its investigation from the domain of physics (see Space; Time).

Al-Baghdadi’s most significant departure in psychology concerns human self-awareness. Ibn Sina had raised the issue of our consciousness of our own psychic activities, but he had not fully pursued the implications for Aristotelian psychology of his approach. Al-Baghdadi took the matter much further, dispensing with the traditional psycholgical faculties and pressing his investigations in the direction of what we would call the unconscious.

Al-Baghdadi had many new ideas concerning the physics of motion. He seems to have adumbrated the notion of acceleration as an increase in the velocity of a moving body attributable to the application to it of a constant force. He also seems to suggest that motion is relative, that is, that there is motion only if the relative positions of the bodies in question change. These ideas are highlighted here because of their resemblance to modern thoughts on

the same subjects. The *Kitab al-mu‘tabar* contains many other, no less innovative ideas that have no modern counterpart; for example, the claim that each type of body has a characteristic velocity that reaches its maximum when its motion encounters no resistance. Although *al-Mu‘tabar* is not a systematic work, comprising instead notes on various subjects that al-Baghdadi wrote for himself over the years, Pines showed that the paramountcy of *a priori* knowledge underlies many of the work’s criticisms and innovations.

The impact of *al-Mu‘tabar* on Islamic thought seems to have been limited to the Ishraqi (illuminationist) tradition, broadly defined (see Illuminationist philosophy). Indeed, the work’s tripartite structure (logic, physics, metaphysics), the pride of place given to *a priori* knowledge, and the consequent primacy given to the author’s own speculations, are the distinguishing features of Ibn Sina’s *Isharat wa-’l-tanbihat*, the earliest prototype of the genre, and of al-Suhrawardi’s *al-Talwihat*, its most important representative. However, the spiritual tone of the latter two books is far less prominent in al-Baghdadi’s work, although perhaps not entirely absent. As Pines showed, the Ibn Sina of *al-Shifa’ (Healing)* is the target of many of al-Baghdadi’s criticisms, strictures often pursued in Fakhr al-Din al-Razi’s commentary on *al-Isharat*, and answered in Nasir al-Din al-Tusi’s glosses to the same work. Al-Tusi usually refers to ‘al-Baghdadi and the other later [philosophers],’ giving the impression that al-Baghdadi was the outstanding representative, or even founder, of a whole school of thinkers who challenged some of Ibn Sina’s views. Al-Suhrawardi’s *al-Talwihat* refers to al-Baghdadi obliquely as ‘one of the Jewish philosophers’. The target of that reference is made clear by Ibn Kammūna, whose commentary on *al-Talwihat* cites al-Baghdadi several times. Al-Baghdadi’s views were known to al-Shahrazuri, and he is mentioned some half-dozen times in Sadr al-Din al-Shirazi’s *al-Asfar al-arba‘a*.

Despite his conversion to Islam, al-Baghdadi’s works continued to be studied at the *yeshivah* of Baghdad, then the centre of Jewish conservatism, into the thirteenth century. Al-Baghdadi’s commentary to the Book of Ecclesiastes continued to be copied at the same *yeshivah*, with full acknowledgement of its authorship. Shmu’el ben Eli, head of the *yeshivah* and archrival of Moses Maimonides, cites the *Mu‘tabar* in support of his contention that even ‘the philosophers’ are forced to admit the possibility of bodily resurrection. Ben Eli does not reveal his source; it appears to have been Maimonides’ disciple, Yosef ben Yehudah, who tracked down the reference.

Ibn Khalliqan reports that al-Baghdadi had a high reputation in the field of medicine, and al-Suhrawardi refers to him as ‘a physician who sought to do philosophy’. He attended some of the Seljuq sultans and their families and is reported to have cured himself of leprosy, in the process causing himself a period of blindness. Ibn Abi Usaybi‘a’s biographical compendium relates some anecdotes and sayings and lists several of al-Baghdadi’s medical works. However, few if any of these survive, and none have been studied. Al-Baghdadi also wrote a short treatise ‘On the Reason that the Stars appear at Night but are invisible during the Day’, and another small tract on the intellect.

Albert of Saxony (*c.*1316-90)

Albert of Saxony, active in the middle and late fourteenth century, taught at the University of Paris and was later instrumental in founding the University of Vienna. He is best known for his works on logic and natural philosophy. In the latter field he was influenced by John Buridan, but he was also influenced by the English logicians. His thought is rather typical of the sort that followed Buridan, combining critical analysis of language with epistemological realism. He was important in the diffusion of terminist logic in central Europe, and of the new physics in northern Italy.

Albert of Saxony, or Albert of Rickmersdorf (sometimes called Albertus Parvus (Little Albert) to distinguish him from Albert the Great) was born in Helmstedt, Germany, around 1316. He studied first in his native region before going on to Erfurt (although this is not known for certain) and then to Paris, where he became Master of Arts in 1351. In 1353, he became rector of the university, and taught in the arts faculty there for a decade; he also studied theology, though apparently without receiving a degree. After a period during which he was involved in diplomatic mediation between the pope and the Duke of Austria, Albert was put in charge of founding the University of Vienna, and in 1365 he became its first rector. In 1366 he was made a canon of Hildesheim and was named bishop of Halberstadt. He remained in the latter position until his death on 8 July 1390.

Since none of his theological writings survives, Albert of Saxony is known especially for his work in logic and natural philosophy. However, he also wrote commentaries on Aristotle's *Ethics* and *Economics*, as well as a few small works on mathematics (*Tractatus proportionum (Treatise on Proportions)*, *Quaestio de quadratura circuli (Question on the Quadrature of the Circle)*). In the field of logic, his main work is the summa entitled *Perutilis logica (Very Useful Logic)*. He also wrote a voluminous collection of *Sophismata* (examining various difficulties of interpretation due to the presence of syncategorematic words in sentences), a set of *Quaestiones logicales (Logical Questions)* that deal with semantical problems and the status of logic, and commentaries on Aristotle's Organon.

Although Buridan was then very popular in the arts faculty at Paris, Albert's work attests also to the influence of English ideas in Paris. The *Perutilis logica*, while developing treatises on obligations, insolubles and consequences, which were becoming more and more important at the time, is organized on the model of William of Ockham's *Summa logicae* (see William of Ockham §6). Albert accepts Ockham's conception of the nature of a sign. He believes that signification rests on a referential relation of the sign to the individual thing, and that the spoken sign depends for its signification on the conceptual sign. He follows Ockham again in his conception of universals and, for the most part, in his theory of supposition. In particular, he preserves Ockham's notion of simple supposition, the direct reference of a term to the concept on which it depends when it signifies an extra-mental thing. Finally, Albert follows Ockham in his theory of categories: contrary to Buridan, he refuses to treat quantity as a feature of reality in its own right, but rather reduces it to a disposition of substance and quality.

On a few points, however, Albert distances himself from Ockham. For instance, he denies that in disputation an equivocal proposition must be the object of a distinction through which it is assigned multiple senses: in disputation, even equivocal propositions can only be granted, denied or doubted. In his *Sophismata*, Albert often follows William Heytesbury (for example, in the analysis of epistemic verbs or of infinity). He admits that a proposition has its own signification, which is not that of its terms: just like a syncategorematic word, a proposition signifies a 'mode of being'. Albert avoids concretizing such modes of being and, in the final analysis, traces them back to relations among the things to which the terms refer. Nevertheless, he makes use of the idea of the distinguishable signification of the proposition in defining truth and in dealing with 'insolubles' (paradoxes of self-reference). Since every proposition, by its very form, signifies that it is true, an insoluble proposition will turn out to be false because it will signify at once both that it is true and that it is false (see Language, medieval theories of).

Albert's analysis of language is combined with an epistemological realism that emerges, for instance, from his analysis of the vacuum. One could imagine that, through divine omnipotence, a vacuum exists. However, no science of nature can countenance the hypothesis of the existence of a vacuum. Albert refuses to extend the reference of the terms of physics to supernatural possibilities; thus in his view, physics cannot be developed

through thought experiments or the study of imaginary cases, contrary to what was being done at Oxford at the time. Instead, physics must report on the natural course of things.

Aside from his commentaries on Aristotle's *libri naturales*, Albert wrote a commentary on John of Sacrobosco's *De sphera (Treatise on the Sphere)*, and a *Tractatus proportionum (Treatise on Proportions)* inspired by Thomas Bradwardine. Following the works of the Oxford Calculators (see Oxford Calculators), and of Nicole Oresme in Paris, he tried to calculate the acceleration of the fall of bodies, but without succeeding in determining whether it is proportionate to the time elapsed or to the distance covered. He was interested in many natural phenomena and studied the movements of the earth and the phenomena of tides and geology.

It is probably in the field of dynamics, however, that Albert's role is most important. In order to account for the motion of projectiles and for the acceleration in the fall of weights, he adopted Buridan's impetus theory, according to which impetus is a property acquired by bodies. With great clarity, he draws the consequences of extending this theory to celestial movements, and is thus able to reject the traditional notion of intelligences moving the spheres. He studies the motions of terrestrial and celestial bodies according to the same principles. Many of his contributions to the field of dynamics are in his commentary on Aristotle's *On the Heavens*, which was very influential in northern Italy. Albert of Saxony thus took part in the development of a vision of the cosmos which broke with Aristotelian views.

Albert the Great (1200-80)

Albert the Great was the first scholastic interpreter of Aristotle's work in its entirety, as well as being a theologian and preacher. He left an encyclopedic body of work covering all areas of medieval knowledge, both in philosophy (logic, ethics, metaphysics, sciences of nature, meteorology, mineralogy, psychology, anthropology, physiology, biology, natural sciences and zoology) and in theology (biblical commentaries, systematic theology, liturgy and sermons). His philosophical work is based on both Arabic sources (including Alfarabi, Avicenna and Averroes) and Greek and Byzantine sources (such as Eustratius of Nicaea and Michael of Ephesus). Its aim is to insure that the Latin world was properly introduced to philosophy by providing a systematic exposition of Aristotelian positions.

Albert's method of exposition (paraphrase in the style of Avicenna rather than literal commentary in the style of Averroes), the relative heterogeneity of his sources and his own avowed general intention 'to list the opinions of the philosophers without asserting anything about the truth' of the opinions listed, all contribute to making his work seem eclectic or even theoretically inconsistent. This was compounded by the nature and number of spurious writings which, beginning in the fourteenth century, were traditionally attributed to him in the fields of alchemy, obstetrics, magic and necromancy, such as The Great and the Little Albert, The Secrets of Women and The Secrets of the Egyptians. This impression fades, however, when one examines the authentic works in the light of the history of medieval Aristotelianism and of the reception of the philosophical sources of late antiquity in the context of the thirteenth-century university.

1 Introduction of philosophy to the Latins

After studying in Padua and Cologne, Albert entered the Dominican order around 1220. He was the first German to become master of theology at the University of Paris (1245-8). He then taught at the Dominican *studium* at Cologne (where his students included Thomas Aquinas (until 1252) and Ulrich of Strasbourg). Between 1254 and 1257 he was the Dominican Provincial of Teutonia (Germany). As bishop of Ratisbon (Regensburg) in 1260, at the express request of Pope Urban IV, he preached the crusade 'in Germany, Bohemia and other Germanic countries'. After various visits to Würzburg (1264) and Strasbourg (1267), he lived in Cologne until his death in 1280.

Albert's teaching in Paris was dominated by his writing the *Summa de creaturis (Book of the Creatures)* before 1246. Despite the censure imposed on the study of Aristotle during the preceding decade, Albert made extensive use of Greek-Arabic Aristotelianism in his theology (see Aristotelianism, medieval). The same tendency can be seen in his commentary on the *Sentences*, begun in Paris and finished in Cologne in 1249. It was also in Cologne, while at the *studium generale* of the Dominican Order, that Albert wrote most of his works in natural philosophy, including the *Physics*, the commentary on *On the Heavens*, the *Liber de natura locorum (The Nature of Places)* and the *De causis et proprietatibus elementorum (The Causes and Properties of the Elements)*. In 1250-2, he presented in lectures his first commentary on the *Nicomachean Ethics* (the *Super Ethica*, a question-commentary). He returned to the *Nicomachean Ethics* in 1262-3, this time producing a paraphrastic commentary, the *Ethica*.

Albert's large-scale paraphrases on the Organon were written between 1252 and 1256, based on Arabic works by Avicenna (see Ibn Sina) and Alfarabi (see al-Farabi) which are for the most part lost today, and also on Latin works (the *Logica modernorum* and commentaries by Robert Kilwardby, with which Albert became familiar in Paris). The works on botany (*De vegetabilibus et plantis libri VII*) and on mineralogy (*De mineralibus*) were written in 1256-7; the treatises on biology and zoology (*Quaestiones super De animalibus*) are drawn from disputed questions held in 1258. In 1262-3, Albert wrote his commentary on Euclid (*Super Euclidem*). The last years of his life were devoted to metaphysics and theology; his paraphrase of the *Metaphysics* was written in 1263-7. At the same time he wrote the *De causis et processu universitatis (The Causes and Development of the Universe)*, a general exposition of an Aristotelian natural theology in which Albert brings together all the intellectual themes of late antiquity that were available in the second half of the thirteenth century.

At this time, the mendicant orders vigorously denounced the intrusion of philosophy into theology. For instance, Bonaventure in the *Collationes de Decem praeceptis (Discourses on the Ten Commandments)* in 1267 attacked the 'arrogant presumption of philosophical investigation' that 'corrupts all of Holy Scripture' and denounced not only those who 'create' the philosophical 'fictions' but also those who 'sustain and reproduce them'. In that context,

Albert's project to 'bring Aristotle to the Latins' constitutes a genuine defence of philosophical endeavour, not only in the medieval university but also in Christian society in general. In Albert's view, the enemies of philosophy who 'killed Socrates, threw Plato out of Athens… and forced Aristotle into exile' (he openly criticizes them in his paraphrase of the *Politics* VIII, 6) are comparable to the 'brute beasts' of his time who 'blaspheme against what they don't know', university 'preachers' who in their sermons 'attack the use of philosophy with all possible means', 'without anyone's being able to answer them' (commentary on the VIIth Letter of Dionysius).

In opposition to these critics, Albert asserts the need to know and assimilate the philosophy of the ancients. His insistence on the need for philosophy might seem ambiguous in so far as it gives rise to a distinction between two disciplines 'distinct in their principles': theology, which is 'founded on revelation and prophecy', and philosophy, which is 'founded on reason' (*Metaphysica* XI, 3, 7). This distinction, however, corresponds to a deeply rooted tendency in the thirteenth century. The condemnations of 1277 at Paris are evidence of its strength and efficacy. *Nihil ad me de Dei miraculis, cum ego de naturalibus disseram* (God's miracles mean nothing to me, since I am discussing natural things and events), the rallying cry of the 'Latin Averroists' popularized by Siger of Brabant (*De anima intellectiva (The Intellective Soul)* III), was originally Albert's (*De generatione et corruptione* I, 1, 22). He borrowed it consciously and simultaneously from two authorities, one philosophical (Averroes (see Ibn Rushd)) and the other theological (Bernard of Clairvaux, reformulating a passage from Augustine). Albert wrote all his philosophical paraphrases in order to develop fully the discipline of philosophical research, a discipline that is autonomous in its own domain, the domain of rational argumentation.

The nature of Albert's commentaries might also seem ambiguous, in so far as his avowed Aristotelianism covers a complex mix of Aristotelian and Neoplatonic theses. This ambiguity, however, cannot be blamed on Albert as it is present in his own Arabic 'Aristotelian' sources, which were for the most part permeated with the syncretic view of Aristotle inherited from the Neoplatonic commentators of the fifth and sixth centuries (see Aristotelianism in Islamic philosophy; Neoplatonism in Islamic philosophy). In asserting that 'philosophical perfection' can only be attained with both Aristotle and Plato as its foundation (*Metaphysica* I, 5, 15), Albert, who knows little of Plato, is really taking up the 'harmonizing' reading of the Neoplatonic philosophers of late antiquity (see Neoplatonism), which was adopted by the Arabic Aristotelians. If his vision of Aristotle seems more Neoplatonic than Aristotelian, it is precisely because it is based as much on the philosophies of Arabic commentators on Aristotle (Alfarabi, Avicenna, the *Liber de causis* and Averroes) as it is on the philosophy of Aristotle himself.

As the principal engineer of the introduction of philosophy to the Latins, Albert tried to portray as homogeneous a philosophy that is not and cannot be homogeneous in the eyes of the philologist. It is, however, this Arabic-Latin version of Aristotelianism which was successfully installed in the Schools and was opposed to other versions of Aristotle in the fifteenth century, Thomistic Aristotelianism and the Aristotelianism of the school of John Buridan, which present Aristotle in a form more recognizable to us (see Aristotelianism, medieval).

2 Logic

Although he paraphrased all of the Organon, in expositions that were used frequently until the end of the fifteenth century, it is not on account of its contribution to the development of the *logica modernorum* that Albert's logical work is most noteworthy. His principal contribution is in connection with the problem of universals (see Universals). Porphyry, in the *Isagōgē*, had wanted to keep this problem separate from the thought of the logician, and to make it the domain of metaphysics and theology. It was Albert who first systematically formulated the theory of universals that prevailed in scholastic and neoscholastic thought, the doctrine that there are three types of universals (*ante rem*, *in re* and *post rem*). This doctrine is characteristic of the harmonizing tendency that dominates all of Albert's thought. It is also evidence of the continuity which, thanks to this doctrine, was established between the philosophy of late antiquity and the philosophy of the late Middle Ages.

In answer to Porphyry's problem (whether genera or species exist in themselves or reside in mere concepts alone; whether, if they exist, they are corporeal or incorporeal; and whether they exist apart from or in and dependent on sense objects), Albert does not repeat the arguments and theses of the realists and nominalists of the twelfth century (though he knows them), and he does not choose between realism, conceptualism and nominalism. Instead, he takes up and develops a distinction between types of universals which allows him to give a three-part answer to the problem posed by Porphyry, an answer that is neither realist nor nominalist in the sense of the twelfth century but is meant to transcend the conflict itself. Universals, then, are neither universal extramental 'things' (as the

realists believed), nor simple words or concepts (as the nominalists believed). Rather, a universal is one entity with three different aspects, three *modi essendi* (modes of being), which differ depending on whether the universal is considered in itself (in divine thought or the separated Intellects), in natural things or in human thought. Albert draws this three-part distinction from Avicenna's *Logica*, reinforced by certain remarks from Eustratius of Nicaea's *Commentary on the Nicomachean Ethics*. This view of universals makes the Platonic notion of separated Forms compatible with the Aristotelian notions of immanent forms and abstract concepts, and makes it possible to preserve both notions within the same theory.

In reviving this doctrine, Albert unwittingly takes up the Neoplatonic solution to the problem of universals, the distinction between universals that are before particulars (*pro tōn pollōn*), after particulars (*epi tois pollois*) and in particulars (*en tois pollois*), a distinction that was systematized most notably by Ammonius, David and Elias (see Neoplatonism). Albert's extensive use of Arabic and Byzantine sources to illuminate Latin knowledge of the twelfth century had at least two clear consequences: the subordination of logic to metaphysics and, in metaphysics itself, the subordination of Aristotle's 'Aristotelianism' to a Greek-Arabic version of Aristotelianism (which became the foundation of early neoscholasticism). Indeed, it is on this structure that Albert's disciples (the 'neo-Albertians') built their school's most characteristic positions as early as the fifteenth century. Jean de Maisonneuve, Albert's principal disciple in Paris in the early 1400s, criticized the nominalist followers of Buridan (the *epicuri litterales*) for reducing the universal to the simple abstract concept, a criticism which Heimeric of Campo levelled against Thomists as well. On the other hand, Heimeric also criticized the *formalizantes* (such as Jerome of Prague) for believing in the existence of separated universals such as Plato's Ideas. In short, Albert's disciples criticized other views of universals for being unilateral philosophies that consider only one aspect of the being of universals.

3 Psychology

In the field of psychology, Albert worked primarily on the exposition of the fundamental concepts of Aristotle's theory of the soul, especially of the theory of the intellect. Albert tried to correct and contribute to the exposition of Aristotle in two areas. He fought against the doctrine of the unity of the intellect (or 'monopsychism' as Leibniz called it), which tradition attributed to Averroes but which Albert attributed to 'all of the Arabs'; and he followed Averroes in criticizing the materialism of Alexander of Aphrodisias. In addition to his critical work, Albert also tried to integrate the essence of the Greek-Arabic theory of the intellect, beginning with Averroes' version, from which he 'dissents little' ('*in paucis dissentimus*', *De anima* III, 3, 11). Indeed, it is clear that the monopsychism Albert criticizes is the same as that which Averroes already criticized in his 'Great' commentary on *On the Soul*: Avempace's thesis that there is only one intellect for all men, which is joined to the human soul 'by means of images' (*phantasmata*) (see Ibn Bajja; Ibn Rushd). This view is unacceptable, says Averroes, because it reduces the material intellect to a simple 'faculty of imagination'.

Albert only occasionally extends his criticism of monopsychism to Averroes. There are two reasons for this reticence: first, Albert is too dependent on Averroes to criticize his theory of intellect without making his own theories incoherent; and second, he does not interpret Averroes in the light of the Averroists' extrapolations, as Aquinas does. Far from seeing Averroes as the 'debaser' and the 'corrupter of Aristotelianism', Albert on the contrary wants to show that Averroes is the only one to have successfully opposed Alexander's materialist theory on the grounds that it is a 'very grave error which entails the denial of all the nobility and even of the immortality of the human soul' (*De anima* III, 2, 5). Therefore, Albert holds the view that the possible intellect is external to man, not because he understands it as a monopsychist thesis, as Aquinas does, but because, like Averroes, he understands it in the more precise and limited sense that the possible intellect is not the perishable 'form' of a perishable body, nor a 'corporeal power caused by the elements' that constitute the body.

What Albert judges to be fundamental in Averroes, then, is the criticism of Alexander's theory of the 'eduction' of the intellect, not his thesis of the unity of the possible intellect. That is why Albert often asserts his perfect agreement with Averroes who, better than any other, was able to prove the thesis which 'from antiquity, all Aristotelians have held', excepting Alexander, that 'the intellect enters the soul from the outside, it does not arise from the composite or the mix of the elements, and does not pre-exist in potentiality in them'. To apply the *eductio formarum* (eduction of forms) to the intellect implies denying its 'divinity' and 'depriving man of his nature', and that poses a greater danger than giving an unsatisfactory explanation of the manner in which the possible intellect

is united to human beings.

The essence of Albert's criticism of Averroes thus centres on the difficult notion of the 'acquired intellect' (*intellectus adeptus*). Averroes reduces the acquired intellect to a momentary union of the human soul and the separated intellect (each time there is an act of intellection), when instead one should think of it as a real power and part of the soul, emanated in it, which is developed and strengthened by the acquiring of more intelligibles. In Aristotelian language, one should think of the acquired intellect as a stable disposition (*habitus*) and not as a transitory state (*qualitas passibilis*). Thus, Albert does not reject Averroes' view of the union of the soul with the separated intellect: he adapts and perfects it. It is also on the basis of this view that Albert reorganizes the entirety of the Aristotelian doctrine of the intellect; and that he establishes, as early as the *Summa de creaturis*, a correspondence table for the different classifications found in tradition. In this, Albert and Aquinas are fundamentally opposed. Albert takes Averroes as his guide to reinterpret Aristotelianism, while Aquinas tries to distinguish Averroes from the Arabic sources (Avicenna and al-Ghazali) and the 'Greek' sources (Alexander, Themistius and Theophrastus) in order to interpret Aristotle anew against him (see Averroism).

4 Metaphysics

In the field of metaphysics, Albert's work takes an original direction, again characterized by a certain syncretism. Drawing from Aristotle, Avicenna (see Ibn Sina), the *Liber de causis* (see Liber de causis) and Pseudo-Dionysius, he formulates a system which again places him very much at odds with Aquinas. Albert's philosophy is set in the context of Aristotelian cosmology, which he claims is valid from the point of view of natural reason. As a consequence, Albert admits in his philosophy the system of Intelligences, which he carefully distinguishes from angels. (He considers that identifying the two is a theological error, though not a specifically Christian one since he denounces it primarily in two Jewish thinkers, Moses of Egypt, also called Maimonides, and Isaac Israeli.) This distinction was taken up and made more rigid by Albert's German Dominican followers, including Dietrich of Freiberg and Berthold of Moosburg, together with the distinction between the order of 'natural providence' (the order to which Aristotle, the Arabic philosophers and Proclus refer) and the order of 'voluntary providence' (the order to which the Bible and theologians refer). This is a strictly philosophical way of contrasting the world of nature and that of miracles, the world of the natural and that of the supernatural, a contrast which theologians capture by the strictly theological division between the 'ordered' and the 'absolute' power of God.

However, in his formulation of an Aristotelian metaphysics, Albert adds two important corrections to the elements he adopts from the Arabic sources. First, while adopting Avicenna's metaphysics of emanation, he radically modifies the theory of formal emanation (*fluxus* or *influentia*). The *fluxus formae* from which the intelligible and material universe arises does not consist in an 'overflowing' (*infusio*, *effusio*) of the forms from an emanating Principle (Avicenna's and al-Ghazali's *dator formarum*). Rather, it consists in an anagogical process, the final causality of the 'appeal of the good' (*advocatio boni*), a view Albert draws from Pseudo-Dionysius, John Scottus Eriugena and Maximus the Confessor, all of whom he would have read in the Dionysian corpus of the University of Paris. As a partisan of the unity of substantial form, who holds at the same time that the forms of things are contained in matter in an inchoate state ('the inchoation of forms'), Albert views all form-generating processes as ruled by the celestial spheres and their movers by means of a causality of attraction rather than strict emanation. The first principle or 'First Cause' does not infuse forms into matter: form and matter are con-created. The function of the first principle is to call to itself all forms that are contained in matter, to unify them and to assemble them by means of the 'final attraction' that it exerts on everything that is.

This notion of 'attraction' by the Good presupposes an identification of the First Cause of Arabic Aristotelianism with the Platonic Good. Albert makes this identification consciously by showing that the Latins who reduce emanation to a simple metaphysical mechanism corrupt all of philosophy. The true theory of emanation is the one that makes the Good into a principle that is 'diffusive of itself and of being' (*diffusivum sui et esse*), not by overflowing but by attracting. Albert explains that the supreme Good, the First Cause, 'calls all things to be', that is, to 'resemble' it, because the nature of goodness is to call (*bonum* comes from *boo*, *boas*, that is, *voco*, *vocas*, to call), and its diffusion is nothing other than its calling (*diffusio* and *boatus* are synonyms). He supports this view, not without paradox, by appealing to Paul's letter to the Romans 4: 17: 'God calls those things that are not as well as those that are'.

Second, in order to certify that this assimilation of the First Cause with the final cause of being qua being is

authentically Aristotelian, Albert claims that Aristotle's metaphysics is not the last word of Aristotelianism. Metaphysics must be completed by theology. Albert claims that he finds this theology in the *Liber de causis*. Far from seeing in the *Liber de causis* an Arabic adaptation of Proclus' *Elements of Theology* (as his student Aquinas did), Albert asserts that it is a work compiled by the mysterious 'David the Jew' (possibly Ibn Daud?) on the basis of one of Aristotle's letters *On the Principle of the Universe* (really a work of Alexander of Aphrodisias, which has survived only in Arabic translation) and other elements borrowed from Aristotelian philosophers. Albert's belief in the Aristotelian authenticity of the *Liber* (widely accepted in Paris in the 1250s), allows him to spell out a complete Aristotelian system that comprises metaphysics (the theory of being as being) and theology (the theory of the cause of being) and goes further than the rudiments available in Book XII of Aristotle's *Metaphysics*. The supreme principle is not a mere first mover (*primum movens*), it is also a first producer (*primum agens*) that produces (emanates) all things and draws back (attracts) all things into one.

In his *De causis et processu universitatis*, the height of his speculative philosophy, Albert offers us the most important 'reconstruction' of Aristotelian theology we have received from the middle ages. This complete theology is composed of a theory of the First Cause which draws from all the Arabic sources, (in particular al-Ghazali), and a theory of emanation drawn from the *Liber de causis*. It is thus clear that, unlike his contemporaries, Albert does not merely contrast revealed theology and rational philosophy, but within philosophy itself he contrasts natural theology and simple metaphysics. Aristotle's metaphysics is therefore completed twice.

Book I of *De causis et processu universitatis*, titled *De proprietatibus primae causae et eorum quae a prima causa procedunt* (On the Properties of the First Cause and of the Beings That Emanate From It), reveals the character of Albert's general inquiry by characterizing the three philosophical positions of antiquity (Epicurean, Stoic and Aristotelian) on the basis of their relation to the fundamental problem of theology: *de primo omnium principio* (the first principle of all things) or *de universi esse principio* (the universal principle of all things). Then comes the analysis of the fundamental themes of Aristotelian theology: *De scientia primi* (the knowledge of the first principle), *De libertate, voluntate et omnipotentia primi* (the freedom, will and omnipotence of the first principle) and *De fluxu causatorum a causa prima et causatorum ordine* (the outpouring of causal things from the first cause and their ordered relationship), all of which are profoundly influenced by al-Ghazali's views. In fact, Treatise IV, which constitutes the transition between Books I and II, corresponds exactly to the programme of metaphysics that al-Ghazali formulates at the beginning of Book I, V, of his own *Metaphysica*: *Quomodo omnia habent esse a primo principio et quomodo omnia perveniunt ad unum qui est causa causarum* (How all things have their being from the first principle, and how all things return to the One that is the cause of causes).

Albert gives his paraphrase of the *Liber de Causis* in Book II, which he devotes to the analysis of the elements of the noetic cosmos (Intelligences and 'noble souls', movers of the heavens), the description of the outpouring of beings (*de fluxu entis*) and the theory of the government of the universe by the First Cause. On almost every point, he holds views opposed to those of Aquinas in the latter's commentary. The strength and appeal of Albert's reading of the completed 'Aristotelian' system is such that it resists Aquinas' philological discovery. Until his death, Albert continued to assert the Aristotelian authenticity of the *Liber de causis*, and the necessity of it for completing the *Metaphysics* with a theology.

The distance between the philosophical positions of Albert and Aquinas can be seen even more clearly in their more specific and detailed theories. In the field of ontology, for example, Albert holds Avicenna's theory of the 'indifference of the essence' (the essence itself is neither universal, in the way empirical abstract concepts are, nor particular, in the way particular beings existing outside the soul are), and he draws a connection between this theory and the theory of the three states of a universal. Thus he provides a picture of the process of abstraction that is entirely different from Aquinas' Aristotelian view. This distance between the two was later reinforced by the neo-Albertians: neither Jean de Maisonneuve nor Heimeric of Campo, for whom 'in its essence, the universal is one, though it can occur in the soul, in the thing and in itself' according to three modes of being, viewed the universal as it is in the soul using nominalist and/or Thomistic models of abstraction. The formation of the universal *in anima* is not the result of abstractive induction on the basis of particulars, but rather the result of a complex illumination of the human soul by the Intelligences, according to the process of mental unification and simplification described in the theory of attractive causality. The formation of the concept called abstract is the result of the fact that the 'human soul is the instrument of the light of the First Intelligence' and that the First Intelligence uses it in order to draw back everything into one.

Similarly, while Albert, like Aquinas, is a resolute supporter of the analogy of being, his view, described long before that of Aquinas, combines in an original way the ‘focal’ analogy of Averroes (*analogia attributionis or analogia accidentis*, the coordination of the different ways in which being is accepted by the category of substance), and Pseudo-Dionysius’ analogy ‘of reception’ (*analogia recipientium*, the defining of each being by its ‘measure’ or ‘receptive capacity’ which places it in a hierarchy). The problems which Albert’s and Aquinas’ theories of analogy set out to solve are entirely different. Albert’s understanding of analogy is primarily meant to correct the static version of emanationism that dominates the Latin interpretation of the ‘Aristotelian’ cosmology and noetic. He rejects the Latin analogy between the overflowing of the first cause and the way in which the light of the sun is incorporated into different bodies: God’s communication with beings, according to the *analogia recipientium*, is not the simple overflowing of the ‘giver of forms’ into the universe of beings subordinated to him. For the Latin disciples of Avicenna, the light (*lux*) of the First Cause, unique and identical in itself, applies indifferently and uniformly to all beings, shining (*superlucens*) the same light (*lumen*) on all. It gets differentiated within them, according to their receptive capacity, which is determined by their nature or essence. For Albert, the axiom according to which the ‘received’ (*receptum*) is found in the ‘receiver’ (*recipiens*) according to its analogy or receptive capacity, is not sufficient to characterize the analogical communication of the Principle (as long as this capacity is conceived as a mere passive reception, and not rather as an active assimilation performed for all beings by the intellectual beings only). The communication of the Principle is fully realized only in the intellectual conversion of the entirety of being. In turn, this conversion occurs through the mediation of those beings that are capable of intellective activity and who insure the anagogical assimilation of the universe to the principle from which it emanates. The diffusion of the Good or the First Principle is not a simple ‘exit’, it is a double movement of exit (*exitus*) and return (*reditus*), of descending and rising, to which all thinking beings contribute.

For Albert, the theory of analogy is thus not primarily meant to answer the problem of the ‘multiple meanings of being’. It is not an ontological or semantic theory meant to solve the aporias of the ‘problem of being’ formulated by Aristotle in Book IV of the *Metaphysics*. Rather, it is a theological doctrine which, under the name of ‘Aristotelianism’, sets out a peculiar version of the Neoplatonic theory of the intellectual procession of the universe. Despite the fact that Albert and Aquinas share a certain language (indifference of essences, the analogy of being, the analogy of reception), they are answering different problems and their philosophical intentions are not congruent. On all important points of metaphysics, therefore, the historiographical notion of an ‘Alberto-Thomist Aristotelianism’ seems quite fragile, if not unfounded.

5 Ethics

In moral philosophy, Albert is a resolute supporter of Aristotle’s view that the ‘contemplative’ or ‘speculative life’ surpasses all other forms of life. Albert describes philosophical contemplation as the height and end of human life. These ideas on ‘intellectual happiness’ were later taken up both by the Latin Averroists (from John of Jandun to Nicoletto Vernia) and by Dante in his *Convivio*. Here again, Albert is close to Averroes and far from Aquinas. Paradoxically, Averroes’ claim that the philosophical life is necessary and pre-eminent (see Ibn Rushd §4) finds its clearest exposition in Albert’s Aristotelianism. It is in Albert’s work that psychology, the science of animate life, manages to grow naturally into a theology, in so far as psychology is in its highest branch a science of human beings, or more precisely in Aristotle’s terms, ‘a science of the most fundamental and best part of the being of men’.

The achievement of Albert’s Aristotelianism, then, is that it naturally links psychology, ethics and philosophical theology. Aristotle’s definition of the humanity of man receives an essentially practical interpretation: what defines man is his aspiration to ‘live according to the noblest part of himself’ (*secundum optimum eorum quae in ipso*). Since this ‘noblest’ (*principale et melius*) part is the intellect (considered both as a ‘divine element present in human beings’ and as ‘what is in the highest degree man himself’) it is by giving a new interpretation of the doctrine of the acquired intellect (*intellectus adeptus*) that Albert builds an ethical system. This ethical system, though it is set ‘against the contemplation of love’ described by Aquinas and theologians, and despite the condemnations of 1277, imposed itself as a kind of corporate ideal to the masters of arts, both Averroists and others.

The new doctrine of the acquired intellect can be easily summarized. The acquired intellect designates the state of the human soul when it is joined (*conjunctio*, *connexio*) to the separated agent intellect. This union can be in

potentiality - since the agent intellect is naturally joined to us as a power and faculty of the soul - or it can be causal - since the agent intellect is the efficient cause of the actualizing of intelligibles in the soul and since, in the acquired intellect, the agent intellect becomes the form of the soul. Their union produces in the soul the state of contemplative wisdom described by Aristotle as ‘the speculative life’. The state of union or speculative life is the state which philosophers define as the ‘supreme end’ of human life, the object of a specific longing (*fiducia philosophantium*). Thus, there is here on earth a form of life which, while it anticipates the happiness promised to the elect in the next world, is none the less self-sufficient (it is in this sense that Alfarabi defines the ‘other life’ as the union of the philosopher with the separated Intellect, in *De intellectu et intellecto* (see al-Farabi)). In the most literal sense of the term, this form of life is ‘acquired’: it is the result of work and implies a progression (*moveri ad continuationem*). The content of this form of life is precisely what Aristotle defined as the object of philosophical theology, the contemplation of the separated beings. The kind of life that is characterized by philosophical contemplation can be called ‘intellectual happiness’.

This conception of philosophy as a contemplative form of life is indissolubly speculative and ethical. Albert arrives at it by drawing from diverse sources, not only the Islamic Aristotelians (Alfarabi, Avicenna and Averroes), but also the Byzantine commentators on the *Nicomachean Ethics*, Eustratius of Nicaea and Michael of Ephesus, whom he was one of the first to read (see Byzantine philosophy). Albert’s often repeated identification of the Arabic doctrine of the acquired intellect (*intellectus adeptus*) and the ‘Greek’ doctrine of the ‘possessed intellect’ (*intellectus possessus*) is meant to establish the authentically Aristotelian character of Albert’s reformulation of the goal of philosophical endeavour. Albert makes his view of this goal an ethical view, by describing philosophy’s culmination as a state which he is not afraid to characterize, with Aristotle, as ‘divine’ (*intellectus divinus*). In comparison with authentic Aristotelianism, however, Albert’s position is marked by something remarkably novel: the idea of an ascetic progression of the human soul, rising progressively from the knowledge of the sublunar world to the intellectual intuition of the separated realities.

The central idea in Albert’s thought is that here on earth, there is a happiness that rewards a philosophical effort understood as a progressive detachment of the human soul from sensible things and the ‘acquisition of the intellect’. Albert’s metaphysics, his psychology, his ethics and his natural theology all converge in this central thought. It is this idea that the so-called ‘Latin Averroists’ in Paris inherited from Albert. It is also, probably, by this aspect of his work that the master of Cologne exerted his most long-lived and varied influence.

Albo, Joseph (*c*.1380-*c*.1444)

Writing in the early fifteenth century, in times of extreme urgency for Spanish Jewry, Joseph Albo presented Judaism as an axiomatic system founded on three primary principles and eight secondary ones. His Sefer ha-'Iqqarim (Book of Principles), sought to defend Judaism against Christian attacks by laying out the basic presuppositions of the Mosaic law.

Albo's theology belongs to a tradition of theorizing going back to Maimonides in the twelfth century. But his approach was grounded in a non-Maimonidean moral psychology. Responding to the Aristotelian intellectualism of the Maimonidean philosophy, which held true belief to be essential to human virtue and salvation, Albo focused on practice, fulfilment of the commandments. His act-centred view, grounded in the premise that beliefs cannot be commanded, allowed for a certain latitude in faith, which had both intra-communal and inter-communal advantages. If controversial doctrines such as ex nihilo *creation could be made less prominent, acrimonious internal debates could be avoided, and the community could be somewhat less exposed to external attack.*

1 Life

We know little about Joseph Albo's life. He lived in Christian Spain, in Castile and Aragon, at a particularly troubled time for Spanish Jewry, a time of religious persecution and forced conversion. There were terrible anti-Jewish massacres in 1391 at Barcelona and elsewhere. Albo represented the Jewish community of Daroca (near Saragossa) at the last of the great public disputations, held in 1413-14, in Tortosa. His Christian adversary, Geronimo de Santa Fé, was born a Jew, Joshua Lorki. This *disputatio*, like others held since the mid-thirteenth century, was not a free-ranging debate between disinterested parties, but an occasion staged by the Church for the public humiliation of Jews. In representing the Jewish side, Albo was defending both Judaism and the Jewish people against a prejudiced, or even predetermined, response. Arraying his arguments in what seemed a hopeless cause, he wrote the *Sefer ha-'Iqqarim (Book of Principles)* in four parts, discussing divine law in general and the Mosaic law in particular. The book was hugely popular in Jewish circles and has never been out of print. Translated into Latin, it was highly esteemed by such Christian thinkers as Grotius for its clear differentiation of natural, conventional, and divine law, a distinction Albo probably learned from his study of Aquinas.

2 Thought and action

Albo's contribution to legal theory finds its context in his engagement with the problems of Jewish dogmatics, the quest to define the fundamental principles of Judaism and to lay out the further principles that derive from them. Maimonides was the first thinker in the rabbinic tradition to posit a set of fundamental doctrines or beliefs incumbent upon every Jew. For Maimonides, these beliefs, thirteen in number, included God's existence, unity, incorporeality and ontic primacy, the uniqueness and irreplaceability of the Mosaic revelation, the coming of a messianic redemption, and bodily resurrection. Belief in these ideas defined the Jew and were necessary conditions for the salvation promised to Israel in the world to come. Disbelief in these principles amounted to heresy.

Superficially, Albo may seem to follow Maimonides in outlining a set of necessary beliefs, differing only in that he distinguishes fundamental from derivative principles. But appearances here are deceptive, for Albo does not adopt Maimonides' premise that beliefs are criteria for identifying a Jew or that nonbelief amounts to heresy. This is not to say that Albo thinks an atheist has a place in the community, but for him, like his immediate predecessors Simeon ben Tzemach Duran and Hasdai Crescas, Albo's teacher, the focus is on acts. Acts make us what we are, and acts, unlike beliefs, can be commanded. The point is not that one can believe just anything and still be a member of the community, but that membership is consequent on acts, fulfilment of the commandments. Albo's account of belief is shorn of the normative weighting of Maimonides' account. He does not lay out what must be believed but treats the articles of faith as the presuppositions underpinning the practical life of a professing Jew.

Albo's act-centred theology rests on an original approach to moral psychology. Maimonides, like Aristotle, thought of human virtue as an expression of reason. It requires a rationally attuned disposition and knowledge suitable to one's endeavour. But this account came under fire in the centuries between Maimonides and Albo. Forced to defend themselves in disputations in terms that would have weight with their opponents, Jews in the fourteenth century came under the influence of Christian scholasticism, which was moving increasingly away from

its Aristotelian and Averroist moorings. With the condemnation of Averroism in 1277, Aristotelian moral psychology gave way to a greater voluntarism like that found in Duns Scotus and William of Ockham. Jewish philosophy mirrored the Christian trend, notably in the case of Crescas. The rejection of intellectualism meant that human felicity was no longer seen as the fruit of intellectual perfection or true belief. As a result, for Albo, as for Crescas, access to salvation takes on a less intellectually elitist cast. A further result of Albo's approach to understanding the principles of Judaism - and indeed of any revealed religion, once these principles are no longer conceived as mandatory dogmas but as necessary presuppositions - is the opening of the way for objective inquiry into revealed religion generally and Judaism in particular.

The *Sefer ha-'Iqqarim* has four parts, an introduction and three books. Its stated purpose is 'to explain those principles which pertain to a divine law in general, the principles without which a divine law cannot be conceived'. Before outlining these principles, Albo explains the need for such a law, relying on arguments as old as Jewish (and Islamic) philosophy itself: 'it is not possible for the human intellect alone to attain a proper knowledge of the true and the good. For human reason is not capable of comprehending things as they are in reality…. There must therefore be something higher than the human intellect by means of which the good can be defined and the truth comprehended so as to leave no doubt. This can be done only through divine guidance. It is incumbent, then, on every person to know that among all laws there is one divine law which gives this guidance' (I.1-2). Only a divine law can take us beyond the objectives of merely utilitarian legislation, which seeks no more than social order and stability, and can open up to us the possibility of our genuine felicity.

All divine law, Albo argues, presupposes three principles: (1) that God exists, (2) that the Torah is divine, and (3) that reward and punishment, both now and in the hereafter, attend our actions. Why does Albo urge that *all* divine legislation presupposes belief in the Torah? Albo's response would be that in fact all monotheistic faiths agree on the divine origin of the Mosaic law, although Christianity and Islam hold that the Mosaic legislation has been superseded. The polemical context that provides the background of Albo's writing is strikingly clear here. But it is important to Albo (partly because of his defensive posture) not to confine his argument suppositiously to parochial assumptions. His intention is to move from the more general to the more particular by specifying the implications of the basic principles. Thus, from his three general or 'root' principles (*'iqqarim*), he derives eight derivative principles, also called roots (*shorashim*). The denial of any one of these latter principles 'is tantamount to a denial of the fundamental principle from which it is derived'. From God's existence, he derives God's (1) unity, (2) incorporeality, (3) atemporality, and (4) perfection. From the divine origins of the Torah, he derives (5) God's wisdom, (6) the possibility of prophecy, and (7) the authenticity of the mission of the historic prophets. From the reality of reward and punishment, he derives (8) divine providence and knowledge of human actions and events.

Even these derivative principles are quite generic. None is distinctive to Judaism. But their derivation from the first tier allows Albo to deny the consistency of Christianity: if God's unity follows from his existence, Catholics should deny the Trinity, lest their view call into question the very existence of God.

A third set of beliefs are called branches (*'anafim*). They are (1) *creatio ex nihilo*, (2) the superiority of the Mosaic prophecy, (3) the irreplaceability of the Torah, (4) the possibility for a human being to attain perfection by fulfilling even a single commandment, (5) resurrection of the body, and (6) messianic redemption. For Albo these six doctrines are not derived from the others but are peculiar to Judaism, traditionally taught and accepted. A divine law can exist without these six 'branches'.

The secondary status of these beliefs seems to allow Albo to defuse the traditionally acrimonious intra-communal debates over such issues as *creatio ex nihilo*. This is not to say that Albo supposes that the tradition does not teach *creatio ex nihilo*, but it does mean that he does not take God's perfection to be inconsistent with the creation of the world from pre-existent matter, as Plato was held to have taught. Those who held to the Platonic doctrine of *formatio mundi* would not, as a result, have to be construed as implying the denial of a fundamental principle - as Trinitarians were. Again, the downplaying of messianism may reflect a reaction against the centrality of that theme in Christianity. Albo's special principles, then, both ground the particularity of Judaism and mitigate the intensity of intra-confessional theological debates.

3 Contribution to Jewish philosophy

Albo comes late in the history of Jewish dogmatics. His contribution lies in the architectonic he constructs for

Jewish faith and practice. Maimonides and others present the principles of Judaism on an equal footing. Albo offers a hierarchically graded, logically structured schematization. The structure is designed both for internal strength and for defence against external attack. The scheme allows Albo to contextualize Judaism generically as a divine law but also to render less vexed the internal debates over the niceties of those beliefs that are distinctive to Judaism. Albo's treatment of core beliefs not as axioms but more as themes whose appeal is traditional, but whose nexus to the canonical axioms is not one of entailment, is appreciated by contemporary students of Judaism for fostering a certain openness with respect to belief without departing from the larger axiomatic structure that Albo used in helping to define his faith and to defend it.

Alchemy

*Alchemy is the quest for an agent of material perfection, produced through a creative activity (*opus*), in which humans and nature collaborate. It exists in many cultures (China, India, Islam; in the Western world since Hellenistic times) under different specifications: aiming at the production of gold and/or other perfect substances from baser ones, or of the elixir that prolongs life, or even of life itself. Because of its purpose, the alchemists' quest is always strictly linked to the religious doctrine of redemption current in each civilization where alchemy is practised.*

In the Western world alchemy presented itself at its advent as a sacred art. But when, after a long detour via Byzantium and Islamic culture, it came back again to Europe in the twelfth century, adepts designated themselves philosophers. Since then alchemy has confronted natural philosophy for several centuries.

In contemporary thought the memory of alchemy was scarcely regarded, save as protochemistry or as a branch of esotericism, until interest in it was revived by C.G. Jung. Recent research is increasingly showing the complexity of alchemy and its multiple relation to Western thought.

1 Name and definition

The name 'alchemy' appeared in Islamic culture, whence it passed to Latin. It evolved (apparently) from the Greek 'chemèia' (art of melting metals) or 'chymos' (juice). An alternative etymology, supported by the Hermetic tradition, indicates 'kemi' (black clay), the ancient name of Egypt, pointing to the mythological link with the god Hermes-Thoth.

Initially alchemy denoted both the art and its product; this latter use, however, is rare in the Western tradition. As a name indicating the art or *opus*, its meaning varies depending on the period referred to: originally it designated the practical and theoretical search for transmutation, whereas in contemporary esotericism it indicates the concrete achievement(s) associated with a pre-eminently spiritual quest.

Accordingly, the decision about what is an alchemical text or an alchemical image may differ: we distinguish a historical, an esoteric and a psychological approach. Historians consider written tradition (manuscript and printed texts and images) the one and only testimony of a doctrine evolving in time. For esotericists, this same tradition is nothing but the surface of a secret, immutable knowledge, often deliberately disguising its truth. For depth psychology alchemy encompasses virtually every kind of symbolic production.

The definition given by H.J. Sheppard (1986), currently the most widely accepted, takes into account all approaches: ' Alchemy is the art of liberating parts of the Cosmos from temporal existence and achieving perfection which, for metals, is gold, and for man, longevity, then immortality and, finally, redemption'.

2 Epistemological structure

The association of practice and theory characterizes alchemy from its very beginning and distinguishes it from other symbolic lore. Archaic metallurgy, in its connection with religious rites, is generally considered the cradle of alchemy: this opinion has accounted for the religious and even mystical elements in alchemy since the work of Zosimus of Panopolis (*c*.3-4 AD). Yet the earliest acknowledged alchemical text (Bolus of Mende, pseud. Democritus, *Physikà kai mystikà c*.1 AD) shows that just those metallurgical practices imbued with religious significance were the basis on which a theory of matter was beginning to be built: a theory derived from practice, not the contrary.

Indeed, the dependence of theory on practice marks the whole history of alchemy. For its theoretical content, Western alchemy was called 'the child of Greek philosophy', but we cannot accept such a genealogy without remembering that there was also another 'parent', namely, concrete work on matter. In the Middle Ages, as practical alchemy interacted with the development of techniques and craftmanships (metallurgy, goldsmith, dyeing, pharmacology), it was first considered an 'ars mechanica', but soon its theoretical meaning became clear to philosophers like Albert the Great and Roger Bacon, and the close connection between alchemical practice and religious-philosophical speculation continued with Paracelsus and the Rosicrucians, with Newton and Goethe (see Paracelsus §3).

Therefore we cannot speak of alchemy proper where we find only a practice, be it metallurgy, distillation or whatever else: the dyeing recipes of medieval painters, or distillation among Renaissance physicians. However, we must be equally careful not to speak of alchemy too readily whenever alchemical symbolism is used for other purposes: for example, by mystics.

The connection between practice and theory accounts for, and delimits, the contribution of alchemy to the birth of chemistry (see Chemistry, philosophical aspects of §1). Like ancient artisans, who owned secret techniques transmitted through apprenticeship, alchemists were secretely initiated to the *opus*. The secrecy of alchemy is a major point of divergence from chemistry, which, like all modern sciences, is characterized by public discussion and teaching. Moreover, although alchemists for centuries worked with metals and minerals, invented techniques (for example, distillation), designed and used laboratory apparatus that chemists would inherit, they never relinquished their original religious attitude; as a consequence of this, theoretical developments were radically different from those of modern chemistry. Basically, for alchemists, matter was no inert object but the body of their own Mother Nature. So there is no epistemological continuity between alchemy and chemistry; protochemical features may be disentangled only a posteriori from a doctrinal whole owing its orientation to totally different ideas and purposes.

3 Features of the alchemical literature

The initiatory character of alchemical teaching accounts for the most striking feature of the language of alchemists, that is, the use of a rich symbolism. Metaphorical names for substances and processes were used from the beginning, an attitude reinforced by Arab alchemists and complicated by the obvious difficulties of Latin translators. The use of metaphors met the need for secrecy and facilitated the merging of operative and religious meaning; but it also prevented the creation of a technical vocabulary (another major difference from chemistry) and fostered the transformation of alchemy into an occult art.

This retreat into the occult, accompanied by the development of alchemical imagery, began at the end of the Middle Ages, when metallurgical alchemy was defeated by the denunciation of alchemists as forgers and the idea of the medical elixir began to be associated with the prophetic and visionary mood of the Spirituals. So, while many medieval texts were written in a clear language and even, sometimes, in a truly philosophical style, the number of obscure writings playing with symbols and visions increased steadily from the fourteenth century. Later alchemists went further, explicitly linking their art to ancient mythology and eventually wholly replacing words with images.

Thus the main difference inside alchemical literature is between clear and obscure texts. Various genera belong to the first group: recipes, practical treatises, theory and practice texts, commentaries, veritable summae; rarely does their 'clear' character match our modern demands for clarity. Obscure texts comprise mainly visions, riddles, and poems.

A relevant feature of the alchemical literature, since its very origin, is its pseudoepigraphical character, often connected to the creation of legends concerning the supposed authors of alchemical writings. By means of pseudoepigraphy alchemists clearly attempted to enrol themselves in the philosophical tradition, albeit awkwardly. Texts were attributed to pagan gods, mythological and biblical figures, ancient and medieval philosophers. Such attributions assured secrecy, while raising the prestige of writings of obscure authors; they might even be a subtle indication of affiliation.

4 Alchemical doctrines

The basic idea of alchemy is the identity of nature and first matter as a dynamic unity: elements can pass one into another, in a circular movement that alchemists reproduced in their vessels. No theory of natural *loci* (low and high are interchangeable, according to the *Tabula smaragdina c*.9 AD), no dualism of matter and spirit exists, as first matter is the all-embracing source of change. The alchemist, who can obtain first matter by means of the dissolution of natural bodies, is almost a new creator who makes a new reality come out of the artificially produced chaos 'putting nature into nature', that is, cultivating the seeds of perfection existing in nature (perfect metals) according to natural rules, and 'awaiting nature's time of delivery'. (R. Llull, *Testamentum c*.14 AD).

This structure is first seen as continuity inside the inanimate field of metals, and as analogy between metals and planets: all metals are nothing but imperfect gold (like embryos at various stages), and the alchemist accomplishes nature's work outside the womb of earth in a shortened time, possibly within an astrological framework. Some alchemists viewed the process as a victory over nature and time, foreshadowing the Promethean developments of modern science and technology: there are some hints that medieval theologians rebuked alchemy for this claim. Yet the relation between alchemical art and nature's work was generally considered in a more subtle and complex way, especially in the theoretical attempts made by fourteenth-century alchemists who developed the idea of elixir. Continuity from inanimate matter to human beings was explicitly or implicitly affirmed, and the alchemists were conscious of themselves as a part of the matter/nature that they manipulated in order to perfect, not to dominate. This consciousness preserved their attitude of religious reverence for nature, whose abandonment was a major feature of modern science.

5 Alchemy and Western philosophy

Discussing matter and its transformations, alchemists encountered philosophical themes from the beginning. There have even been attempts to trace back alchemy to Aristotle's idea of change in material substances (see Matter §1), but actually alchemy (practice plus theory) was not yet born. In later Antiquity an especial relationship existed between alchemy and Hermetic thought (see Hermetism): the unity of first matter, the principle of sympathy, the doctrine of occult virtues, all are behind Bolus' axiom that 'Nature is charmed by nature, nature prevails over nature, nature rules nature'. The Stoic doctrine of *pneuma* lingers on in the search for material essences through distillation, a practice that goes back to Maria the Jewess (*c*.3 AD) (see Stoicism §4).

Medieval developments were considerable, as scholastic philosophers and alchemists compared alchemy to the Aristotelian philosophical concepts. According to Albert the Great (*De mineralibus c*.13 AD) alchemy helped to complete the Aristotelian science of metals. Roger Bacon showed a broader concern, viewing alchemy as the general theory of generation and corruption of all natural beings. Some alchemists even tried to translate into Aristotelian language their experience, identifying form with the purest and thinnest substance (quintessence) resulting from sublimation or distillation. How much of Stoic natural philosophy intermingled with Aristotelian ideas in this attempt is unclear. Form was also identified with the soul, so that all material bodies, metals included, were considered endowed with a soul; body and soul were kept united by spirit, an idea which the alchemists could also find in medical literature, and developed into that of the universal 'medium' that gives unity and life to the created world.

The Hermetic elements had never disappeared from Western alchemy, as the central role of the *Tabula smaragdina* shows; during the Renaissance, they became prevalent. Alchemical doctrines were known to virtually every Renaissance philosopher, discussed by most of them, accepted by many. The relation between Renaissance Platonism and alchemical thought might be considered afresh, as alchemy is a project to obtain on earth the stability and perfection that characterize the Platonic world of ideas, manipulating the universal spirit that mediates between matter and the divine world. The most significant development, however, can be found in Paracelsus, whose idea of 'making visible the invisible' rests on the alchemical assumption that the quintessence of material bodies can be revealed through the *opus*. So, Paracelsian alchemy aimed at revealing the secret of life and putting it to work for the spiritual and bodily health of humans. More definitely, the idea of an alchemical remedy or elixir crystallized in that of potable gold, which interested Ficino and Francis Bacon among others.

In the seventeenth century, Francis Mercurius van Helmont turned the idea of the universal spirit into that of alkahest, the basis for subsequent chemical developments which ultimately led to the discovery of oxygen. Newton's alchemical and cosmological speculation about the creative, non-mechanical spirit animating matter is at the core of the debate about the role of Hermetism in the Scientific Revolution. The re-emergence of Stoic ideas concerning first matter and mixed bodies in seventeenth-century alchemy has recently been considered to establish it as part of the normal science of that epoch. Even after the birth of modern chemistry, alchemy maintained its appeal to speculative spirits: Goethe apart, we have the clear instance of the subsequent development of *Naturphilosophie* in nineteenth-century Germany (see Naturphilosophie), with alchemical doctrines flowing into the mainstream of vitalism (see Vitalism). More surprising perhaps is to find alchemy defined in the *Encyclopédie* as chemistry brought to the highest degree of perfection and therefore capable of operating marvellous effects, 'la chimie sublime, la chimie par excellence'.

6 Alchemy and the present

Nineteenth-century scholarly research on protochemistry overlapped with the latest development of esoterical alchemy (hyperchemistry). Historians of chemistry judged alchemy a mix of positive empirical data about chemical matter with obscure mystical speculation. An echo of their attitude is still felt in the consideration of alchemy as an error in the history of science, indeed, according to Bachelard, 'the first error' in the scientific approach to the problem of matter.

Alchemy attracted the attention of C.G. Jung as a historical testimony of the dynamics of the unconscious. Jung's deep study of alchemy led him first to conceive of it as the projection upon matter of the unconscious tendency to individuation; but he also saw in alchemy the expression of a more complex relation between humanity and nature, where matter is recognized as the feminine counterpart of the divine, and human knowledge is fostered by the very light of nature (a Paracelsian idea), comparable to the light of Revelation. Thus Jung gave a positive value to the link between religious attitude and empirical research in alchemy. On the other hand, the idea of the alchemists as forerunners of the modern ideal of the scientist who overcomes nature and time is at the core of M. Eliade's (1956) view of alchemy as an intermediate stage between archaic metallurgy and modern technology.

Recent proposals from within French esotericism bear on epistemology and aesthetics: A. Faivre's (1971a) conception of the non-dualistic logic of alchemy links it to the most advanced results in the epistemology of physics, while F. Bonardel (1993) defines the alchemist's attitude as taking charge of the created world. She opposes the Promethean-Faustian view of alchemy, and deplores its gradual fall from the original position of the art of Hermes, proposing its identification with poetry. Another contemporary way of stressing the Hermetic meaning of alchemy is that of focusing on its figurative symbolism, not only in the images linked to alchemical texts or in the alchemical interpretation of artists of the past, but even in defining the creative process of contemporary art as alchemy.

Alcinous (*c.* 2nd century AD)

Long misidentified with the Middle Platonist philosopher Albinus, Alcinous is author of a 'handbook of Platonism', which gives a good survey of Platonist doctrine as it was understood in the second century AD. The work covers logic, physics and ethics, and shows considerable influence from both Stoicism and Aristotelianism, in both terminology and doctrine, while remaining in all essentials Platonic.

A Middle Platonist philosopher, Alcinous was the author of the *Didaskalikos tōn Platōnos dogmatōn* or 'instruction manual of Platonic doctrine'. He was long identified with the second-century Platonist Albinus, author of an extant introduction to Plato's dialogues, but this identification has been recently abandoned. In consequence, we know strictly nothing of the life or times of this author, nor even whether the name may not be pseudonym. None the less, he seems to fit best within the environment of second-century AD Platonism.

The work *Didaskalikos*, purporting to be a summary of Plato's doctrines, possesses its real value as a summation of the doctrines of at least one school of later Platonists. It presents a concise survey of Platonist doctrine, in thirty-six chapters. After three introductory chapters, concerned respectively with the definitions of philosophy, the laying down of requirements for the successful philosopher and an enumeration of the 'parts' of philosophy (logic, physics and ethics), Alcinous proceeds to take these topics in order, beginning with logic in chapters 4 to 6. Chapters 7 to 26 deal with 'physics', and comprise both an account of first principles, 'matter, form and god' (7-11), and one of the physical world; the latter is very closely based on the *Timaeus* (12-26), although Alcinous holds to a non-literal interpretation of the demiurgic creation myth. The final chapters, 27 to 34 are concerned with ethics.

A good deal of both Peripatetic and Stoic doctrine and formulation is incorporated into the exposition, although normally supported by the adducing of Platonic texts. However, all of Peripatetic logic is claimed for Plato, as well as such Aristotelian ethical principles as the mean, and *metriopatheia* (moderation of the passions). On the other hand, such Stoic concepts as the self-sufficiency of virtue and the concepts of *euphyiai*, or 'good natural dispositions', and *prokopē*, or 'moral progress', are also adopted. Alcinous' position on free will and determinism (ch. 26) also owes a good deal to Stoic theorizing, although Stoic determinism is firmly rejected. On the whole, Alcinous inclines to the Peripatetic rather than to the Stoic wing of Middle Platonism.

Distinctive features of his doctrine are his theology (ch. 10) and his views on the reasons for the embodiment of the soul (ch. 25). In Chapter 10 we find a hierarchy of principles set out, consisting of a supreme god, who is a transcendent intellect, an intellect of the world-soul, and the world-soul itself, which seems to be only rational by participation, after being 'roused up' by the supreme god. This is comparable to other Middle Platonic systems observable in Plutarch and Numenius, but the relationship between the principles is distinctive to Alcinous.

In Chapter 25 we find an interesting list of possible reasons for embodiment, giving evidence of considerable debate on this question, and a theory of three faculties of disembodied souls not found elsewhere. In general, a frustrating aspect of the *Didaskalikos* is the evidence it gives of active philosophical debate within Platonism in this period, while not preserving the actual arguments; but that is inherent in the nature of the work.

Alcmaeon (*c.* early to mid 5th century BC)

Alcmaeon of Croton was a Greek thinker with philosophical and medical interests. His work focused on the nature of man. Health was the outcome of 'equal rights' between, for example, hot and cold, moist and dry, disease that of the 'monarchy' of one of them. 'Passages' linked the sense organs to the brain, which Alcmaeon took to be the seat of sensation and understanding. Plato followed him in this view, as also in his proof of the immortality of the soul from its continual motion.

Was Alcmaeon a philosopher or a doctor? The interests revealed in our information about his views, some controversial evidence that he practised dissection and the existence in the southern Italian city of Croton of a medical tradition, famous from the sixth century BC, all suggest a doctor. But Croton was also the centre of Pythagoras' activities; and Aristotle and Theophrastus present Alcmaeon as a philosopher. The book Alcmaeon wrote was probably 'on the nature of man' (as later authors might have titled it). Its opening words survive. They include a dedication to three persons believed in later antiquity to be adherents of Pythagoreanism, although Aristotle implies that, despite some similarities, Alcmaeon was not a Pythagorean himself. In sum, Alcmaeon has the look of an independent thinker who responded creatively to a number of the intellectual currents of his time and place.

The doxographer Aëtius gives a striking exposition of Alcmaeon's theory of health and disease:

> Alcmaeon maintains that what sustains health is the 'equal rights' of the powers, moist and dry, cold and hot, bitter and sweet and the rest, while 'monarchy' among them is what causes disease; for the monarchy of either one of a pair is destructive.
>
> (fr. 4)

The use of political metaphor was presumably Alcmaeon's own. Explanatory appeal to opposite powers is a pervasive and fundamental feature of Presocratic thought, but it was here that Aristotle perceived a particular similarity - if also a dissimilarity - with the Pythagoreans' systematic listing of key contrarieties (see Pythagoreanism §2). He ascribes to Alcmaeon the generalizing remark that most things to do with human beings come in twos, yet apparently found in him no attempt to construct a single system of opposites (*Metaphysics* I 5).

Alcmaeon is credited with three notable contributions to the psychology and physiology of the senses. First, humans differ from other animals in that they alone have understanding as well as sense perception (A5). Most Presocratic thinkers treat animals, too, as exercising intelligence. Second, the senses, as Alcmaeon argued case by case, are all connected by 'passages' to the brain, which is conceived of as the seat of sensation (A5). Other Presocratics (for example, Empedocles) identify this seat with the heart. Third, he is said to have been the first person to have performed an *exsectio* (A10). Probably this Latin term means not that he initiated a general medical or scientific practice of dissection, but merely that once he cut out the eyeball of a dead animal in an attempt to verify his theory of 'passages', and thereby revealed the existence of what we call the optic nerve. Some scholars reject the authority of the report. If accepted it confirms the importance Alcmaeon says he attaches to using signs to interpret what is unapparent (fr. 1): which is not, however, the same as subscribing to a methodology of rigorous empiricism.

What sets Alcmaeon apart from the general run of early medical writers is his willingness to theorize about the soul. Aristotle reports his view in these terms:

> He says that the soul is immortal owing to its similarity to the immortals, and that this is true of it because it is always in motion - for everything divine is always in continuous motion: moon, sun, the stars and the whole heaven.
>
> (*On the Soul* I 2)

One testimony suggests in addition that Alcmaeon derived the continual motion of the soul from the capacity of living things for *self*-movement (A12). Another assures us that according to Alcmaeon humans die because they cannot join the beginning to the end (fr. 2). This obscure saying perhaps indicates the way the irreversible process of ageing makes human beings - as opposed to their souls - unlike the heavenly bodies, which continue in motion

by everlasting repetition of their revolution in the heavens. This group of texts furnishes evidence of the first attempt we know of to *argue* the Pythagorean doctrine of the soul's immortality.

Alcmaeon's argument for the immortality of the soul is clearly what supplied the inspiration for Plato's proof in the *Phaedrus* (245c). His identification of the brain as the seat of sensation was also accepted by Plato, after previous development by Diogenes of Apollonia (§3) and in the Hippocratic treatise *On the Sacred Disease*. Aristotle notoriously took a different view, but even he borrowed from Alcmaeon's ideas; for example, on the cause of sleep. As for Alcmaeon's theory of health and disease, there are reflections of it in various early Hippocratic writings such as *On Ancient Medicine*.

al-Dawani, Jalal al-Din (1426-1502)

Jalal al-Din al-Dawani was a prominent philosopher and theologian from Shiraz, who came to the note of Western scholars through an English translation of his ethical treatise theAkhlaq-e Jalali (Jalalean Ethics), published in 1839. Although the larger part of his work written in Arabic has been little studied, he did write extensively and engaged in a famous and lengthy philosophical dispute with another leading philosopher, Sadr al-Din al-Dashtaki. His metaphysical views were quoted, and refuted, by Mulla Sadra. He emerges as a thinker who combined elements of illuminationist and Peripatetic philosophy (and possibly also interests in Ibn al-'Arabi) to confront theological, ethical, political and mystical concerns.

Jalal al-Din Muhammad ibn As'ad al-Dawani (or Dawwani) was born near Kazarun, southern Iran, in the village of Davan in AH 830 (AD 1426). He first studied there with his father, who had been taught by the Sayyid al-Sharif al-Jurjani (d. AH 816/AD 1413), before going on to further and complete his education in philosophy, theology and law in Shiraz. In common with the other leading religious scholars of his time and place, he was directly caught up in the turbulent politics of Iran in the second half of the ninth century AH (fifteenth century AD). He was inducted into various religious offices, and many of his works were dedicated to Aq Qoyunlu and other Timurid rulers and princes. He also achieved fame as a teacher in the Begum *madrasa* (Dar al-Aytam) in Shiraz. The question of his religious allegiance, whether Sunni or Shi'i (he wrote theological works of both persuasions), has always been the subject of debate and of many fanciful stories, but it may be of comparatively slight significance given the situation in the Iran of his time, which was marked by a Sunnism with a strong Shi'i colouring. He died in AH 908/AD 1502 near Kazarun, a year or so before the Safavid capture of Shiraz, and is buried in his home town.

Al-Dawani first came to the attention of Western scholarship through the 1839 English translation of his Persian ethical work, the *Akhlaq-e Jalali (Jalalean Ethics)*, more correctly known under its original title of *Lawami' al-ishraq fi makarim al-akhlaq (Lustres of Illumination on the Noble Virtues)*. Al-Dawani's text marks a third stage in the development of the ethical strand of writing begun by Ibn Miskawayh with the *Tahdhib al-akhlaq (Cultivation of Morals)* and continued by Nasir al-Din al-Tusi with his *Akhlaq-e Nasiri (Nasirean Ethics)*, on which al-Dawani's work is closely modelled. Al-Dawani retains al-Tusi's division of the text into three sections - ethics, economics and politics - and subdivides his work similarly, although significantly he entirely omits al-Tusi's theoretical first section of the ethics. The title, *Lawami' al-ishraq (Lustres of Illumination)*, may indicate the author's *ishraqi* (illuminationist) and mystical concerns. The political content of the work has been of some interest to historians, as regards both its descriptions of the ideal ruler and the titles used for its dedicatee, the Aq Qoyunlu Uzun Hasan, which betray a possible *ishraqi* influence and seem to foreshadow the extravagant claims of Isma'il, the first Safavid monarch of Iran.

The *Akhlaq-e Jalali* is generally acknowledged to be a less satisfactory work than al-Tusi's, being weaker in argument and encumbered with anecdotal material (following the literary taste of the period) from both Greek (indirectly) and Islamic sources, being more 'Ciceronian', as its 1839 translator, W.F. Thompson, apologetically expressed it. It is therefore easier to admire the work for its style than for its intellectual rigour. Thompson's translation does not improve matters, thanks to its baroque literary style and ponderous sentiments.

Apart from the *Akhlaq-e Jalali*, over seventy-five works by al-Dawani are recorded, covering the fields of philosophy, mysticism, theology and exegesis. Of particular interest to subsequent philosophers were his commentary on al-Suhrawardi's *Hayakil al-nur (The Temples of Light)*, *Shawakil al-hur fi sharh Hayakil al-nur (The Houri's Haunches in Commentary of the Temple of Light)* and his series of glosses on the commentary by 'Ala' al-Din al-Qushji (d. AH 879/AD 1474) on al-Tusi's *Tajrid al-kalam (Abstract of Theology)*. In both works he engaged with his contemporary Sadr al-Din al-Dashtaki (and subsequently the latter's son Ghiyath al-Din). All three were greatly influenced by al-Suhrawardi, although the Dashtakis perhaps more than al-Dawani. Sadr al-Din denied any reality to existence, either mental or extramental, and could thus be described as an extreme essentialist. Al-Dawani, on the other hand, held a view which harks back to Fakhr al-Din al-Razi. Existence in the outside world, for al-Dawani, is a single necessary reality, absolutely devoid of multiplicity, and is thus equal to God. Everything else is contingent: 'entities' whose existence is not real but only various 'portions of existence' (*hisas*) conceived by the mind. The reality of the external world is established solely through quiddities.

Al-Dawani's illuminationism is thus a modified one, but it proved more influential than al-Dashtaki's extreme form, for it was adopted by Mir Damad and initially by the latter's pupil Mulla Sadra before he turned to his radical existentialism.

Alemanno, Yohanan ben Isaac (1433/4-after 1503/4)

An outstanding Jewish thinker of the Italian Renaissance, Alemanno combined an eclectic Jewish philosophic rationalism, steeped in the medieval sources - Maimonidean, Averroist and Kabbalistic - with Renaissance humanism and Neoplatonism. He was an Aristotelian and Maimonidean in ethics, a Platonist and Averroist in political philosophy and a Neoplatonist and Kabbalist in metaphysics. His fusing of Aristotelian rationalism with Platonizing mysticism is striking but not atypical for the period. Influenced by Renaissance thought after he settled in Italy, he was active in Christian as well as Jewish circles in Florence, Padua and Mantua. Pico della Mirandola learned Hebrew under his instruction and relied on him for access to medieval Jewish texts in philosophy and Kabbalah. Both Christian Kabbalah and Renaissance Hebraism were products of the interactions in which Alemanno was a chief participant. His ties to the Florentine Academy of the late 1480s are evident in his adaptations to Jewish thinking of the ideas current among its members as to the unity of truth, the immortality of the soul and the dignity of man.

1 Life and background

Like many of his philosophical contemporaries, Alemanno was an immigrant to Italy. His name is an Italianized rendering of the surname Ashkenazi. He was born in Paris and died probably in Mantua. The work of such immigrants had a profound intellectual impact on the Italian Jewish communities of the latter Middle Ages and the Renaissance. Their influence was also felt on Renaissance culture at large. Like most of his scholarly Jewish contemporaries, Alemanno was a wandering scholar who travelled in search of a livelihood as a private teacher, preacher or secretary, always seeking the patronage of influential Jewish financiers. While wandering among such cities as Florence, Mantua, Padua and Bologna, he met many of the leading Jewish scholars of his time, including Judah Messer Leon, author of the *Nofet Tzufim (The Book of the Honeycomb's Flow)*, an important rhetorical treatise that aimed to integrate biblical rhetoric with the revived Ciceronian tradition of the Renaissance. Messer Leon's work profoundly influenced Alemanno, leading to his discovery of the full gamut of Renaissance humanist and Neoplatonic ideas and to his contacts with such leading exponents of Renaissance humanism as Giovanni Pico della Mirandola, his nephew Alberto Pico and Girolamo Benivieni. These scholars, especially Pico della Mirandola, relied on Jewish scholars like Alemanno, Elijah Delmedigo and Abraham Farissol, to learn Hebrew and to gain access to the sources of Jewish philosophy, the fascinating materials of Kabbalah, and the works of such Islamic thinkers as Averroes (see Ibn Rushd), which their Jewish guides translated for them into Latin from the medieval Hebrew and Arabic texts. The collaboration of Jewish with Christian scholars led to the creation of a Christian Kabbalah and was the foundation of Renaissance Hebraism.

Alemanno and other Jewish scholars cultivated their contacts with the humanists not only as an avenue to patronage, but also for the knowledge it gave them of the latest developments in literature, philosophy, medicine, politics and magic (see Humanism, Renaissance). Alemanno was particularly interested in such current learning and in transmitting it to his Jewish students and audiences. While Averroists like Delmedigo held suspect the mystical tendencies of Christian Neoplatonism, Alemanno eagerly pursued them. Commissioned by Pico in the late 1480s, the heyday of the Platonic Academy which Marsilio Ficino had established at Florence (see Platonism, Renaissance), Alemanno wrote his *Heshek Shelomo (The Passion of Solomon)*, an allegory on the Song of Songs and one of the first expressions of the Renaissance ideal of Platonic love, enunciated in Ficino's contemporaneous commentary on Plato's *Symposium*. Jewish exegetes had traditionally read the Song of Songs as an allegory of the spiritual love between God and Israel. That reading was now re-visioned through a Neoplatonic prism, in many ways anticipating the approach of Judah Abravanel (Leone Ebreo) in the *Dialoghi d'Amore (Dialogues of Love)*. In the foreword to his long introductory essay, *Shir ha-Ma'alot le-Shlomo (The Song of Solomon's Ascents)*, Alemanno describes his contacts with Pico at length, and portrayed Lorenzo di Medici, the patron of the Platonic Academy, as the living embodiment of the Platonic-Averroist philosopher king. In the text itself, King Solomon is made the prototype of the ideal philosophical ruler.

2 Writings

Most of Alemanno's writings survive today only in manuscript. *Shir ha-Ma'alot le-Shlomo* has been printed, but the early editions are partial and inaccurate. Of Alemanno's other writings, only a few extracts have appeared in

scholarly papers.

His most important work is *Hai ha-Olamim (Immortal Life)*, a work influenced in its construction by Ibn Tufayl's *Hayy Ibn Yaqzan (The Living Son of the Vigilant)* (see Ibn Tufayl). Alemanno in fact wrote a supercommentary on Moses of Narbonne's commentary on this work, most probably for a translation of the work from Hebrew to Latin commissioned by Pico. *Hai ha-Olamim* takes the form of a Platonic dialogue between a plain speaker and a philosopher, which unfolds in painstaking detail the development of the perfect individual, from his creation in the womb, through his physical, moral, political and intellectual development, until he reaches mystical union with God. As the title suggests, the soul of this perfect individual will become an immortal, *Hai ha-Olamim*. The description of his physical and moral perfection follows the Aristotelian tradition; that of his political perfection, mainly the Platonic tradition - all, of course, as seen through the eyes of medieval Muslim and Jewish intermediaries. With the approach to spiritual perfection, the Neoplatonic and Kabbalistic elements intensify, and the discussion ends on a powerful mystical chord.

Alemanno's other major work, *'Enei ha-'Edah (The Eyes of the Community)*, is a commentary on the Pentateuch through Genesis 5:1 and was probably linked originally to Pico's *Heptaplus de opere sex dierum Geneseos (On the Sevenfold Narration of the Six Days of Genesis)*, which deals with the same text and issues and was composed at the same time, in the late 1480s. His *Liqqutim (Compendia)*, comprises notebooks containing early drafts of his mature writings and important data on his life and intellectual background.

3 Philosophy

Rejecting what he saw as a medieval dichotomy between faith and reason, revelation and philosophy, and reacting against the widely bruited Christian Averroist notion of a double truth, Alemanno, like Pico, proclaimed the unity of truth and strove to harmonize philosophy, *halakhah*, Kabbalah, alchemy and astrology (see Halakhah; Kabbalah; Alchemy; Averroism, Jewish). His synthesis depended on ranking the various disciplines, spheres of existence and virtues in a hierarchy that acknowledged a dynamic relationship of emanation and love between the Creator and creation, and on making frequent analogies between matter and spirit, animal and man, microcosm and macrocosm, the Neoplatonic Intelligences and the Kabbalistic Sefirot (mystic Neopythagorean hypostases that mediate between the Infinite and creation). The heavy reliance on hierarchy and analogy generates a thick amalgam of ideas, in which Alemanno tried, often without success, to validate Neoplatonic theses by way of Aristotelian methods and typologies.

In the face of the esotericism fostered by medieval Jewish philosophers and Kabbalists, and insisted upon by many irate contemporaries, Alemanno addressed his writings to the widest possible audience, as is shown not only by his own declarations but also by his typically humanist attention to style and exposition. His model was the prophetic programme of addressing the entire community, each member in accordance with his highest understanding. For thinkers imbued with the values and practices of medieval Jewish philosophy, such exposure of the higher reaches of tradition to anyone who would listen was palpably subversive, but the aura of revealing long hidden secrets may explain the special interest that Pico and other Christian humanists took in Alemanno.

Central among the mysteries to be made known was the Platonic or Neoplatonic theory of the immortality of the soul, a core topic for the Florentine Academy. Following the teachings of medieval Jewish thought, both philosophical and Kabbalistic, Alemanno identified the soul's immortality with its knowledge of the one eternal truth that puts us in contact with the 'active intellect' and allows us to share the eternity of the Platonic Forms. But unlike many medieval thinkers who tended to limit this possibility to a handful of philosophers, Alemanno strove to widen it to the whole community, giving them access not only to physical resurrection, with the coming of the messiah, but also to spiritual immortality. Alemanno's teaching, preaching and lecturing was not only a quest for a livelihood, but also a vocation, a quest to disseminate knowledge, and so immortality, as widely as possible.

Not surprisingly, Alemanno adopted the Florentine theory of the dignity of man. He dovetailed Ficino's assignment of man to the mid-rank of being, between the bestial and the Divine, with Pico's insistence that while each created being has its proper place in the chain of being, only humans hold all the possibilities of existence. They can choose to descend into bestiality or raise themselves towards the Ideas and God. Alemanno, however, found limits to this freedom in the play of astral influences, and he was less sanguine than Pico as to our ability to make sound choices. In addressing this problem of human moral weakness, which a Christian thinker might have

interpreted in terms of original sin, Alemanno fell back on Jewish tradition: following Maimonides, he argued that the Commandments can steady our irresolution. But this meant that only Jews can properly use their freedom to attain the moral perfection that human beings need to achieve intellectual perfection and so be linked to the Sefirot and gain immortality.

Alexander of Aphrodisias (*fl. c.* AD 200)

The Peripatetic philosopher Alexander was known to posterity as the *commentator on Aristotle, until Averroes took over this title. His commentaries eclipsed most of those of his predecessors, which now survive only in scattered quotations. Used by Plotinus, Alexander's commentaries were the basis for subsequent work on Aristotle by Neoplatonist commentators, and even though some themselves survive only in quotations by these later writers, Alexander's interpretations of particular passages are still helpful and are cited by commentators today.*

In addition to Alexander's commentaries we have a number of monographs, and also collections of short discussions which are connected with themes in his writings, though some are probably by pupils rather than by Alexander himself. Alexander's most influential and controversial doctrine has been his interpretation of Aristotle's theory of soul and intellect; regarding the soul as the product of the mixture of the bodily elements, he has been seen as subordinating form to matter and as thereby misinterpreting Aristotle. Certainly his view excludes any immortality for individuals, but even if Aristotle himself allowed this it is arguable that to do so was incompatible with his definition of soul as the form of potentially living body. Alexander himself interpreted Aristotle's 'active intellect' not as an immortal element in each individual, but as god, the unmoved mover, apprehended by our own intellects. Both on the question of soul and on that of the status of universals, Alexander gives a non-Platonizing reading of Aristotle, which accounts for some of the criticism to which he has been subjected by successors both ancient and modern. His treatment of the problem of free will has also been influential, though his criticisms of determinism are more telling than his own positive solution.

Seeing his task as interpreting Aristotle's writings with the aid of one another and explaining apparent inconsistencies, Alexander contributed to the growth of Aristotelianism as a system; he does not criticize nor challenge Aristotle, and regards his own innovations as Aristotelian doctrine, developed in the context of new questions which Aristotle himself had not confronted in the same form. He was better at seeing the details than at comprehending the global picture, and the potential of some of his doctrinal contributions is most apparent in what they suggested to others; but there is still much to interest philosophers in his detailed argumentation on particular points and passages.

1 Life, works and relation to Aristotle

Alexander's treatise *On Fate* is dedicated - with some elaborate rhetorical flourishes, and a request to consult him if further clarification is needed - to the emperors Septimius Severus and Caracalla, in gratitude for his appointment as a publicly recognized teacher of Aristotelian philosophy. Since Caracalla was made Augustus as Septimius Severus' colleague in AD 198, and Geta joined them as a third Augustus in AD 209, the date is fixed as between these two points; but we do not know at what stage in Alexander's career the appointment was made. Nor do we know for certain where the post in question was, though it is likely enough that it was the chair at Athens established by Marcus Aurelius (§1) in 176; Alexander's use of Aristotle's statue in Athens as an example in *On Aristotle's Metaphysics* (415.29-31) has been seen as supporting this.

Some of the general characteristics of Alexander's writings have been indicated above. His surviving commentaries are those on *Metaphysics* I-V (that on the remainder of the *Metaphysics*, like that on the *Sophistical Refutations*, is not by Alexander but by the twelfth-century Michael of Ephesus), *Prior Analytics* I, the *Topics*, the *Meteorology* and *On Sensation*. They are characterized by the frequent inclusion of alternative explanations, and by an absence of the formal organization, reflecting the programme of teaching in a school context, that is found in the later Neoplatonic commentaries on Aristotle. Alexander also wrote commentaries, now known only from later quotations, on the other logical and physical works of Aristotle. Whether he produced a full-scale commentary on the *Ethics* is debated, and he shows little or no interest in the zoological, political and rhetorical works.

Alexander's monographs include, surviving in Greek, *On the Soul* (as distinct from his commentary, now lost, on Aristotle's *On the Soul*), *On Fate*, *On Mixture*, and, surviving only in Arabic translation, *On the Principles of the Universe* (the authenticity of which has been questioned), *On Providence*, a work on differentiae, and *Refutation of Galen's Attack on Aristotle's Doctrine That Everything That Moves is Set In Motion by a Mover* (the actual connection of this treatise with Galen's views, like much else in the Arabic tradition concerning the relations between Alexander and Galen, is doubtful). There were other monographs, now lost (see below). In addition, the

extant collections of short discussions include, in Greek, the so-called second book of Alexander's *On the Soul*, better known by the name *Mantissa* or 'makeweight' given it by its modern editor, Ivo Bruns; three books of *Quaestiones (School-Puzzles and Solutions Concerning Nature)*; and one book of *Ethical Problems*. (Another collection, of *Medical Puzzles and Physical Problems*, has nothing to do with Alexander.) These collections were put together, often ineptly, by editors later than Alexander himself. Other similar material has been preserved in compendia in Greek manuscripts or in Arabic translation. Study of the relative dating of Alexander's works, and on the relation between the commentaries and the short discussions, is still in its infancy.

Both the relationships among Alexander's works and his loyalty to Aristotle can be illustrated by two particular topics. Both in the *Prior Analytics* commentary and in a separate monograph, now lost (see Alexander, *On Aristotle's Prior Analytics* 125.30- 1; Philoponus, *On Aristotle's Prior Analytics* 126.20), Alexander discussed Aristotle's modal logic; Alexander's writings are a major source for the controversy between Aristotle himself and his immediate followers, Theophrastus (§2) and Eudemus, over the conversion of contingent premises and the modality of the conclusions of syllogisms with 'mixed' premises (for example, one necessary and one assertoric). However, while many would hold that there is more logical elegance in Theophrastus' and Eudemus' view that the conclusion is in every case only as strong as the weakest premise (the medieval rule *peiorem semper conclusio sequitur partem*) Alexander remains loyal to Aristotle (*On Aristotle's Prior Analytics* 125.3-127.16). Second, Alexander answers Aristotle's problem in *Physics* VIII 4 254b33-, 'What is it that causes the natural movement of a falling heavy body?', by an analogy between the soul, as the form of a living creature and cause of its movement, and heaviness, as the form of a heavy body and the internal cause of *its* movement. This analogy - and it is presented only as an analogy - is put forward not only in the *Refutation of Galen on Motion*, but also in *On the Soul* (22.7-) and *On the Principles of the Universe*; and it has been seen by Pines (1961) as a possible ancestor of Philoponus' explanation of the motion of a projectile forced - in Aristotelian terms, rather than natural - by an internal impetus imparted to it by the thrower (see Philoponus §2). Alexander, as quoted by Simplicius, *On Aristotle's Physics* 1346.37-, remains loyal to Aristotle's implausible explanation of the continued motion of a projectile by movement imparted to the air behind the projectile as well as to it.

2 Soul and intellect

Aristotle defines soul as the first actuality of a natural body potentially possessing life, or, more shortly, of an organic body, and regards the soul of a living creature as its form (see Aristotle §17; Psychē). But it is controversial how this is to be understood. Some have interpreted Aristotle's notion of soul as a functionalist one; but this view has been criticized on the grounds that it does not do justice to the close connection in Aristotle between the performance of a given function and the particular arrangement needed for it. This close connection between form and matter in Aristotle's theory of them has caused major difficulties for interpreters, because it is not clear how soul and body can be logically distinguished, if a lifeless hand or eye is a hand or eye only in name, and only an already living, 'ensouled' body is to count as an organic body. It seems that either body must be defined in terms of soul, which raises the question whether there is any level at which the matter of a living body is specifiable without reference to its soul, or else that soul must be accounted for in terms of the arrangement of the body and its parts.

Interpreters of Aristotle have favoured the former approach. Aristotle himself (in *On the Soul* I 4) rejects - though with some hesitation - the notion that soul can be a 'harmony' or arrangement of the bodily elements, partly because such an arrangement cannot itself be a cause of movement as the soul is. However, Alexander not only defines the soul as the product of the mixture of the bodily elements (*On the Soul* 24.21-3), apparently following Andronicus, but sets out his exposition of the nature of soul by starting with the simple bodies, earth, air, fire and water, and working upwards through progressively more elaborate compounds until he arrives at living creatures and finally at human beings. It is therefore hardly surprising that his account of the soul has often been criticized as materialist, reductivist and un-Aristotelian. However, these criticisms may to some extent reflect the critics' own standpoints, and their own interpretations of Aristotle. It is scarcely un-Aristotelian to suggest that a given form requires a given arrangement of given types of matter, and Alexander's order of exposition need not indicate that he regards more complex forms as posterior to less complex ones so far as explanatory or ontological dependence is concerned. Indeed he derives the substantiality of the form-matter composite from that of the form and the matter (6.2-4), and insists that it is the form of each thing that determines its nature (7.4-8). Moreover, texts attributed to Alexander insist that form is not in matter, or soul in body, in the way that a quality can be in a

substrate, because it is by the form and the soul that the matter and the body are characterized in the first place (*Quaestiones* I 8, 17, 26; *Mantissa* 119-22.)

It is true that Alexander's treatment of soul excludes any individual immortality; indeed this was his chief source of popularity in the Renaissance (see §5). But Aristotle's view itself arguably encounters difficulties where personal immortality is concerned. Attribution to Aristotle, in his mature period, of belief in personal immortality turns on interpretation of his remarks concerning intellect, and especially the so-called 'active intellect' of his own *On the Soul* III.5 (see Aristotle §19; Nous). Alexander, however, identifies the active intellect not with an element peculiar to the soul of each individual but with god, the 'unmoved mover' of *Metaphysics* XII. The theory of intellect is discussed both in Alexander's *On the Soul* and in a section of the *Mantissa* which is of doubtful authenticity and seems itself to be a combination of several different texts, but which circulated independently in the Middle Ages first in Arabic translation and then in Latin, and was more influential than Alexander's *On the Soul* itself. Common to both works is the view that the individual human's intellect at birth is purely potential; it is therefore referred to as 'material intellect', by analogy with the potentiality of matter in the ordinary sense of the latter term. Since, however, it must be receptive to all forms, it has no nature of its own (see Aristotle, *On the Soul* III 4, 429b10-22); and indeed in *On the Soul* its state at birth is likened not so much to a blank writing-tablet (Aristotle, *On the Soul* III 4, 429a31-) as to the blankness of the tablet (84.24-7). As a person grows to adulthood the 'material' intellect develops, by the acquisition of concepts through the abstraction of matter from the forms in substances composed of form and matter, until it becomes intellect 'in disposition' (*en hexei*, later Latinized as *in habitu*), capable of independent thought.

What is less clear is the part which the active intellect is supposed to play in this process. Alexander's *On the Soul*, characteristically, simply presents two arguments *that* the unmoved mover, as pure self-thinking intellect and intelligible in its own right, is responsible for our thinking too, without explaining very adequately *how* this comes about. First, as supremely intelligible it must be the cause of other things' intelligibility (88.24-89.8) - an argument which sounds more Platonist than Aristotelian, though it is not indeed being used here to *establish* the existence of intelligible pure form. And second, it is the cause of being for all other things, and thus for all the objects of intellect (89.9-19). This is probably to be understood in terms of the movement of the heavens, caused by the unmoved mover, being the cause of sublunary coming-to-be (see §4); but as an explanation of how our intellects become able to think it scarcely seems adequate. In the short text *On Intellect* (107.31-4, 108.19-22), on the other hand, the active intellect appears to act directly upon our intellect, apparently by providing it with a paradigm of pure form and thus enabling it to separate other, 'enmattered' forms from the matter in which they are embodied - which apparently has the rather implausible implication that we must apprehend god, in order to possess this paradigm, before we can think of anything else in general terms. In *On the Soul* 90.11- 20 it is argued that, since intellect is identical with its object at any given time, immortality can be present in us when we think of god; but it is not our own 'material' intellect that then becomes immortal. This is the only immortality open to us as individuals (but see below on the eternity of species).

On Intellect (whether itself by Alexander or not) indicates that Alexander's treatment of the topic built upon earlier Peripatetic discussions, and that the identification of the active intellect with god rather than with an element in the individual soul had already been connected with Aristotle's reference to 'intellect from outside' (*Generation of Animals* II 3 736b27-). But that in fact relates to the origin of intellect in the context of the generation of individual human beings, with no explicit identification of the source from which such intellect comes, and no apparent reference to its entering into us through acts of intellectual apprehension, as in Alexander's view.

3 Universals

Aristotle rejects the Platonist view that forms of material objects can exist even in the absence of any material instances, and holds that the form of human being exists only in individual human beings and, in a different way, in the minds that think of them. What is much less clear is Aristotle's view of the ontological status of such forms, and in particular whether they are to be regarded as individual or universal. Alexander regards universals as posterior to individuals. He has therefore been criticized for adopting an un-Aristotelian nominalism; but his position is in fact more subtle. If we accept the evidence of the *Quaestiones* (I 3), Alexander draws a distinction between the nature, as such, of a species, and that nature as a universal. Definition is of what is common to the members of a species, as opposed to the individual accidents due to matter (*On the Soul* 85.15-18, where

Alexander seems to adopt a doctrine of numerically distinct forms in different members of the same species; see Aristotle). But the definition of the nature of the species would still be the same even if only one member of the species existed. Definition is thus of what is common, but not of what is common as common, and it is purely accidental to a specific nature whether it is universal, in the sense of having more than one instantiation, or not. However, while the individual is prior to the universal in the sense that an individual can exist without there being a universal, the universal is none the less, in cases where there is more than one instance, prior to any particular individual; the existence of 'human being' does not depend on the existence of Socrates or of any other particular named individual (*On Providence*, Ruland 1976: 89; compare Alexander reported by Dexippus, *On Aristotle's Categories* 45.16 and by Simplicius, *On Aristotle's Physics* 19.5-11). Similarly, the genus is prior to the species (*Quaestiones* I 11-). There can be animals without there being horses, but not horses without there being animals; on the other hand, this horse would still be an animal even if there were no other animals and no other horses at all.

Alexander does say (*On the Soul* 90.2-11) that forms embodied in matter depend for their existence on being intelligized, and that (*Quaestiones* II 28 78.18-20) genus *as genus* - that is, as including several different species - is just a name, its existence depending on its being thought of. But it is not clear that this involves nominalism, if by nominalism is meant the view that common natures are *arbitrary* thought-constructs or that their reality derives purely from our giving a common name to a particular collection of individuals (see Nominalism). The point of the statement at *On the Soul* 90.2-11 is to contrast them with pure intelligible forms (the unmoved movers), and, given the part played by specific natures in Alexander's theory of providence (see §4), it seems that, far from being nominalist, Alexander's theory of species is essentialist, involving a rigid distinction between the nature common to the species and individual accidents.

4 Providence and fate

On both providence and fate Alexander adapts Aristotelian materials to the discussion of new issues, presenting the resulting account as 'Aristotelian'. In the case of providence, discussed in the treatise *On Providence* and in several of the *Quaestiones*, especially the unfinished dialogue II 21, he is concerned to mediate between, on the one hand, interpretations of Aristotle (especially but not only by the hostile Platonist Atticus) as making divine influence on the sublunary world purely accidental and so not providence at all, and, on the other hand, the pantheistic doctrine of the Stoics (see Stoicism §5), which he regards as unworthy of the divine dignity by involving god directly in every detail of the world, however humble, and also as incompatible with the perceived existence of evils. His solution makes use of the Aristotelian theory (*Generation and Corruption* II 10) that the motion of the heavens and especially of the sun on the ecliptic, caused by desire for the unmoved mover, is responsible for the cycle of the seasons and thus for the continuity of coming-to-be and passing-away and the perpetuation of natural kinds. Alexander interprets this as providence, but a providence concerned with the eternity of species rather than with the fortunes of individuals. The charge that providence involves the divine existing for the sake of what is inferior to it was apparently answered by the argument (*Quaestiones* I 23 36.22-3; compare with I 25 41.1-2; *On the Principles of the Universe*, Badawi 1968: 127-8) that the continuation of the sublunary world benefits the heavens by giving them a centre around which to revolve; and Alexander apparently accepted that non-accidental providence must involve some awareness of its objects on the part of what exercises it, the divine presumably being aware of sublunary beings as species but not as individuals. Some of the details remain obscure, especially as concerns the identity of the being or beings exercising providence and the relation here between the divine heavenly spheres on the one hand and the unmoved mover(s) on the other; moreover, Alexander's theory of providence amounts to little more than an upholding of the general ordering of the world, as opposed to the concern with its complex history, and especially with the fortunes of individual human beings, characteristic of both the Stoic and the Judaeo-Christian traditions. At the end of the twelfth century Alexander's treatise *On Providence* was used as a source for ancient Greek theories - and its denial of divine concern for individuals rejected - by Moses Maimonides (*Guide to the Perplexed* III 16-17).

The notion of a general ordering of the universe which is unaffected by variations in detail also appears in Alexander's treatise *On Fate* (ch. 25), where it is used to counter the argument (Stoic, though the determinists attacked in the treatise are never actually named there as Stoics) that a nexus of causes and effects admitting of no exceptions is essential if the unity of the universe is to be preserved (see Stoicism §20). Unfortunately - and characteristically - Alexander in this treatise is more concerned to attack the determinist account of human agency,

as conflicting with common experience and detrimental to morality, than to explain how in his own view human agency fits into the world as a whole; this problem is more pressing for him than for Aristotle, because he is concerned to reject determinism while also claiming to avoid the introduction of any 'uncaused motion'. There is a similarity between Alexander's philosophical position here and the way in which Carneades had sought to escape determinism while rejecting the Epicureans' uncaused atomic 'swerve' (see Epicureanism §§4, 12; Carneades §3; and further below), though the question of possible historical influence of Carneades on Alexander is undecided, and Alexander makes no explicit reference to the atomic swerve or to the problems it involves. An attempt to locate human agency in the context of a general worldview is made by one of the short texts attributed to Alexander (*Mantissa*, Bruns 1887-92: 169-172), which thus reveals the limitations of Alexander's own treatment. However, by linking responsible choice to uncaused motion, contrary to Alexander's own view, it succeeds only in demonstrating the difficulties of a radical indeterminism.

In the absence of any single and systematic account of exceptions to determinism in *On Fate*, we are left with a series of separate claims:

(1) Alexander begins by setting out (chaps 3-6) an anti-determinist doctrine of fate - perhaps taken over, indeed, from earlier Peripatetic sources, basing it on the Aristotelian doctrine of nature as what applies for the most part but not always. Our actions are for the most part in accordance with our individual character, but not inevitably so.
(2) The occurrence of chance events disproves determinism (ch. 8; compare ch. 24). The stock Aristotelian examples of coincidences (finding buried treasure, and the like) which Alexander uses can, however, be accommodated within the Stoic system; true, if everything that happens is part of a single providential plan they will not really be coincidences, but Alexander's claim that they are rests, like much of his anti-Stoic argumentation in *On Fate*, on appeals to a common opinion which turns out to be Aristotelian school doctrine.
(3) Alexander argues (ch. 15) that our action can be free from being predetermined, and yet not be uncaused, because we ourselves, as agents, are the cause, this indeed being what it means to be human. This argument resembles, in general character though not in the details of its expression, that of Carneades on the same issue (Cicero, *On Fate* 25) which Richard Taylor has seen as anticipating modern agent causation theory. It is not, however, clear that introducing non-physical causes can provide a way out of the dilemma that either everything that occurs is predetermined on the physical level, or else there must be some break in the continuity of such physical causation.
(4) Following Aristotle (*Nicomachean Ethics* III 5), Alexander argues (chaps 27-9) that even if an agent cannot act contrary to a developed character, the development of that character is itself the agent's responsibility. This argument is unsatisfactory in itself - as Alexander apparently realizes; see (5) - simply pushing the problem back into the past; it also involves a view of the relation between natural endowment, developed character and action which is at least on the face of it different from that in (1). (Other texts attributed to Alexander take up this point, reconciling the two approaches by arguing that, while innate proclivities vary, everyone who is not morally deformed has the capacity to become virtuous: *Mantissa* 175.25-32; *Ethical Problems* 161.15-29.)
(5) To meet the difficulty of reconciling responsible choice, understood as requiring that the agent be able (and 'able' not just in a counterfactual sense) either to perform or not to perform the act in question, with the argument that for any given agent with a given perspective on a given situation only one course of action will be reasonable, Alexander makes three points. First, our actions are aimed not towards one goal but towards three: the noble, the advantageous and the pleasant (ch.15). The identification of these three ends is Aristotelian (*Nicomachean Ethics* II 3, 1104b30-), but not their treatment as equally valid alternatives for a single individual, and in the context of Alexander's argument it raises the question of what account we are to give of an agent's choice between them. Second, there is a certain degree of latitude, more than one possible action expressing a given character-trait or goal (ch. 29). This seems not to capture morally significant choices. Third, we may sometimes act otherwise than we normally would in a given situation, just to prove that we have the capacity to do so, and especially to confound a prophet (ch. 29). (A modern version might put it in terms of confounding a psychologist.) But this is entirely compatible with determinism, the abnormal action itself being a theoretically predictable reaction to an unusual situation.

Although Alexander fails to clarify his position, to such an extent that D. Frede has classified his position as compatibilist rather than libertarian (see Free will §1), the detailed arguments of the treatise *On Fate* anticipate many of the moves made in the free-will debate subsequently, and show considerable ingenuity. Alexander's

strongest anti-determinist argument rests on the inability of determinism to make sense of our experiences of choice and deliberation; and, in an argument analogous to Pascal's wager (see Pascal §6), he claims (ch. 21) that there is less danger in believing our actions are not predetermined when in fact they are, than in believing that they are when in fact they are not.

5 Influence

Alexander's commentaries were read in the school of Plotinus, the founder of Neoplatonism (Porphyry, *Life of Plotinus* 14). Studies of Alexander's influence on Plotinus have tended to find numerous correspondences in points of detail rather than conclusive evidence of influence on the major features of Plotinus' system. Plotinus used Alexander essentially as a guide to understanding Aristotle; the way in which Plotinus formulates the Aristotelian principle of the identity of intellect and its object shows Alexander's influence, but the doctrine itself had been adopted by Platonism earlier. Some have seen a connection between Alexander's discussion of a plurality of pure forms without matter (the plurality of unmoved movers) and Plotinus' doctrine of the unity of 'forms in intellect'; but Plotinian, and Platonic, forms are related to sensible objects in a different way from the Aristotelian unmoved movers, and in any case Alexander refers to pure forms sometimes in the singular and sometimes in the plural without seeming to attach much significance to the difference between the two. If Alexander's remarks did influence the Plotinian theory, they probably did so because of Plotinus' reflecting upon them rather than because of any awareness by Alexander of their possible significance. Similarly, too, with the suggestion that for Alexander our intellect, by apprehending the divine intellect, also apprehends its eternal objects; such a theory can be seen as a logical extension of Alexander's views, but it goes beyond anything that he actually says.

This point can be generalized. The limitations of Alexander's discussion of the active intellect have already been mentioned; his relatively terse reference to our achieving temporary immortality through contemplation of god is probably to be interpreted in terms not so much of mystical experience as of a desire to develop the logical implications of his account. Nevertheless, Alexander's doctrine of a single suprapersonal active intellect was immensely influential; it was later adopted by Averroes, though he - influenced by Neoplatonism - regarded the 'passive' or potential intellect too as one for all human beings. Aquinas was therefore able to cite Alexander for the individuality of the passive intellect in his controversy with the Averroists (see Aquinas §7; Averroism §1, 2), even though differing from him concerning the active intellect and the immortality of the individual. In the sixteenth century Alexander's view, rejecting personal immortality, was advocated notably by Petro Pomponazzi, in successful defiance of the decree of the Lateran Council in 1513 that 'individual immortality could be demonstrated philosophically and consequently had to be defended by all philosophers' (Kessler 1988: 495, 507), and by Jacopo Zabarella.

Alexander of Hales (*c*.1185-1245)

Alexander's emphasis on speculative theology initiated the golden age of scholasticism. His philosophy was influenced by that of Aristotle, particularly in the field of ethics, and also by Augustine, Boethius and Peter Lombard. He believed that philosophy, based on natural reason, and theology, based on divine revelation, were two different disciplines and that philosophy ought to be independent of theology. He himself was primarily a theologian, and the colossal Summa Halesiana, most of which was compiled under his direction, constitutes the first complete theological synthesis in the West.

1 Life and influences

Alexander of Hales, called *doctor irrefragabilis* (the invincible doctor), was born in the village of Hales in the county of Shropshire (possibly the present Halesowen, now in neighbouring Worcestershire) *circa* 1180-85. The son of a rich rural family, he studied at the University of Paris, where he became regent master first in the faculty of Arts and later in the faculty of Theology. In 1230, he represented the University as procurator at the Papal Curia. In 1231, he returned for a short while to England, where he was made canon of Lichfield and soon after archdeacon of Coventry. In 1235, he was one of King Henry III's deputies, charged with renewing the peace treaty between England and France.

During this period, however, he retained his chair at the University of Paris. In 1236, he renounced honours and riches and entered the Order of St Francis, but he remained a master of theology and continued teaching as regent master in the Franciscan friary in Paris, which was an integral part of the University. Alexander was the first Franciscan Master of Theology and the first to teach theology by lecturing on the *Sentences* of Peter Lombard. His most prominent disciples include Bonaventure, Richard Rufus of Cornwall and John of La Rochelle, to whom he resigned his chair in theology near the end of his life. Alexander died in Paris on 21 August 1245.

As a master of arts, Alexander was familiar with the logical works of Aristotle, and with Books II and III of the *Nicomachean Ethics*, the so-called *ethica vetus*. He accepted Aristotle's definition of virtue and some of his views on the passions. Again following Aristotle, Alexander distinguished voluntary acts, involuntary acts and acts resulting from ignorance, and held that certain acts are indubitably evil.

By contrast, Alexander's knowledge of the *Metaphysics*, *Physics* and *On the Soul* was scant and superficial. At the time he was studying and teaching in the faculty of Arts, the so-called *libri naturales* were not available in Latin translation, and when they became available their reading and teaching were forbidden in Paris for several years. Philosophically, Alexander is more closely related to Augustine and Boethius than to Aristotle. He took from Augustine the distinction between natural, rational and moral philosophy, and from Boethius the distinction between nature and person and the view that all creatures are composed of essence (*quod est*) and existence (*quo est*). Most of the philosophical speculations in the *Summa Halesiana* must be attributed to Alexander's younger collaborators, John of La Rochelle, William of Militona and Odo Rigaldi, who had more thorough training in the philosophy of Aristotle.

2 Works

Alexander was, above all, a theologian. Though he believed that all philosophy begins with the principle of non-contradiction, he maintained that we must humble our minds in obedience to Christ and accept what appear to be contradictory statements if that is what faith requires (*Glossa* III d.24 FBS 14: 295). However, Alexander also supported the disciplinary separation of philosophy and theology which was to allow the independence of philosophy. He held that since philosophy is based on natural reason and theology on divine revelation, the two disciplines follow different paths and arrive at different levels of certitude.

Before 1945, none of Alexander's certainly authentic works were known. His fame and reputation rested entirely on the very extensive *Summa theologica* or *Summa Halesiana*, originally called the *Summa Fratris Alexandri*. However, the authenticity of this great work was a matter of debate among medievalists. This is partly because the Franciscan Roger Bacon, Alexander's contemporary, suggested that others wrote the *Summa* and attributed it to Alexander out of reverence. Also, different parts seem to be by different redactors; they are not always consistent. Finally, the Summa borrows from the writings of contemporary or earlier authors. Nevertheless, it is now an

established fact that the first three books (with the exception of some later additions) were composed before Alexander's death in 1245, very likely under his supervision, and the principal sources used were Alexander's own earlier writings. Therefore, even though the work is not, strictly speaking, a *Summa Fratris Alexandri*, it is correct to call it *Summa Halesiana*. The fourth book was finished after Alexander's death by William of Militona, who incorporated into it his own extensive and influential questions on the sacraments.

Later in his career as a master of theology, Alexander held many disputations on a variety of theological problems. The 68 questions he disputed before he became a Franciscan friar in 1236 have been edited; a further 78 questions, disputed later, still await editing.

Alexander's earliest known work, his commentary (*Glossa*) on books of the *Sentences* of Peter Lombard, was composed between 1223 and 1227. In the first book of the *Glossa*, there is a remarkable analysis of the mystery of the Trinity with subtle distinctions between properties, relations and notions (see Trinity). In Book II, Alexander teaches how we can see the vestiges of the Creator in the created universe and the image of the Trinity in the rational soul, which is one simple substance endowed with intellect, will, and memory (Fornaro 1985) (see Soul, nature and immortality of). In Book III, the doctrine of the hypostatic union is impressive for both its range of interest and its originality. It surpasses earlier authors in the variety of topics it treats, the sophistication of its theological method and the profundity of its thought (Principe 1967). In the fourth book, on the seven sacraments of the Church, he reveals himself an accomplished canonist, quoting Gratian and the *Decretals* of Gregory IX hundreds of times.

According to Roger Bacon, Alexander was the first to introduce the four books of the *Sentences* of Peter Lombard as a textbook for the faculty of theology. It was Alexander who divided the books into 'distinctions', according to the principal problems treated. As divided by Alexander, the *Sentences* remained the basis of theological instruction for three centuries; hundreds of commentaries were written on it. Alexander of Hales fully deserves his reputation as one of the greatest theologians of the thirteenth century.

Alexander, Samuel (1859-1938)

Alexander propounded a metaphysical system based on a view of Space-Time differentiated into 'motions' from which new qualities emerged at certain levels of organization; matter, life and mind being those qualities so far realized. Space-Time is a process with a 'nisus' (that is, an internal drive) towards a quality, as yet unrealized, called 'Deity'.

1 Space, time and deity

Alexander was born in Sydney, Australia, came to Balliol College, Oxford, and was subsequently Fellow of Lincoln College, Oxford, and Professor of Philosophy at the University of Manchester. His metaphysics rested on the concept of a Space-Time continuum ordered in four-dimensional perspectives from 'point-instants', which are not extended events, but limiting cases of 'motions', his term for the actual differentiations within Space-Time. These motions form patterns, the most general of which, notably causation, are all-pervasive categories. As a direct realist, he claimed that these categories were discerned, not imposed, by conceptual schemes. More specific motions in Space-Time displayed patterns in which distinctive qualities emerged at certain levels of organization. 'Matter', with its inertial properties, is the lowest level; certain of its complexes display the new quality 'life', and some of these display a further quality 'mind'. This view is a form of evolutionary naturalism, but not materialism, since 'matter' is the name for certain qualities from which further qualities of life and mind emerge, and these latter are not reducible to the former. Moreover, the basic reality is not matter but Space-Time.

Space-Time is not a closed system within which there can be redistributions of spatiotemporal coefficients. Its temporal aspect makes it an ongoing process in which there is a 'nisus' towards the production of new qualities. Beyond those known to us, there may be one, as yet unrealized, called 'Deity'. 'Deity' is not God as existent, but a quality towards which we can aspire.

2 Knowledge and values

The time dimension of Space-Time gives things an internal aspect as going through a process, while the space dimension sets them in an external relation called 'compresence'. A subject's inner experience of knowing is called 'enjoyment' and its relation of compresence to an object is called 'contemplation'. This is a direct realism, which raises difficulties over questions of error and counterfactual conditions. This realism extends to secondary qualities, such as colours. Besides secondary qualities there are 'tertiary' qualities called values, which arise in situations where one compresent factor is a mind. Chief of these are Truth, Beauty and Goodness. Here Alexander's main interest, expressed in a number of discussions of pieces of prose, poetry, art and architecture, was aesthetics. He held that there is a constructive impulse to manipulate materials which can be disengaged from practical ends and become contemplative, so leading to aesthetic appreciation. In stressing the need for a material medium as the carrier of the value of Beauty,Alexander's aesthetics are of a piece with his view of neurophysiological processes as bearers of non-reducible mental qualities shown in the capacity for conscious enjoyment and contemplation.

al-Farabi, Abu Nasr (*c*.870-950)

Al-Farabi was known to the Arabs as the 'Second Master' (after Aristotle), and with good reason. It is unfortunate that his name has been overshadowed by those of later philosophers such as Ibn Sina, for al-Farabi was one of the world's great philosophers and much more original than many of his Islamic successors. A philosopher, logician and musician, he was also a major political scientist.

Al-Farabi has left us no autobiography and consequently, relatively little is known for certain about his life. His philosophical legacy, however, is large. In the arena of metaphysics he has been designated the 'Father of Islamic Neoplatonism', and while he was also saturated with Aristotelianism and certainly deploys the vocabulary of Aristotle, it is this Neoplatonic dimension which dominates much of his corpus. This is apparent in his most famous work, al-Madina al-fadila (The Virtuous City) which, far from being a copy or a clone of Plato's Republic, is imbued with the Neoplatonic concept of God. Of course, al-Madina al-fadila has undeniable Platonic elements but its theology, as opposed to its politics, places it outside the mainstream of pure Platonism.

In his admittedly complex theories of epistemology, al-Farabi has both an Aristotelian and Neoplatonic dimension, neither of which is totally integrated with the other. His influence was wide and extended not only to major Islamic philosophers such as Ibn Sina who came after him, and to lesser mortals such as Yahya ibn 'Adi, al-Sijistani, al-'Amiri and al-Tawhidi, but also to major thinkers of Christian medieval Europe including Thomas Aquinas.

1 Life and works

Abu Nasr Muhammad ibn Muhammad ibn Tarkhan ibn Awzalagh al-Farabi was born in approximately AH 257/AD 870. He may rightly be acclaimed as one of the greatest of Islamic philosophers of all time. While his name tends to be overshadowed by that of Ibn Sina, it is worth bearing in mind that the latter was less original than the former. Indeed, a well-known story tells how Ibn Sina sought in vain to understand Aristotle's *Metaphysics*, and it was only through a book by al-Farabi on the intentions of the *Metaphysics* that understanding finally came to him. However, unlike Ibn Sina, al-Farabi has left us no autobiography and we know far less about his life in consequence. Considerable myth has become attached to the man: it is unlikely, for example, that he really spoke more than seventy languages, and we may also query his alleged ascetic lifestyle. We do know that he was born in Turkestan and later studied Arabic in Baghdad; it has been claimed that most of his books were written here. He travelled to Damascus, Egypt, Harran and Aleppo, and in the latter city the Hamdanid ruler Sayf al-Dawla became his patron. Even the circumstances of his death are not clear: some accounts portray him dying naturally in Damascus while at least one holds that he was mugged and killed on the road from Damascus to Ascalon.

Al-Farabi became an expert in philosophy and logic, and also in music: one of his works is entitled *Kitab al-musiqa al-kabir (The Great Book of Music)*. However, perhaps the book for which he is best known is that whose title is abbreviated to *al-Madina al-fadila (The Virtuous City)*, and which is often compared, misleadingly in view of its Neoplatonic orientation, to Plato's *Republic*. Other major titles from al-Farabi's voluminous corpus included the *Risala fi'l-'aql (Epistle on the Intellect)*, *Kitab al-huruf (The Book of Letters)* and *Kitab ihsa' al-'ulum (The Book of the Enumeration of the Sciences)*.

2 Metaphysics

Majid Fakhry (1983) has described al-Farabi as 'the founder of Arab Neo-Platonism and the first major figure in the history of that philosophical movement since Proclus'. This should be borne in mind as we survey the metaphysics of the philosopher whom the Latin Middle Ages knew as Abunaser and whom the Arabs designated the 'Second Master' (after Aristotle). It should be noted that al-Farabi was an Aristotelian as well as a Neoplatonist: he is said, for example, to have read *On the Soul* two hundred times and even the *Physics* forty times. It should then come as no surprise that he deploys Aristotelian terminology, and indeed there are areas of his writings that are quite untouched by Neoplatonism. Furthermore, al-Farabi tried to demonstrate the basic agreement between Aristotle and Plato on such matters as the creation of the world, the survival of the soul and reward and punishment in the afterlife. In al-Farabi's conception of God, essence and existence fuse absolutely with no possible separation between the two. However, there is no getting away from the fact that it is the Neoplatonic element which dominates so much else of al-Farabi's work. We see this, for example, in the powerful

picture of the transcendent God of Neoplatonism which dominates *al-Madina al-fadila*. We see this too in al-Farabi's references to God in a negative mode, describing the deity by what he is not: he has no partner, he is indivisible and indefinable. And perhaps we see the Neoplatonic element most of all in the doctrine of emanation as it is deployed in al-Farabi's hierarchy of being.

At the top of this hierarchy is the Divine Being whom al-Farabi characterizes as 'the First'. From this emanates a second being which is the First Intellect. (This is termed, logically, 'the Second', that is, the Second Being). Like God, this being is an immaterial substance. A total of ten intellects emanate from the First Being. The First Intellect comprehends God and, in consequence of that comprehension, produces a third being, which is the Second Intellect. The First Intellect also comprehends its own essence, and the result of this comprehension is the production of the body and soul of *al-sama' al-ula*, the First Heaven. Each of the following emanated intellects are associated with the generation of similar astral phenomena, including the fixed stars, Saturn, Jupiter, Mars, the Sun, Venus, Mercury and the Moon. Of particular significance in the emanationist hierarchy is the Tenth Intellect: it is this intellect which constitutes the real bridge between the heavenly and terrestrial worlds. This Tenth Intellect (variously called by the philosophers the active or agent intellect in English, the *nous poiétikos* in Greek, the *dator formarum* in Latin and the *'aql al-fa''al* in Arabic) was responsible both for actualizing the potentiality for thought in man's intellect and emanating form to man and the sublunary world. With regard to the latter activity, it has been pointed out that here the active intellect takes on the role of Plotinus' Universal Soul (see Plotinus).

In Farabian metaphysics, then, the concept of Neoplatonic emanation replaces that of Qur'anic creation *ex nihilo* (see Neoplatonism in Islamic philosophy §2). Furthermore, the Deity at the top of the Neoplatonic hierarchy is portrayed in a very remote fashion. Al-Farabi's philosophers' God does not act directly on the sublunary world: much is delegated to the Active Intellect. However, God for al-Farabi certainly has an indirect 'responsibility' for everything, in that all things emanate from him. Yet we must also note, in order to present a fully rounded picture, that while it is the Neoplatonic portrait of God which dominates al-Farabi's writings, this is not the only picture. In some of his writings the philosopher *does* address God traditionally, Qur'anically and Islamically: he *does* invoke God as 'Lord of the Worlds' and 'God of the Easts and the Wests', and he asks God to robe him in splendid clothes, wisdom and humility and deliver him from misfortune. Yet the overwhelming Neoplatonic substratum of so much else of what he writes fully justifies Fakhry's characterization of al-Farabi, cited earlier, as 'the founder of Arab Neo-Platonism'.

3 Epistemology

Farabian epistemology has both a Neoplatonic and an Aristotelian dimension. Much of the former has already been surveyed in our examination of al-Farabi's metaphysics, and thus our attention turns now to the Aristotelian dimension. Our three primary Arabic sources for this are al-Farabi's *Kitab ihsa' al-'ulum*, *Risala fi'l-'aql* and *Kitab al-huruf*.

It is the second of these works, *Risala fi'l-'aql*, which provides perhaps the most useful key to al-Farabi's complex theories of intellection. In this work he divides *'aql* (intellect or reason) into six major categories in an attempt to elaborate the various meanings of the Arabic word *'aql*. First, there is what might be termed discernment or prudence; the individual who acts for the good is characterized by this faculty, and there is clearly some overlap with the fourth kind of intellect, described below. The second of al-Farabi's intellects is that which has been identified with common sense; this intellect has connotations of 'obviousness' and 'immediate recognition' associated with it. Al-Farabi's third intellect is natural perception. He traces its source to Aristotle's *Posterior Analytics*, and it is this intellect which allows us to be certain about fundamental truths. It is not a skill derived from the study of logic, but it may well be inborn. The fourth of the six intellects may be characterized as 'conscience': this is drawn by the philosopher from Book VI of Aristotle's *Nicomachean Ethics*. It is a quality whereby good might be distinguished from evil and results from considerable experience of life (see Aristotle §§18-21).

Al-Farabi's fifth intellect is both the most difficult and the most important. He gives most space to its description in his *Risala fi'l-'aql* and considers it to be of four different types: potential intellect, actual intellect, acquired intellect and agent or active intellect. *'Aql bi'l-quwwa* (potential intellect) is the intellect which, in Fakhry's words, has the capacity 'of abstracting the forms of existing entities with which it is ultimately identified' (Fakhry 1983: 121). Potential intellect can thus become *'aql bi'l-fi'l* (actual intellect). In its relationship to the actual intellect, the

third sub-species of intellect, *‘aql mustafad* (acquired intellect) is, to use Fakhry’s words again, the ‘the agent of actualization’ to the actualized object. Finally, there is the *‘aql al-fa‘‘al* (agent or active intellect), which was described in §2 above and need not be elaborated upon again.

The sixth and last of the major intellects is Divine Reason or God himself, the source of all intellectual energy and power. Even this brief presentation of Farabian intellection must appear complex; however, given the complexity of the subject itself, there is little option.

The best source for al-Farabi’s classification of knowledge is his *Kitab ihsa’ al-‘ulum*. This work illustrates neatly al-Farabi’s beliefs both about what can be known and the sheer range of that knowledge. Here he leaves aside the division into theological and philosophical sciences which other Islamic thinkers would use, and divides his material instead into five major chapters. Through all of them runs a primary Aristotelian stress on the importance of knowledge. Chapter 1 deals with the ‘science of language’, Chapter 2 formally covers the ‘science of logic’, Chapter 3 is devoted to the ‘mathematical sciences’, Chapter 4 surveys physics and metaphysics, and the final chapter encompasses ‘civil science’ (some prefer the term ‘political science’), jurisprudence and scholastic theology. A brief examination of these chapter headings shows that a total of eight main subjects are covered; not surprisingly, there are further subdivisions as well. To give just one example, the third chapter on the mathematical sciences embraces the seven subdivisions of arithmetic, geometry, optics, astronomy, music, weights and ‘mechanical artifices’; these subdivisions in turn have their own subdivisions. Thus al-Farabi’s epistemology, from what has been described both in this section and §2 above, may be said to be encyclopedic in range and complex in articulation, with that articulation using both a Neoplatonic and an Aristotelian voice.

4 Political philosophy

The best known Arabic source for al-Farabi’s political philosophy is *al-Madina al-fadila*. While this work undoubtedly embraces Platonic themes, it is in no way an Arabic clone of Plato’s *Republic*. This becomes very clear right at the beginning of al-Farabi’s work, with its description of the First Cause (Chapters 1-2) and the emanation of ‘the Second’ from ‘The First’ (Chapter 3). Later in the work, however, al-Farabi lays down in Platonic fashion the qualities necessary for the ruler: he should be predisposed to rule by virtue of an innate disposition and exhibit the right attitude for such rule. He will have perfected himself and be a good orator, and his soul will be, as it were, united to the active intellect (see §3). He will have a strong physique, a good understanding and memory, love learning and truth and be above the materialism of this world. Other qualities are enumerated by al-Farabi as well, and it is clear that here his ideal ruler is akin to Plato’s classical philosopher-king (see Plato §14).

Al-Farabi has a number of political divisions for his world. He identifies, for example, three types of society which are perfect and grades these according to size. His ideal virtuous city, which gives its name to the whole volume, is that which wholeheartedly embraces the pursuit of goodness and happiness and where the virtues will clearly abound. This virtuous city is compared in its function to the limbs of a perfectly healthy body. By stark contrast, al-Farabi identifies four different types of corrupt city: these are the ignorant city (*al-madina al-jahiliyya*), the dissolute city (*al-madina al-fasiqa*), the turncoat city (*al-madina al-mubaddala*) and the straying city (*al-madina al-dalla*). The souls of many of the inhabitants of such cities face ultimate extinction, while those who have been the cause of their fall face eternal torment. In itemizing four corrupt societies, al-Farabi was surely aware of Plato’s own fourfold division of imperfect societies in the Republic into timarchy, oligarchy, democracy and tyranny. The resemblance, however, is more one of structure (four divisions) rather than of content.

At the heart of al-Farabi’s political philosophy is the concept of happiness (*sa‘ada*). The virtuous society (*al-ijtima‘ al-fadil*) is defined as that in which people cooperate to gain happiness. The virtuous city (*al-madina al-fadila*) is one where there is cooperation in achieving happiness. The virtuous world (*al-ma‘mura al-fadila*) will only occur when all its constituent nations collaborate to achieve happiness. Walzer reminds us that both Plato and Aristotle held that supreme happiness was only to be gained by those who philosophized in the right manner. Al-Farabi followed the Greek paradigm and the highest rank of happiness was allocated to his ideal sovereign whose soul was ‘united as it were with the Active Intellect’. But Walzer goes on to stress that al-Farabi ‘does not confine his interest to the felicity of the first ruler: he is equally concerned with the felicity of all the five classes which make up the perfect state’ (Walzer, in introduction to *al-Madina al-fadila* (1985: 409-10)). Farabian political philosophy, then, sits astride the saddle of Greek *eudaimonia*, and a soteriological dimension may easily

be deduced from this emphasis on happiness. For if salvation in some form is reserved for the inhabitants of the virtuous city, and if the essence of that city is happiness, then it is no exaggeration to say that salvation is the reward of those who cooperate in the achievement of human happiness. *Eudaimonia*/*sa'ada* becomes a soteriological raft or steed.

5 Influence

The impact of al-Farabi's work on Ibn Sina was not limited merely to illuminating Aristotle's *Metaphysics*. It was with good reason that al-Farabi was designated the 'Second Master' (after Aristotle). One modern scholar recently acknowledged the dependence of Ibn Sina on al-Farabi in a book dealing with both which he entitled *The Two Farabis* (Farrukh 1944). And if Aquinas (§9) did not derive his essence-existence doctrine from al-Farabi but from the Latinized Ibn Sina, as is generally assumed, there is no doubt that Farabian concepts of essence and existence provided a base for the elaborated metaphysics of Ibn Sina and thence of Aquinas. Finally, the briefest of comparisons between the tenfold hierarchy of intellection produced by al-Farabi and the similar hierarchy espoused by Ibn Sina, each of which gives a key role to the Tenth Intellect, shows that in matters of emanation, hierarchy and Neoplatonic intellection, Ibn Sina owes a considerable intellectual debt to his predecessor.

Al-Farabi influenced many other thinkers as well. A glance at the period between AH 256/AD 870 and AH 414/AD 1023 and at four of the major thinkers who flourished in this period serves to confirm this: Yahya ibn 'Adi, Abu Sulayman al-Sijistani, Abu 'l-Hasan Muhammad ibn Yusuf al-'Amiri and Abu Hayyan al-Tawhidi may all be said to constitute in one form or another a 'Farabian School'. The Christian Monophysite Yahya ibn 'Adi studied in Baghdad under al-Farabi and others. Like his master, Yahya was devoted to the study of logic; like his master also, Yahya held that there was a real link between reason, ethics and politics. Al-Sijistani was a pupil of Yahya's and thus at one remove from al-Farabi; nonetheless, he shared in both his master's and al-Farabi's devotion to logic, and indeed was known as al-Sijistani al-Mantiqi (The Logician). In his use of Platonic classification and thought, al-Sijistani reveals himself as a true disciple of al-Farabi. Although al-'Amiri appears to speak disparagingly of al-Farabi at one point, there can be no doubt about al-Farabi's impact on him. Indeed, al-'Amiri's works combine the Platonic, the Aristotelian and the Neoplatonic. Finally, Abu Hayyan al-Tawhidi, a pupil of both Yahya and al-Sijistani, stressed, for example, the primacy of reason and the necessity of using logic. Like others of the Farabian School outlined above, al-Tawhidi contributed towards a body of thought the primary constituents of which were the soteriological, the ethical and the noetic.

al-Ghazali, Abu Hamid (1058-1111)

Al-Ghazali is one of the greatest Islamic jurists, theologians and mystical thinkers. He learned various branches of the traditional Islamic religious sciences in his home town of Tus, Gurgan and Nishapur in the northern part of Iran. He was also involved in Sufi practices from an early age. Being recognized by Nizam al-Mulk, the vizir of the Seljuq sultans, he was appointed head of the Nizamiyyah College at Baghdad in AH 484/AD 1091. As the intellectual head of the Islamic community, he was busy lecturing on Islamic jurisprudence at the College, and also refuting heresies and responding to questions from all segments of the community. Four years later, however, al-Ghazali fell into a serious spiritual crisis and finally left Baghdad, renouncing his career and the world. After wandering in Syria and Palestine for about two years and finishing the pilgrimage to Mecca, he returned to Tus, where he was engaged in writing, Sufi practices and teaching his disciples until his death. In the meantime he resumed teaching for a few years at the Nizamiyyah College in Nishapur.

*Al-Ghazali explained in his autobiography why he renounced his brilliant career and turned to Sufism. It was, he says, due to his realization that there was no way to certain knowledge or the conviction of revelatory truth except through Sufism. (This means that the traditional form of Islamic faith was in a very critical condition at the time.) This realization is possibly related to his criticism of Islamic philosophy. In fact, his refutation of philosophy is not a mere criticism from a certain (orthodox) theological viewpoint. First of all, his attitude towards philosophy was ambivalent; it was both an object and criticism and an object of learning (for example, logic and the natural sciences). He mastered philosophy and then criticized it in order to Islamicize it. The importance of his criticism lies in his philosophical demonstration that the philosophers' metaphysical arguments cannot stand the test of reason. However, he was also forced to admit that the certainty of revelatory truth, for which he was so desperately searching, cannot be obtained by reason. It was only later that he finally attained to that truth in the ecstatic state (*fana'*) of the Sufi. Through his own religious experience, he worked to revive the faith of Islam by reconstructing the religious sciences upon the basis of Sufism, and to give a theoretical foundation to the latter under the influence of philosophy. Thus Sufism came to be generally recognized in the Islamic community. Though Islamic philosophy did not long survive al-Ghazali's criticism, he contributed greatly to the subsequent philosophization of Islamic theology and Sufism.*

1 Life

The eventful life of Abu Hamid Muhammad ibn Muhammad al-Ghazali (or al-Ghazzali) can be divided into three major periods. The first is the period of learning, first in his home town of Tus in Persia, then in Gurgan and finally in Nishapur. After the death of his teacher, Imam al-Haramayn al-Juwayni, Ghazali moved to the court of Nizam al-Mulk, the powerful vizir of the Seljuq Sultans, who eventually appointed him head of the Nizamiyyah College at Baghdad in AH 484/AD 1091.

The second period of al-Ghazali's life was his brilliant career as the highest-ranking orthodox 'doctor' of the Islamic community in Baghdad (AH 484-8/AD 1091-5). This period was short but significant. During this time, as well as lecturing on Islamic jurisprudence at the College, he was also busy refuting heresies and responding to questions from all segments of the community. In the political confusion following the assassination of Nizam al-Mulk and the subsequent violent death of Sultan Malikshah, al-Ghazali himself fell into a serious spiritual crisis and finally left Baghdad, renouncing his career and the world.

This event marks the beginning of the third period of his life, that of retirement (AH 488-505/AD 1095-1111), but which also included a short period of teaching at the Nizamiyyah College in Nishapur. After leaving Baghdad, he wandered as a Sufi in Syria and Palestine before returning to Tus, where he was engaged in writing, Sufi practices and teaching his disciples until his death.

The inner development leading to his conversion is explained in his autobiography, *al-Munqidh min al-dalal (The Deliverer from Error)*, written late in his life. It was his habit from an early age, he says, to search for the true reality of things. In the process he came to doubt the senses and even reason itself as the means to 'certain knowledge', and fell into a deep scepticism. However, he was eventually delivered from this with the aid of the divine light, and thus recovered his trust in reason. Using reason, he then set out to examine the teachings of 'the seekers after truth': the theologians, philosophers, Isma'ilis and Sufis. As a result of these studies, he came to the

realization that there was no way to certain knowledge except through Sufism. In order to reach this ultimate truth of the Sufis, however, it is first necessary to renounce the world and to devote oneself to mystical practice. Al-Ghazali came to this realization through an agonising process of decision, which led to a nervous breakdown and finally to his departure from Baghdad.

The schematic presentation of *al-Munqidh* has allowed various interpretations, but it is irrelevant to question the main line of the story. Though certain knowledge is explained in *al-Munqidh* as something logically necessary, it is also religious conviction (*yaqin*) as mentioned in the *Ihya' 'ulum al-din (The Revival of the Religious Sciences)*. Thus when he says that the traditional teachings did not grip him in his adolescence, he means to say that he lost his conviction of their truth, which he only later regained through his Sufi mystical experiences. He worked to generalize this experience to cure 'the disease' of his time.

The life of al-Ghazali has been thus far examined mostly as the development of his individual personality. However, since the 1950s there have appeared some new attempts to understand his life in its wider political and historical context (Watt 1963). If we accept his religious confession as sincere, then we should be careful not to reduce his thought and work entirely to non-religious factors. It may well be that al-Ghazali's conversion from the life of an orthodox doctor to Sufism was not merely the outcome of his personal development but also a manifestation of a new stage in the understanding of faith in the historical development of Islam, from the traditional form of faith expressed in the effort to establish the kingdom of God on Earth through the *shari'a* to a faith expressed as direct communion with God in Sufi mystical experience. This may be a reflection of a development in which the former type of faith had lost its relevance and become a mere formality due to the political and social confusion of the community. Al-Ghazali experienced this change during his life, and tried to revive the entire structure of the religious sciences on the basis of Sufism, while at the same time arguing for the official recognition of the latter and providing it with solid philosophical foundations.

2 Theological conceptions

Al-Ghazali wrote at least two works on theology, *al-Iqtisad fi'l-i'tiqad (The Middle Path in Theology)* and *al-Risala al-Qudsiyya (The Jerusalem Epistle)*. The former was composed towards the end of his stay in Baghdad and after his critique of philosophy, the latter soon afterwards in Jerusalem. The theological position expressed in both works is Ash'arite, and there is no fundamental difference between al-Ghazali and the Ash'arite school (see Ash'ariyya and Mu'tazila). However, some changes can be seen in the theological thought of his later works, written under the influence of philosophy and Sufism (see §4).

As Ash'arite theology came into being out of criticism of Mu'tazilite rationalistic theology, the two schools have much in common but they are also not without their differences. There is no essential difference between them as to God's essence (*dhat Allah*); al-Ghazali proves the existence of God (the Creator) from the createdness (*hadath*) of the world according to the traditional Ash'arite proof. An atomistic ontology is presupposed here, and yet there are also philosophical arguments to refute the criticism of the philosophers. As for God's attributes (*sifat Allah*), however, al-Ghazali regards them as 'something different from, yet added to, God's essence' (*al-Iqtisad*: 65), while the Mu'tazilites deny the existence of the attributes and reduce them to God's essence and acts. According to al-Ghazali, God has attributes such as knowledge, life, will, hearing, seeing and speech, which are included in God's essence and coeternal with it. Concerning the relationship between God's essence and his attributes, both are said to be 'not identical, but not different' (*al-Iqtisad*: 65). The creation of the world and its subsequent changes are produced by God's eternal knowledge, will and power, but this does not necessarily mean any change in God's attributes in accordance with these changes in the empirical world.

One of the main issues of theological debate was the relationship between God's power and human acts. The Mu'tazilites, admitting the continuation of an accident (*'arad*) of human power, asserted that human acts were decided and produced (or even created) by people themselves; thus they justified human responsibility for acts and maintained divine justice. In contrast, assuming that all the events in the world and human acts are caused by God's knowledge, will and power, al-Ghazali admits two powers in human acts, God's power and human power. Human power and act are both created by God, and so human action is God's creation (*khalq*), but it is also human acquisition (*kasb*) of God's action, which is reflected in human volition. Thus al-Ghazali tries to harmonize God's omnipotence and our own responsibility for our actions (see Omnipotence).

As for God's acts, the Mu'tazilites, emphasizing divine justice, assert that God cannot place any obligation on people that is beyond their ability; God must do what is best for humans and must give rewards and punishments according to their obedience and disobedience. They also assert that it is obligatory for people to know God through reason even before revelation. Al-Ghazali denies these views. God, he says, can place any obligations he wishes upon us; it is not incumbent on him to do what is best for us, nor to give rewards and punishments according to our obedience and disobedience. All this is unimaginable for God, since he is absolutely free and is under no obligation at all. Obligation (*wujub*), says al-Ghazali, means something that produces serious harm unless performed, but nothing does harm to God. Furthermore, good (*hasan*) and evil (*qabih*) mean respectively congruity and incongruity with a purpose, but God has no purpose at all. Therefore, God's acts are beyond human ethical judgment. Besides, says al-Ghazali, injustice (*zulm*) means an encroachment on others' rights, but all creatures belong to God; therefore, whatever he may do to his creatures, he cannot be considered unjust.

The Mu'tazilites, inferring the hereafter from the nature of this world, deny the punishment of unbelievers in the grave from their death until the resurrection, and also the reality of the various eschatological events such as the passing of the narrow bridge and the weighing on the balance of human deeds (see Eschatology). Al-Ghazali, on the other hand, rejecting the principle of analogy between the two worlds, approves the reality of all these events as transmitted traditionally, since it cannot be proven that they are rationally or logically impossible. Another important eschatological event is the seeing of God (*ru'ya Allah*). While the Mu'tazilites deny its reality, asserting that God cannot be the object of human vision, al-Ghazali approves it as a kind of knowledge which is beyond corporeality; in fact, he later gives the vision of God deep mystical and philosophical meaning. In short, the Mu'tazilites discuss the unity of God and his acts from the viewpoint of human reason, but al-Ghazali does so on the presupposition that God is personal and an absolute reality beyond human reason.

3 Refutation of philosophy

Al-Ghazali's relationship with philosophy is subtle and complicated. The philosophy represented by al-Farabi and Ibn Sina (Avicenna) is, for al-Ghazali, not simply an object of criticism but also an important component of his own learning. He studied philosophy intensively while in Baghdad, composing *Maqasid al-falasifa (The Intentions of the Philosophers)*, and then criticizing it in his *Tahafut al-falasifa (The Incoherence of the Philosophers)*. The *Maqasid* is a precise summary of philosophy (it is said to be an Arabic version of Ibn Sina's Persian *Danashnamah-yi ala'i (Book of Scientific Knowledge)* though a close comparative study of the two works has yet to be made). In the medieval Latin world, however, the content of the *Maqasid* was believed to be al-Ghazali's own thought, due to textual defects in the Latin manuscripts. As a result, the image of the 'Philosopher Algazel' was created. It was only in the middle of the nineteenth century that Munk corrected this mistake by making use of the complete manuscripts of the Hebrew translation. More works by al-Ghazali began to be published thereafter, but some contained philosophical ideas he himself had once rejected. This made al-Ghazali's relation to philosophy once again obscure. Did he turn back to philosophy late in life? Was he a secret philosopher? From the middle of the twentieth century there were several attempts to verify al-Ghazali's authentic works through textual criticism, and as a result of these works the image of al-Ghazali as an orthodox Ash'arite theologian began to prevail. The new trend in the study of al-Ghazali is to re-examine his relation to philosophy and to traditional Ash'arism while at the same time recognizing his basic distance from philosophy.

Al-Ghazali composed three works on Aristotelian logic, *Mi'yar al-'ilm (The Standard Measure of Knowledge)*, *Mihakk al-nazar fi'l-mantiq (The Touchstone of Proof in Logic)* and *al-Qistas al-mustaqim (The Just Balance)*. The first two were written immediately after the *Tahafut* 'in order to help understanding of the latter', and the third was composed after his retirement. He also gave a detailed account of logic in the long introduction of his writing on legal theory, *al-Mustasfa min 'ilm al-usul (The Essentials of Islamic Legal Theory)*. Al-Ghazali's great interest in logic is unusual, particularly when most Muslim theologians were antagonistic to it, and can be attributed not only to the usefulness of logic in refuting heretical views (*al-Qistas* is also a work of refutation of the Isma'ilis), but also to his being fascinated by the exactness of logic and its effectiveness for reconstructing the religious sciences on a solid basis.

There is a fundamental disparity between al-Ghazali's theological view and the Neoplatonic-Aristotelian philosophy of emanationism. Al-Ghazali epitomizes this view in twenty points, three of which are especially prominent: (1) the philosophers' belief in the eternity of the world, (2) their doctrine that God does not know

particulars, and (3) their denial of the resurrection of bodies. These theses are ultimately reducible to differing conceptions of God and ontology. Interestingly, al-Ghazali's criticism of philosophy is philosophical rather than theological, and is undertaken from the viewpoint of reason.

First, as for the eternity of the world, the philosophers claim that the emanation of the First Intellect and other beings is the result of the necessary causality of God's essence, and therefore the world as a whole is concomitant and coeternal with his existence (see Creation and conservation, religious doctrine of). Suppose, say the philosophers, that God created the world at a certain moment in time; that would presuppose a change in God, which is impossible. Further, since each moment of time is perfectly similar, it is impossible, even for God, to choose a particular moment in time for creation. Al-Ghazali retorts that God's creation of the world was decided in the eternal past, and therefore it does not mean any change in God; indeed, time itself is God's creation (this is also an argument based on the Aristotelian concept of time as a function of change). Even though the current of time is similar in every part, it is the nature of God's will to choose a particular out of similar ones.

Second, the philosophers deny God's knowledge of particulars or confine it to his self-knowledge, since they suppose that to connect God's knowledge with particulars means a change and plurality in God's essence. Al-Ghazali denies this. If God has complete knowledge of a person from birth to death, there will be no change in God's eternal knowledge, even though the person's life changes from moment to moment.

Third, the philosophers deny bodily resurrection, asserting that 'the resurrection' means in reality the separation of the soul from the body after death. Al-Ghazali criticizes this argument, and also attacks the theory of causality presupposed in the philosophers' arguments (see Causality and necessity in Islamic thought). The so-called necessity of causality is, says al-Ghazali, simply based on the mere fact that an event A has so far occurred concomitantly with an event B. There is no guarantee of the continuation of that relationship in the future, since the connection of A and B lacks logical necessity. In fact, according to Ash'arite atomistic occasionalism, the direct cause of both A and B is God; God simply creates A when he creates B. Thus theoretically he can change his custom (*sunna*, *'ada*) at any moment, and resurrect the dead: in fact, this is 'a second creation'.

Al-Ghazali thus claims that the philosophers' arguments cannot survive philosophical criticism, and Aristotelian logic served as a powerful weapon for this purpose. However, if the conclusions of philosophy cannot be proved by reason, is not the same true of theological principles or the teachings of revelation? How then can the truth of the latter be demonstrated? Herein lies the force of al-Ghazali's critique of reason.

4 Relation to philosophy

Philosophy declined in the Sunni world after al-Ghazali, and his criticism of philosophy certainly accelerated this decline. Nearly a century later, Ibn Rushd (Averroes) made desperate efforts to resist the trend by refuting al-Ghazali's *Tahafut* in his *Tahafut al-tahafut (The Incoherence of the Incoherence)* and *Fasl al-maqal (The Decisive Treatise)*, but he could not stop it. Philosophy was gradually absorbed into Sufism and was further developed in the form of mystical philosophy, particularly in the Shi'ite world (see Mystical philosophy in Islam). In the Sunni world also, Aristotelian logic was incorporated into theology and Sufism was partially represented philosophically. In all this, al-Ghazali's influence was significant.

Ghazali committed himself seriously to Sufism in his later life, during which time he produced a series of unique works on Sufism and ethics including *Mizan al-'amal (The Balance of Action)*, composed just before retirement, *Ihya' 'ulum al-din*, his *magnum opus* written after retirement, *Kitab al-arba'in fi usul al-din (The Forty Chapters on the Principles of Religion)*, *Kimiya'-yi sa'adat* (The Alchemy of Happiness), *Mishkat al-anwar (The Niche of the Lights)* and others. The ultimate goal of humankind according to Islam is salvation in paradise, which is depicted in the Qur'an and Traditions as various sensuous pleasures and joy at the vision of God. The greatest joy for al-Ghazali, however, is the seeing of God in the intellectual or spiritual sense of the beatific vision. In comparison with this, sensuous pleasures are nothing. However, they remain necessary for the masses who cannot reach such a vision.

Resurrection for Ibn Sina means each person's death - the separation of the soul from the body - and the rewards and punishments after the 'resurrection' mean the pleasures and pains which the soul tastes after death. The soul, which is in contact with the active intellect through intellectual and ethical training during life, is liberated from the body by death and comes to enjoy the bliss of complete unity with the active intellect. On the other hand, the

soul that has become accustomed to sensual pleasures while alive suffers from the pains of unfulfilled desires, since the instrumental organs for that purpose are now lost. Al-Ghazali calls death ‘the small resurrection’ and accepts the state of the soul after death as Ibn Sina describes. On the other hand, the beatific vision of God by the elite after the quickening of the bodies, or ‘the great resurrection’, is intellectual as in the view of the philosophers. The mystical experience (*fana’*) of the Sufi is a foretaste of the real vision of God in the hereafter.

A similar influence of philosophy is also apparent in al-Ghazali’s view of human beings. Human beings consist of soul and body, but their essence is the soul. The human soul is a spiritual substance totally different from the body. It is something divine (*amr ilahi*), which makes possible human knowledge of God. If the soul according to al-Ghazali is an incorporeal substance occupying no space (as Ibn Sina implies, though he carefully avoids making a direct statement to that effect), then al-Ghazali’s concept of the soul is quite different from the soul as ‘a subtle body’ as conceived by theologians at large. According to al-Ghazali, the body is a vehicle or an instrument of the soul on the way to the hereafter and has various faculties to maintain the bodily activities. When the main faculties of appetite, anger and intellect are moderate, harmonious and well-balanced, then we find the virtues of temperance, courage, wisdom and justice. In reality, however, there is excess or deficiency in each faculty, and so we find various vicious characteristics. The fundamental cause for all this is love of the world (see Soul in Islamic philosophy).

The purpose of religious exercises is to rectify these evil dispositions, and to come near to God by ‘transforming them in imitation of God’s characteristics’ (*takhalluq bi-akhlaq Allah*). This means transforming the evil traits of the soul through bodily exercises by utilizing the inner relationship between the soul and the body. Al-Ghazali here makes full use of the Aristotelian theory of the golden mean, which he took mainly from Ibn Miskawayh. In order to maintain the earthly existence of the body as a vehicle or an instrument of the soul, the mundane order and society are necessary. In this framework, the traditional system of Islamic law, community and society are reconsidered and reconstructed.

The same is also true of al-Ghazali’s cosmology. He divides the cosmos into three realms: the world of *mulk* (the phenomenal world), the world of *malakut* (the invisible world) and the world of *jabarut* (the intermediate world). He takes this division from the Sufi theorist Abu Talib al-Makki, although he reverses the meanings of *malakut* and *jabarut*. The world of malakut is that of God’s determination, a world of angels free from change, increase and decrease, as created once spontaneously by God. This is the world of the Preserved Tablet in heaven where God’s decree is inscribed. The phenomenal world is the incomplete replica of the world of *malakut*, which is the world of reality, of the essence of things. The latter is in some respects similar to the Platonic world of Ideas, or Ibn Sina’s world of intelligibles. The only difference is that the world of *malakut* is created once and for all by God, who thereafter continues to create moment by moment the phenomenal world according to his determination. This is a major difference from the emanationist deterministic world of philosophy. Once the divine determination is freely made, however, the phenomenal world changes and evolves according to a determined sequence of causes and effects. The difference between this relationship and the philosophers’ causality lies in whether or not the relation of cause and effect is necessary. This emphasis on causal relationship by al-Ghazali differs from the traditional Ash‘arite occasionalism.

The Sufis in their mystical experience, and ordinary people in their dreams, are allowed to glimpse the world of the Preserved Tablet in heaven, when the veil between that world and the soul is lifted momentarily. Thus they are given foreknowledge and other forms of supernatural knowledge. The revelation transmitted by the angel to the prophets is essentially the same; the only difference is that the prophets do not need any special preparation. From the viewpoint of those given such special knowledge of the invisible world, says al-Ghazali, the world is the most perfect and best possible world. This optimism gave rise to arguments and criticism even in his lifetime, alleging that he was proposing a Mu‘tazilite or philosophical teaching against orthodox Ash‘arism. He certainly says in his theological works that it is not incumbent upon God to do the best for humans; however, this does not mean that God will not in fact do the best of his own free will. Even so, behind al-Ghazali’s saying that God does so in actuality, we can see the influence of philosophy and Sufism.

Al-Ghazali’s criticism of philosophy and his mystical thought are often compared to the philosophical and theological thought of Thomas Aquinas, Nicholas of Autrecourt, and even Descartes and Pascal. In the medieval

world, where he was widely believed to be a philosopher, he had an influence through the Latin and Hebrew translations of his writings and through such thinkers as Yehuda Halevi, Moses Maimonides and Raymond Martin of Spain.

Alienation

'Alienation' is a prominent term in twentieth-century social theory and social criticism, referring to any of various social or psychological evils which are characterized by a harmful separation, disruption or fragmentation which sunders things that properly belong together. People are alienated from one another when there is an interruption in their mutual affection or reciprocal understanding; they are alienated from political processes when they feel separated from them and powerless in relation to them. Reflection on your beliefs or values can also alienate you from them by undermining your attachment to them or your identification with them; they remain your beliefs or values faute de mieux*, but are no longer yours in the way they should be. Alienation translates two distinct German terms:* Entfremdung *('estrangement') and* Entaußerung *('externalization'). Both terms originated in the philosophy of Hegel, specifically in his Phenomenology of Spirit (1807). Their influence, however, has come chiefly from their use by Karl Marx in his manuscripts of 1844 (first published in 1930). Marx's fundamental concern was with the alienation of wage labourers from their product, the grounds of which he sought in the alienated form of their labouring activity. In both Hegel and Marx, alienation refers fundamentally to a kind of activity in which the essence of the agent is posited as something external or alien, assuming the form of hostile domination over the agent.*

1 Hegel

Hegel's philosophy regards all reality as *Geist*, or 'spirit' or 'mind'; Hegel's concept of spirit is at the same time a model of the human mind and human agency. It views mind or spirit as an activity which posits a reality or object distinct from itself and then for the first time achieves actuality as spirit by knowing this object as itself. Spirit is therefore a twofold activity, of creation or self-expression and of the reconciling self-interpretation of what it has created. The process through which spirit actualizes itself therefore involves an intermediate moment of 'division' (*Entzweiung*) in which its objectivity has been posited as external to it but has not yet been reconciled or taken back into it. The immediate positing of the object is 'externalization' (*Entaußerung*); the experience of it as an alien reality is 'estrangement' (*Entfremdung*). Thus spirit achieves full actuality only through becoming alienated and then overcoming its alienation. Spirit is this process not only at the level of individual activity but even more at a social level. Alienation and its overcoming are a process through which whole societies, peoples and historical traditions actualize freedom by expressing themselves in otherness, losing themselves through alienation and then regaining themselves through spiritual reconciliation (see Hegel, G.W.F. §8).

Hegel's chief use of the theme of alienation in *Phenomenology of Spirit* (1807) is to represent the rise of Christian culture out of classical antiquity as 'spirit in self-alienation' and to portray modernity as the process of overcoming this alienation. For Hegel, the paradigm of alienation is the 'unhappy consciousness', the finite, transitory, individual consciousness which feels itself cut off from its essence, which it posits in a perfect, unchanging deity residing in a 'beyond'. Or in other words, it is a form of misunderstood Christian religiosity which still has not achieved the form of Hegelian speculative pantheism. But the unhappy consciousness is merely the expression at the level of self-consciousness of a social process. 'Spirit in self-alienation' refers primarily to the loss of the social harmony which was present in the Greek *polis*, and its replacement by the supranational despotism of the Roman Empire. Because individuals no longer feel at home in their earthly society, they regard their true home as lying in a 'beyond', a 'kingdom of God'. The positive outcome of this process, however, is a deepening and transformation of individual self-consciousness through the rise of 'subjectivity': the modern conception of each individual as possessing a dignity, and of the social order as having to respect its sacred rights. Modern subjectivity also involves a transformation of the social order. As the religious alienation of the Christian Middle Ages gives way to modern moral consciousness, the right of the individual is reconciled with rational community in the form of the modern state. For Hegel, the decisive event on the spiritual level was the Lutheran Reformation; on the political level it was the French Revolution.

2 Feuerbach

Hegel's concept of alienation (although less often the term itself) is employed in Ludwig Feuerbach's critique of religion (see Feuerbach, L.A. §2). According to Feuerbach, the idea of God is really no more than the idea of our own human essence or species essence (*Gattungswesen*) projected as a supernatural entity distinct from and

opposed to us. Thus for Feuerbach, religion is the 'self-alienation of the human being, the division of the human being from himself'. The real appeal of religion is the appeal of our own self-affirmation, especially our collective or species affirmation, the appeal of a true human community and human love. But in religion this love and affirmation are actually subverted and denied, because they are misdirected toward an imaginary being alien to us. 'To enrich God, man must become poor; that God may be all, man must be nothing.' Feuerbach's critique of religious alienation is also aimed at its harmful moral and social consequences: the devaluation of our earthly wellbeing and of earthly (especially sexual) love in favour of its alienated religious counterpart, and the separation of men and women from each other in the strife of religious sectarianism and the oppressive class divisions in society. The overcoming of religious alienation is for Feuerbach the prerequisite for a transformation of real life.

3 Marx

Karl Marx used the concepts of *Entaußerung* and *Entfremdung* to portray the situation of modern individuals - especially modern wage labourers - who are deprived of a fulfilling mode of life because their life activity as socially productive agents is devoid of any sense of communal action or satisfaction and gives them no ownership over their own lives or their products. In modern society, individuals are alienated in so far as their common human essence, the actual cooperative activity which naturally unites them, is powerless in their lives, which are subject to an inhuman power - created by them, but separating and dominating them instead of being subject to their united will. This is the power of the market, which is 'free' in the sense that it is an autonomous power beyond the control of its human creators, enslaving them by separating them from one another, from their activity and from their products.

4 The alienation of labour

In the manuscript *Alienated Labour* (1844), Marx attempts to portray the social existence of human beings found in modern capitalism, and theorized by political economy, as a form of practical alienation. He distinguishes four aspects of this alienation:

(1) alienation of workers from the product of their labour;
(2) alienation of workers from their own labouring activity;
(3) alienation of individual human beings from their species essence;
(4) alienation of one human being from another.

(1) The natural relation between labour and its product is one of appropriation: labour appropriates its product for the labourer. Alienated labour, however, delivers the worker's product over to an alien power, the power of capital, which not only appropriates the worker's product but also turns it into an alien power over him. 'The object which labour produces stands opposed to it as an *alien thing*, as a *power independent* of the producer.' Further, the more workers produce, the larger grows the power of capital over them, and the more value accrues to this inhuman power, the more valueless the worker becomes. 'The worker becomes poorer the more wealth he produces…. The *increase* in the *value* of the world of things is directly proportional to the *decrease in value* of the human world.'

(2) Marx seeks the root of this relationship and locates it in the labouring activity itself. 'How could the worker stand in an alien relationship to the product of his activity if he did not alienate himself from it in the very act of production?… If the product of work is externalization, production itself must be active externalization, externalization of activity, activity of externalization.' This may be seen as the first anticipation of Marx's materialist conception of history: social and economic relationships always depend ultimately on the productive powers people employ, hence on the kind of labour they perform. But for Marx, alienated activity refers also to the fact that modern labour in factories is dehumanizing to workers, not actualizing their humanity but stunting and warping it. The lives of wage labourers are without meaning.

(3) The objective possibility for meaningful life present in all forms of social labour is that individuals confirm their humanity by contributing to the satisfaction of human needs, not only their own but even more the needs of the species. Alienated labour is meaningless labour because its conscious aim takes the egoistic form of satisfying individual needs, which for the worker are reduced to the barest conditions of physical survival. 'Life itself appears only as a *means of life*'; workers labour only to sustain the absurd cycle of their existence. By 'making species life the means of individual life' alienated labour reverses the natural relationship between the two and

hence alienates individuals from their own species essence. Since Marx regards the relation of each human being to the human species as its relation to nature, he also includes under this heading the alienation of human beings from nature, 'the inorganic body of the human species'.

(4) Finally, alienated labour alienates human beings from one another by making another human being the owner of their product, hence constituting one human being as an alien power over another human being. At the point where the *Alienated Labour* breaks off, Marx is in the process of comparing this relationship to Hegel's famous 'master-servant' dialectic in *Phenomenology*.

5 Alienation in the later Marx

The 'theory' of alienation sketched in this early fragment is Marx's first recognizable attempt to articulate the complex interconnections he sees between the various ills and irrationalities characteristic of modern industrial society. Like Hegel, the early Marx views alienation as a phase of a developmental process leading to human self-actualization. 'Alienation is founded in the essence of human development.' Yet Marx was already breaking away from Hegel and the entire 'Young Hegelian' movement (represented by Feuerbach and Marx's teacher Bruno Bauer (see Bauer, B. §1). In his view, they located the essence of alienation in a certain kind of *consciousness*, and believed that a practical reform of the social world must follow a reform in ideas, led by philosophers. In contrast to this, Marx maintained that alienation was fundamentally a matter of social practice, and that alienated forms of consciousness (such as religion) are merely a symptom of alienated activity. They can be abolished only by abolishing the alienation in real life.

Both the term 'alienation' (*Entfremdung*) and the concept (expressed in other terms) continue to play a prominent role in Marx's mature writings, especially in the *Grundrisse* (1857-8) and *Capital* (1867, 1884, 1894). But their function has changed. The philosophical concept of alienation is no longer viewed as fundamental to a systematic explanation of capitalism; it is now employed descriptively or diagnostically to characterize some of the evils and irrationalities of the system.

6 Alienation and meaningful life

The German verbs *entaußern* and *entfremden* are often reflexive, and for Marx, as for Hegel and Feuerbach, alienation is fundamentally *self*-alienation. To be alienated is to be separated from one's own essence or nature; it is to be forced to lead a life in which that nature has no opportunity to be fulfilled or actualized. In this way, the experience of alienation involves a sense of a lack of self-worth and an absence of meaning in one's life.

Alienation in this sense is not fundamentally a matter of whether your conscious desires are satisfied, or how you experience your life, but rather whether your life objectively actualizes your nature, especially your life with others as a social being on the basis of a determinate course of historical development. The view that alienation, so conceived, can nevertheless have historical consequences, and even be a lever for social change, clearly involves some sort of realism about the human good: it makes a difference, psychologically and socially, whether people actualize their nature, and when they do not, this fact explains what they think, feel and do, and can play a decisive role in historical change.

Alighieri, Dante (1265-1321)

Although Dante never received a systematic training in philosophy, he tackled some of the most controversial philosophical problems of his time. In his theory of science, he asked how we are to explain the fact that science is a unified, strictly ordered system of knowledge. He answered by comparing the scientific disciplines with the celestial spheres, claiming that the system of knowledge mirrors the cosmological order. In his political philosophy, he asked why all humans want to live in a peaceful society. All humans seek full use of their cognitive capacity, was his answer, and they can achieve it only if they interact socially. In his philosophy of nature, Dante asked what brings about the order of the elements, and suggested that the elements obey the laws of a universal nature in a strictly ordered cosmos. He elaborated all his answers in a scholastic framework that made use of both Aristotelian and Neoplatonic traditions.

1 Philosophical works and intellectual background

Dante Alighieri, best known as the author of the poetic work *Divina Commedia (Divine Comedy)*, was not only one of the most influential Italian poets but was also a scholastic philosopher, perceived and praised by his earliest commentators such as Marsilio Ficino as a 'poetic philosopher'. Three distinctively philosophical works of Dante's have been transmitted: the *Convivio (The Banquet)*, a philosophical symposium that addresses all who strive for knowledge but lack higher education; *Monarchia (The Monarchy)*, a treatise on political philosophy that aims to prove the need for a universal monarchy; and the *Questio de aqua et terra (Question on Water and Earth)*, a short work in natural philosophy that discusses the order among the elements. Since no medieval manuscript of this work is known (it has been preserved in an early printed edition), its authenticity has been disputed. In addition, the first part of his treatise *De vulgari eloquentia (On Eloquence in the Vernacular)*, dealing with the origin and function of language, includes important semantic theses, and in a long letter addressed to Cangrande della Scala, Dante expounds his hermeneutic principles.

Unlike the overwhelming majority of medieval philosophers, Dante was never a member of a monastery or a university and never received a systematic training in philosophy. Rather, he was a layman (*laicus*) in the medieval dual sense of the word: neither a clergyman nor a professional intellectual. He acquired his philosophical knowledge, as he confesses in an autobiographical passage (*Convivio* II, xii, 5), by frequenting the 'disputations of the philosophizing people' in Florence (probably in the Franciscan school of Santa Croce and in the Dominican school of Santa Maria Novella) between 1291 and 1295. He may have furthered his education during a stay in Paris (1310). However, his knowledge remained eclectic. He appears to have been more influenced by a reading of anthologies and texts by popular philosophical authors (such as Brunetto Latini) than by a systematic study of Aristotle and contemporary philosophers.

2 Scope and division of philosophy

Dante confesses (*Convivio* II, xii, 1-10) that after the death of Beatrice (the beloved woman who became Dante's guide in the Paradise, the third part of the *Divina Commedia*) in 1290, he could not find consolation until he started reading philosophical books. Cicero, Boethius and other classical authors helped him overcome his grief. He discovered that philosophy is a 'noble lady' (*donna gentile*):

> Only in glancing at her does one acquire human perfection, that is the perfection of reason, on which depends our essence as on its most fundamental part. And all our other activities, such as perceiving and nourishing, are founded upon reason. But reason exists through herself and not through something else. If reason is perfect, she is so perfect that a human being qua human being realizes that his desire is satisfied in her. And so a human is happy.
>
> (*Convivio* III, xv, 4)

This passage is not just a literary *topos* that alludes to Boethius' presentation of Lady Philosophy in the *De consolatione philosophiae (Consolation of Philosophy)*. It is also deeply rooted in the Aristotelian dictum that all human beings naturally seek knowledge - Dante opens both the *Convivio* and *Monarchia* with this famous statement - and that humans find happiness only if they satisfy their intellectual needs. Moreover, Dante's praise of intellectual activity betrays his acquaintance with certain late thirteenth-century authors sometimes labelled

‘radical Aristotelians’, such as Boethius of Dacia and Aubry of Reims (see Averroism). These Parisian masters claimed that philosophy is autonomous and should not be subordinated to any other discipline, in particular not to theology, because it provides humans with all the knowledge required for obtaining happiness. Since humans are essentially rational animals, they fully realize their capacities if they dedicate themselves to the most rational activity, philosophy.

Dante conceives of philosophy - ‘philosophy’ taken synonymously with ‘science’ (*scientia*) - as a unified system of knowledge that can be hierarchically divided. He explains the order by comparing these disciplines with the celestial spheres. There are at least three reasons, he claims, for making such a comparison (*Convivio* II, xiii, 3-6). First, every science moves around its subject, just as a celestial sphere turns around its immovable centre. Second, every science makes its subject clear and understandable, just as a celestial sphere illumines the things around which it turns. Third, every science leads to a certain perfection by structuring and explaining things, just as a celestial sphere improves things by keeping them in order and moving them. Not only is there, according to Dante, an analogy between science as a whole and the celestial spheres, but one can even attribute a specific science to each of the nine celestial spheres. There is a correspondence between each of the first seven spheres (Moon, Mercury, Venus, Sun, Mars, Jupiter and Saturn) and each of the seven liberal arts (grammar, logic, rhetoric, arithmetic, music, geometry and astrology). Physics and mathematics, dealing with innumerably many entities, correspond to the eighth sphere that consists of innumerable fixed stars. Finally, moral philosophy (including both ethics and political philosophy) corresponds to the ninth, so-called ‘crystalline sphere’, because moral philosophy enables humans to study all the other sciences just as this ninth unmoved sphere moves all the other spheres.

Not only does Dante believe, as did many medieval philosophers of science (for example, Robert Kilwardby), that philosophy (or science) is a unified, strictly ordered system of knowledge, but he also claims that the scientific system mirrors the cosmological system (see Natural philosophy, medieval). Whereas he follows the traditional scheme in his ordering of the seven liberal arts, he deliberately deviates from tradition in his claim that moral philosophy and not metaphysics, usually taken as ‘first philosophy’, is the highest scientific discipline. Although it is important to know, in the Aristotelian framework of metaphysics, what being *qua* being and its principles are, this is not the highest goal in philosophy. One obtains perfect knowledge, Dante claims, only if one is aware of the principles leading to a good life. That is why ‘morality is the beauty of philosophy’ (*Convivio* III, xv, 11). When one takes this important claim into account, it becomes clear why Dante emphatically holds that human happiness is to be sought through philosophy. Since moral philosophy, the culmination of every scientific activity, enables humans to recognize the principles governing a good life in a peaceful community, humans must philosophize if they want to attain such a life (see Happiness).

3 Political philosophy

In the *Monarchia*, a treatise that is highly scholastic in both style and content, Dante aims to show first, that a universal monarchy is necessary for a peaceful community of humans, second, that the Roman nation legitimately acquired its hegemony over all other nations, and third, that the power of the Roman emperor is not subordinate to that of the pope. Thus the main purpose of the work is clearly political and has to be understood in the light of the late medieval controversies over mundane and spiritual power (notably those between King Philip the Fair of France and Pope Boniface VIII). Yet in his defence of the Roman emperor, Dante makes a rich use of philosophical arguments, often going beyond the concrete political context. This becomes clear from his discussion of the principle governing human behaviour, a principle that underlies all his political theses, as he explicitly says (*Monarchia*, I, ii, 8).

Dante starts his search for such a principle by asking why humans want to live in a community. Following the Aristotelian tradition, he gives a teleological answer; all humans have certain goals they want to obtain. However, unlike most medieval authors in the Aristotelian tradition, he claims that there is not only a goal for each individual, each household and each city, but also a goal for the entire human species. This goal is to be attained only through an activity of the entire species. Such an activity consists in all realization of the ‘possible’ intellect (*Monarchia* I, iii, 8), that is, in an exhaustive development of one’s cognitive capacity. An isolated person, limited in activity, is never able to achieve such development, which requires one’s integration into a peaceful community in which all humans participate.

It is remarkable and original in the medieval context that Dante uses an epistemological argument to justify his

political theory. Neither a natural order established by God, nor a need for protection, nor a need for exchanging goods and making contracts is the main reason for which humans want to live in a peaceful community. Rather, the main reason is an intellectual need; humans want to use their cognitive capacity. Following Aristotle, Dante claims that this capacity is nothing other than the possible intellect that is 'realized', or put to active use, when it receives the forms of the cognized things. But, unlike Aristotle, he does not take the use of this intellect to be a mere individual operation; and, contrary to some radical Aristotelians (for example, Boethius of Dacia or Siger of Brabant), he does not hold that every person is an autonomous cognizer, capable of acquiring all possible knowledge through an individual contemplation of the highest principles. Nor does he make the controversial Averroistic claim, as his first critics (such as Guido Vernani) complained, that there is just one possible intellect for all humans, so that every individual would be dependent upon this all-embracing intellect. Rather, Dante holds that every person has an individual possible intellect; but one can make full use of one's own possible intellect only if one is a member of a peaceful community. Thus, social interaction is a *sine qua non* for successful cognitive activity (see Political philosophy, history of).

4 Natural philosophy

In the *Questio*, a written record of a scholastic debate, Dante (if indeed the text was written by him) raises the question of how the elements water and earth are related to each other. Which element has a higher location, water or earth? At first sight, this question seems puzzling or even pointless. Is it not obvious that there are some places (such as the mountains) where earth is higher, and others (such as the sea) where water is higher? But considered from a medieval point of view, the question points to a serious problem. According to the geocentric model that was strongly influenced by the Euclidean theory of spheres, the terrestrial world is located in the middle of a spherical cosmos and consists of four spherically ordered elements: earth, water, air and fire. The element water completely surrounds and covers the element earth, located in the middle of all the spheres. Thus we are confronted with a conflict between the common sense view that there is no fixed order among the elements, and the theoretical view that there must be a strict order according to the spherical model.

In light of this conflict, it is not surprising that the question raised by Dante was a prominent puzzle in medieval philosophy of nature (Duhem 1958: 79-235). Dante tried to resolve this dilemma by introducing a distinction between two kinds of nature. The 'universal nature' is present in the celestial spheres and determines the movement of all terrestrial things. The 'particular nature', on the other hand, is present in each terrestrial thing and makes it tend toward the place it is suited for. So, according to the particular nature, inherent in the elements, earth tends toward the middle of all elements and is completely covered by water. However, the universal nature is able to influence and change this tendency so that there can be some dry places (the so-called 'habitable parts') where earth emerges from water and, therefore, has a higher location than water (*Questio* 49). Dante claims that this general nature is to be found in the eighth sphere, the 'crystalline sphere' (*Questio* 69).

This explanation allows Dante to maintain the geocentric spherical model without rejecting the common sense view. It also allows him to avoid the solution suggested by earlier authors such as Andalò del Negro, that the two spheres (earth and water) may not be concentric. Such a solution would threaten the entire cosmological model. If there is no concentricity, neither is there any guarantee that all the spheres - and not just one element - will revolve around the earth. While insisting on the concentric order, Dante introduces a distinction between two kinds of nature that betrays a Neoplatonic background: God, the first cause of everything, created the celestial spheres, which act as secondary causes. Thus the cosmos is taken to be a strictly ordered, closed system in which the place and movement of every singular thing or element can be explained in terms of its dependency on certain causes (see Natural philosophy, medieval).

Alison, Archibald (1757-1839)

Archibald Alison was born in Edinburgh but was educated at Balliol and ordained in the Church of England. He returned to Edinburgh in 1800 as an Anglican clergyman and served there until his death. His published works included collections of sermons, but he is best known for his Essays on the Nature and Principles of Taste. This work was published in 1790, the same year as Immanuel Kant's third Critique; but it became popular only after a second edition appeared in 1811.

Archibald Alison, Anglican clergyman, born in 1757 in Edinburgh, broke with earlier eighteenth-century theorists of taste in two respects. He denied that taste is a product of an internal sense, and he described the emotion of taste as complex rather than simple. Earlier theorists had developed taste using the analogy of sense perception. The exact nature of this sense varied. In some cases it was taken quite literally; in others, it was little more than a convenient analogy. In general, however, an internal sense was a reflexive, immediate response of the mind to qualities presented by objects. Alison abandoned such a sense altogether. Instead, the emotions of taste are the product of mental operations to which the mind contributes and in which the mind discovers its own qualities. Such emotions are inherently complex. Alison reasoned that if a simple perceptual quality such as colour were the source of an emotion of taste, that emotion would always accompany perceptions of colour. Such is not the case. Only when the mind operates on the perception in a certain way does the emotion of pleasure identified with taste occur.

In place of a simple emotion and an internal sense, Alison introduced expression, imagination, and association as the key aesthetic terms. Imagination is a faculty which acts upon simple emotions. It suggests other images which are not directly present but which share the emotional qualities of the perception. The emotional links themselves are formed by association. So both imagination and association are necessary conditions for emotions of taste. When, in addition, the emotions are expressive of qualities of mind, one has emotions of taste - what Immanuel Kant and later theorists came to call aesthetic emotions. Alison projected the following schema: natural objects are suited to produce simple emotions; those simple emotions are extended by association and take on qualities of mind (for example tenderness); the imagination is the faculty which accomplishes this extension. When the imaginative associations are unified throughout an occasion, the result will be a special emotion of taste - either beauty or sublimity, depending on the emotion. Pleasure always accompanies this extension.

Alison went substantially beyond earlier theorists in the way that he developed expressiveness as a quality of mind and in the way that he used association. Earlier eighteenth-century theorists, including Joseph Priestley, Alexander Gerard, and Thomas Reid, all spoke of a certain kind of mental exertion as intrinsically pleasurable and thus as a key element in taste. They were thinking of a physiological phenomenon, however. Strong, violent mental exertion could not produce the calm passions of beauty, but neither could a too languid mental operation. The emotions of taste were conceived of as belonging to the middle range - neither too strong, nor too mild. Alison, on the other hand, thought not of the exertion of the mind, but of qualities which, through association, became expressive of the mind's own powers. A natural quality becomes beautiful by acquiring mental associations.

Alison's theory of association is also substantially different as a consequence. Earlier theories of association, particularly that of David Hartley, sought to account for how the mind could produce ideas in the absence of immediate experience. The function of association was thus to extend experience and to provide a mechanism for the recall and production of mental images. Hartley's account is strongly mechanistic, for example. Alison used association differently. By itself, a colour would produce no emotion, he reasoned. But association connects perception with other experiences so that the emotional qualities of the complex are produced by the perception as well. So red can be exciting, white pure, and so forth. Association brings together disparate images and ideas into a complex which has emotional consequences. Its faculty is imagination, and its consequence is expression. Beauty is the complex result of a kind of associative network. These associations give rise to a multitude of predicates, and Alison made extensive use of language as an indicator of what emotional associations a particular kind of perception had acquired.

Alison distinguished natural from relative beauty. Natural beauty arises from the associations the mind forms in its direct encounters with the world. Alison's paradigms for natural beauty are scenery and gardens. Relative beauty

depends on associations which suggest a fitness and utility; it includes design, skill, and art. Thus Alison established an implicit hierarchy, in which art is secondary to nature as an aesthetic source. Design, fitness, and utility presuppose a mental order and a mind, so they are expressive and beautiful. But their expressiveness depends on complex emotions such as tenderness, grandeur, and majesty, which are first inspired by the imagination acting on natural scenes. The common feature is that both produce a special form of pleasure, which Alison, like Kant, called delight.

Alison continued a century-old tradition of speculation about taste and beauty along empiricist lines. He shared with that tradition a reliance on experience and an attempt to classify and codify elements of experience into a theory of beauty. Alison extended that empiricism in a significant way, however. His analysis relies on language, particularly emotive predicates. Association is based on similarity - which may be perceptual or metaphorical, but is always created by the mind itself. The imagination becomes a creative faculty, and aesthetic theory is less concerned with standards and epistemological questions than with the production of emotion. Alison remained a moralist. Nature, not art, is the source of emotion, and nature is God's handiwork, not ours. But it is a short step from Alison's forms of imagination and expressiveness to that of the Romantics who use many of the same terms. The aesthetic ground has shifted substantially.

al-Juwayni, Abu’l Ma‘ali (1028-85)

Al-Juwayni rose to great prominence as a theologian in the Islamic world, and his theoretical discussions of philosophical issues played a significant role in the development of Islamic philosophy. He provided a stout defence of the Ash‘arite theory that emphasizes the power of God and the insignificance of human beings. His work on the meaning of scriptural texts provided Muslims with a sophisticated and productive series of concepts with which to discuss issues of interpretation.

1 Life and works

Born in Juwayn in Persia, al-Juwayni spent his life defending the principles of Ash‘arism (see Ash‘ariyya and Mu‘tazila). By the time of his death he was widely known as the Imam al-Haramayn, the imam of the two great mosques of Mecca and Medina. This gives some indication of the influence of his thinking in the Islamic world. He worked in an interesting time of transition between the original Ash‘arite *kalam* (theology) (see Islamic theology) and the more radical developments which were to be undertaken by al-Ghazali.

Al-Juwayni argued that there are some forms of knowledge which are available to contingent beings such as ourselves, yet this knowledge is itself irretrievably contingent and should be distinguished from the sort of knowledge which God has. Although God is not a body and is neither a spatial nor temporal being, it is nonetheless possible for him to be seen, in the next life, through beatific vision. God is completely free, acting for no reason other than that which he gives himself. There is nothing necessary about causality, and the possibility of miracles is based upon the fact that there is nothing fixed about nature. God is not only the creator of the universe in the sense of being the first cause, but he is also the agent who is the cause of its continuous existence. The existence of the world at every moment depends upon God’s will. God is the sole creator, and even our actions do not really originate with us but are acquired from God.

The route to an understanding of the Qur’an is through a thorough grounding in the Arabic language. Al-Juwayni distinguishes between different kinds of text. Some texts are obvious and clear, some are accurate, some are concealed and yet others are obscure. Texts which are clear do not change their sense, whatever context they appear in. Those which are accurate have a sense which is clearly linked to a particular state of affairs which the text describes, and present no difficulties. Concealed texts have two sorts of meaning, one which requires interpretation by a prophet and his followers, or one which is capable of explanation by a body of readers who really understand the difficulties of what is before them. Obscure texts require *ta’wil* or analogical interpretation, in accordance with which the correct meaning will be carefully extended from the actual forms of words which are used. This form of interpretation should only be used as a last resort, and it is replete with dangers in that it can lead to a loose and undisciplined approach to understanding the meaning of scripture. Al-Juwayni presents in his work a highly organized system of hermeneutics designed to make scripture accessible and yet also restricted within particular theological boundaries.

2 Ethics

Al-Juwayni was a staunch defender of the Ash‘arite view of the basis of value judgments, which is entirely scriptural. What is good is what is said to be good in scripture, and what is bad is what scripture condemns, and there is no other basis to such judgments. Any attempt at finding a rational foundation is flawed, and it can be assumed that here he had the Mu‘tazilites in mind. He suggests that the Mu‘tazilites are wrong in thinking that there are basic rational moral truths, since if this were the case there would be no possibility of widespread moral disagreement, something which quite clearly does arise. Similarly, the idea that particular forms of behaviour are absolutely right or wrong is difficult to establish, given that we often base our judgments here on the context surrounding those actions and the precise nature of the agent (see Ethics in Islamic philosophy). For example, an adult and a child may perform a similar action; the former action may be called evil, but this is not appropriate as a description of the child’s action.

In his account of what it means for God to be obliged to act in certain ways, al-Juwayni totally rejects such language. He argues that it is mistaken to talk about God being under any obligation to his creatures at all. He often pokes fun at the very idea of explaining the sometimes tragic events of this world as part of an objective

divine plan. God does not need to operate in accordance with such a plan; this would be to deny the uniqueness of God and his radical separation from his creatures. Al-Juwayni argues that his thesis has the advantage of not needing to provide implausible explanations of why things are as they are in the world. The world is as it is because of the decisions of the deity, but we cannot fathom his reasons for those decisions and it is entirely inappropriate to hold him liable to adhere to an essentially human system of justice.

al-Kindi, Abu Yusuf Ya‘qub ibn Ishaq (d. *c*.866-73)

Practically unknown in the Western world, al-Kindi has an honoured place in the Islamic world as the 'philosopher of the Arabs'. Today he might be viewed as a bridge between Greek philosophers and Islamic philosophy. Part of the brilliant ninth-century 'Abbasid court at Baghdad, composed of literati of all types, he served as tutor for the caliph's son. He gained insights into the thought of Greek philosophers, especially Aristotle, through the translation movement; although he did not make translations himself, he corrected them and used them advantageously in his own thought.

Al-Kindi is notable for his work on philosophical terminology and for developing a vocabulary for philosophical thought in Arabic, although his ideas were superseded by Ibn Sina in the eleventh century. The debate about the allowability of philosophy in terms of orthodox Islam also began with al-Kindi, a battle that is usually considered to have been won for religion by al-Ghazali. Like other innovators, his ideas may no longer appear revolutionary, but in his own day, to push for the supremacy of reason and for the importance of a 'foreign science' - philosophy - as opposed to an 'Arab science' - grammar, Qur'anic studies - was quite astonishing. When the Khalif al-Mutawwakil came to power and sought to restore traditionalism, al-Kindi suffered a reversal of fortunes.

1 Logic and translation

Abu Yusuf Ya‘qub ibn Ishaq al-Kindi was an ethnic Arab (died in Baghdad between AH 252-60/AD 866-73), with an illustrious lineage going back to such near-mythic Arabian families as Qays. Al-Kindi was known as 'the philosopher of the Arabs' in contrast to the later Islamic philosophers who, though Muslim, were not Arabs and often learned Arabic as a second language. The early bio-bibliographers gave his ancestry and a long list of works, many of which are no longer extant, but his personal life remains unknown. Although he is remembered for introducing philosophy to the 'Abbasid court, his skills covered many fields including medicine, mathematics, music, astrology and optics. He also served as tutor to the son of the Khalif al-Mu‘tasim. Al-Qifti, one of the medieval Islamic bio-bibliographers, pointedly asserted that al-Kindi was skilled in the arts of the Greeks, the Persians and the Hindus.

Al-Kindi used early, Arabic-language translations of Greek philosophy, which enabled him to add part of the Hellenistic tradition to his programme. The founding of the *bayt al-hikma* (house of wisdom), for the large-scale translation of documents from Greek, in the early ninth century meant both that the 'foreign sciences' were available wholesale to Arabophone scholars and that there was serious interest in the knowledge they contained. Al-Kindi was occasionally credited (in the title inscription) with correcting the translation, but it is generally accepted that he did not read Greek himself. The pursuit of 'foreign sciences' was also politically acceptable at this juncture, which ceased to be the case later. A study of his terminology shows that al-Kindi was aware of particular terms used in Hellenistic philosophy, and of which Arabic word best expressed the same idea.

Al-Kindi may be thought of as a stage-setter for philosophy in the Islamic world, laying out terms *qua* terms and redirecting the metaphysical concerns suggested by the *mutakallimun* (theologians) from the realm of religion to that of philosophy. His lack of interest in religious argument can be seen in the topics on which he wrote. These topics were ontological, but he generally refrained from eschatological discussions on topics such as the resurrection, the last day and the last judgment. Even in his ethical treatise he dealt with the disciplined life in which a person might find interior serenity in their current life, rather than an emphasis on reward in the hereafter. Scholars have sometimes thought of al-Kindi as a Mu‘tazili sympathizer, but this has not been proved; he appears rather to coexist with the worldview of orthodox Islam.

Al-Kindi's work on definition is *Fi hudud al-ashya' wa-rusumiha (On the Definitions of Things and their Descriptions)*. Through the terms he chose to define - finitude, creation, the first cause - we can see where the constructs of Islamic philosophy diverged from their Greek predecessors. In the eleventh century the *Kitab al-hudud (Book of Definitions)* of Ibn Sina replaced al-Kindi's work; this was considerably more advanced, both in its definitions and in its organization of the world into a concise ontological schema.

2 Metaphysics

Al-Kindi's best known treatise is the metaphysical study, *Fi al-falsafa al-ula (On First Philosophy)*. Aristotelian

influence can be seen in certain elements, such as the four causes. However he is Aristotelian only up to a point. The point of divergence is reached over the question of the origin of the world. Aristotle teaches the eternity of the world; Al-Kindi propounds creation *ex nihilo*. The later philosophers, such as al-Farabi, are usually considered to understand Aristotle more accurately; they had the advantage of better translations and a greater number of works. In *Fi al-falsafa al-ula*, al-Kindi described the first philosophy, which is also the most noble and highest philosophy, as the knowledge of the first truth, including the cause of every truth (the first cause). The first cause is prior in time because it is the cause of time. By the study of philosophy, people will learn the knowledge of things in reality, and through this the knowledge of the divinity of God and his unity. They will also learn human virtue. Throughout many of his treatises, al-Kindi emphasizes the importance of the intellect (*‘aql*) and contrasts it with matter.

He also discusses the One Truth, which is another name for God, and states that it does not have any attributes, predicates or characteristics. This view is consonant with the Mu‘tazili declaration of the unity of God as being strictly without attributes, and consequently al-Kindi has sometimes been deemed to be a Mu‘tazili by scholars.

Other aspects of his position include emphasis on the absolute unity of God, his power - particularly as creator - and creation *ex nihilo*. The Eternal, that is God, is not due to another; he has no cause and has neither genus nor species. There is no ‘before’ for the Eternal. The Eternal is unchanging, immutable and imperishable. In human terms, death is the soul’s taking leave of the body, which it employed during life. For al-Kindi, the intellect continues. Perhaps the soul is primarily the locus of the intellect. He reiterated in his ethical treatise the idea that humans must choose the world of the intellect over the material world (see §3).

Al-Kindi differs from the Hellenistic philosophical tradition primarily in espousing the belief that the world was created *ex nihilo*. In Aristotelian metaphysics the Prime Mover set the world in motion, but in the Hellenistic tradition, time and motion are intrinsically linked. Matter set in motion is eternally existing, since it exists before motion (and therefore before time). In this system, time is defined as the extension of the series of movements. Thus time begins with movement. In al-Kindi’s system, matter, time and movement are all finite, with a beginning and a cessation at some future point. Other subjects that concern al-Kindi can be seen from his titles, including *Fi wahdaniya Allah wa tunahiy jirm al-‘alam (On the Unity of God and the Limitation of the Body of the World)*, and *Fi kammiya kutub Aristutalis wa ma yahtaj ilahi fi tahsil al-falsafa (The Quantity of the Books of Aristotle and What is Required for the Acquisition of Philosophy)*.

In his philosophical writings, al-Kindi does not so much direct arguments to the concerns of religion as avoid them altogether, instead describing a parallel universe of philosophy. He consistently tries to show that the pursuit of philosophy is compatible with orthodox Islam. The *mutakallimun* had previously speculated on questions about matter, atoms and substance, which he also considers. Another reason for the claim that he was a Mu‘tazili was his persecution by the Khalif al-Mutawwakil, who instigated a reactionary policy against the Mu‘tazili and a return to traditionalism (see Ash‘ariyya and Mu‘tazila). Al-Kindi was caught in the general net of the Khalif’s anti-intellectualism; the Kindian emphasis is always on rationalism, an attitude which the orthodox establishment of a revealed religion is bound to find inimical.

3 Ethics

Al-Kindi’s ethics and practical philosophy are most discussed in a treatise *Fi al-hila li-daf‘ al-ahzan (On the Art of Averting Sorrows)*, of questionable authenticity. Fehmi Jadaane (1968) argues that al-Kindi was strongly influenced by the Stoic tradition, particularly the thought of Epictetus, which was known throughout the Islamic world at the time through contact with Syriac Christian scholars, if not through specific texts. Epictetus emphasized the importance of freedom from the world and human beings’ status as agents, who through their ultimate independence were responsible for their own happiness and independent of others. His last logical step, however, was that suicide was permissible if life was no longer worth living. This last idea is not repeated in al-Kindi.

Like the writings of the Stoics, al-Kindi’s treatise, which is of the ‘consolation of philosophy’ type, exhorts readers to concentrate on the life of the mind and the soul, not of the body (see Stoicism). Al-Kindi says that human beings are what they truly are in the soul, not in the body. Again, on the futility of looking for eternities in the visible world, he says that whoever wishes for what is not in nature wishes for what does not exist. The reader is

admonished that unhappiness follows such an attitude. In this treatise, al-Kindi advocates maintaining an internal balance through the mechanism of the individual's interior autonomy. If worldly property becomes a concern and is then lost or damaged, this will upset an individual's mental equilibrium. Stoic ideas about the ephemeral nature of earthly goods are recalled; al-Kindi warns against attachment to favourite worldly goods, using an example from Plutarch's *On Moral Virtue*. In that story, Nero receives a gift of a gorgeous, elaborate crystal tent, with which he is obviously smitten. A philosopher who is present in the crowd advises him that he has already been impoverished through his keen attachment to this object. If Nero were to lose it, the philosopher says, he will suffer because it is irreplaceable. Later when the rare object is lost at sea during transport, Nero is devastated. Scholars have argued that this treatise appears to be a mélange of wisdom literature from various Hellenistic sources, with no ideas that sound Kindian. Ibn Miskawayh refers to the ideas of al-Kindi in his treatise on ethics, *Tahdib al-akhlaq*.

Some ethical remarks are contained in other treatises. The virtues discussed in the treatise on definitions are wisdom, courage and temperance. A reflection of each virtue which exists in the soul is seen in the body. Virtue exists as a focal point between two extremes. Bravery, for example, is both mental and physical; it is midway between rashness and timidity.

Some reverberations of al-Kindi's thought also continued in the twelfth-century Christian Latin West, as certain of his treatises were translated into Latin by the Scholastics, notably *De intellectu (On the Intellect)*. In the thirteenth century Giles of Rome criticized ‘Alkindus’ with other philosophers in his work *Errores philosophorum (Errors of the Philosophers)*. Only a portion of al-Kindi's work survives, so judgment of him must necessarily be imperfect. However, al-Kindi's influence endured longer in the Western Islamic tradition than in the Eastern, as reflected in the writings of the twelfth-century mystic Ibn al-‘Arabi. With al-Kindi, who pursued reason against the background of revealed religion, begins the Islamic philosophical tradition which continues with the works of Ibn Sina and Ibn Rushd.

al-Muqammas, Daud (*fl.* 9th century)

*Daud ibn Marwan, called al-Muqammas, is the first Jewish thinker known to have written in Arabic and one of the earliest Arabic speaking theologians whose work is extant. He also wrote on logic, biblical exegesis, doxography and polemical matters. His pioneering efforts toward a systematic Jewish philosophy show the influence both of Muslim theology (*kalam*) and the Aristotelian philosophy taught in the Syriac Christian academies.*

The main sources for al-Muqammas' biography are the tenth century Karaite author al-Qirqisani and al-Muqammas' own works. He was called al-Raqqi, suggesting that he came from the city of Raqqa, located in what is today northern Syria; he was also called ha-Bavli, 'the Mesopotamian'. The sobriquet 'al-Muqammas' ('he who wears a *qamis*', the latter referring to a shirt or shift) reflects his position at the crossroads between the early Arabicized Jewish commmunity and the Syriac-speaking Christian community; an Arabic life of St Anthony applies this term to an Arab or one who dressed like an Arab. By his own testimony, he took part in a theological debate with a Muslim in Damascus. At one point he converted to Christianity and studied philosophy for many years in Nisibis with one Nana (probably Nonnus of Nisibis, d. *circa* 860), but his anti-Christian polemics show that he returned to Judaism, and all his extant works were written after that point. Although he was claimed by later Karaite authors there is no independent evidence to date that he was a Karaite (see Karaism).

Al-Muqammas' writings reflect the intellectual curiosity that may have been a factor in his conversion and reconversion. In a *summa* entitled *'Ishrun maqala (Twenty Chapters)*, almost sixteen chapters of which are extant, al-Muqammas sought answers to basic philosophical questions about knowledge, the world, God, humanity, and revelation. His questions were about the existence and character (the what, how and why of each of his subjects). In dealing with these matters, he was prepared to weigh the merits of rival religious traditions. After a short introduction to Aristotelian logic, the *'Ishrun maqala* follows the pattern well known to us in works of *kalam*, arguing each of its points against the background of a refutation of rival opinions. Thus al-Muqammas accompanies his arguments for *ex nihilo* creation with polemics against sceptics and materialists. His proofs of God's existence and unity include lengthy polemics against dualism, Christianity, and anthropomorphism. The same polemical or apologetic posture is adopted in the discussions of free will, prophecy (and the veracity of the Mosaic revelation) and accountability in the hereafter. The final chapters, which discussed other religions, are lost. Although clearly meant to vindicate Judaism, the work notably lacks quotations in Hebrew and other features that might have limited its audience to a Jewish readership. The Christian influence is highly visible throughout, not least in the extended polemics against Christianity.

Al-Muqammas' anti-Christian polemics also include a short, aggressive work entitled *al-Masa'il al-khamsin radd 'ala al-nasara min tariq al-qiyas (Fifty Questions for the Logical Refutation of Christianity)*, fragments of which were found in the Cairo Geniza, and a lost longer work, the *Kitab al-dara'a (Book of Urging on to Attack)*, which apparently discussed the history of Christianity. Al-Muqammas translated from Syriac and adapted to Judaism commentaries on Genesis and Ecclesiastes. A surviving fragment of the commentary on Genesis reveals that this earliest example of Judaeo-Arabic exegesis follows the rationalistic hermeneutical method of the Syriac Christian exegetes. Al-Muqammas also wrote a commentary on Aristotle's *Categories* and a refutation of Indian religions, both known to us only by title.

Al-Muqammas' writings preserve an early stage of Judaeo-Arabic philosophy, which in turn reflects the early stages of Islamic philosophy and theology. Thus we see the formulaic and apologetic character of *kalam* (see Islamic theology) alongside the fusion of Neoplatonic and Aristotelian ideas characteristic of *falsafa* (see Aristotelianism in Islamic philosophy; Neoplatonism in Islamic philosophy). The boundaries between these disciplines were then much less pronounced than the later became, but the hybridization may also reflect al-Muqammas' unique position rather than the state of the disciplines in his time. As a Jewish author uncommitted to Muslim or Christian traditions, he could freely borrow from both. As one of the first Jews to write in Arabic, he was not constrained by set patterns of borrowing.

Al-Muqammas' polemics against predestination and anthropormorphism have close Islamic parallels, especially in Mu'tazilite writings (see Ash'ariyya and Mu'tazila). In discussions of physical theory, however, the Christian influence is more pronounced. Thus, in a manner that was typically Christian but was later widespread among

Jewish thinkers, he defines 'substance' and 'accident', as 'that which exists in itself' and 'that which exists in another'. These definitions echo the Aristotelian approach and break sharply with the atomism of the occasionalist Muslim *mutakallimun* (theologians or dialecticians, practitioners of *kalam*) (see Epistemology in Islamic philosophy); but al-Muqammas does not develop a systematic Aristotelian cosmology, and he hardly ever uses the concepts of matter and form.

Often, al-Muqammas fuses Muslim and Christian ideas. For example, in subordinating God's attributes to his absolute unity, he uses formulae found in later *kalam* works ('God lives with a life that is identical with Him', or 'God lives but not by life'). To elucidate these statements, however, he uses similes found in Christological treatises as illustrations of trinitarianism.

Al-Muqammas' originality is hard to gauge. A certain stiffness in his style may be the price he paid for venturing into new areas. Today his ideas and expositions look familiar or trite, but it is easy to forget that their familiarity to us comes from later authors. Al-Muqammas' openness to neighbouring cultures and his ability to adapt their materials are clearly the basis of his most original contributions to Jewish philosophy.

His influence is most noticeable in the works of al-Qirqisani and the later Karaites. In Rabbanite circles he is overshadowed by the towering figure of Saadiah Gaon, but he is cited by Rabbanite authors including Bahya ibn Paquda, Moses ibn Ezra, Judah ben Barzillai and Yedaya Ha-Penini, in a tradition extending down to the fourteenth century. That his work was apparently never translated *in toto* into Hebrew both expresses and contributes to the loss of his influence among later thinkers.

al-Razi, Abu Bakr Muhammad ibn Zakariyya' (d. 925)

Perhaps the most famous and widely respected Islamic authority on medicine in the medieval period, al-Razi also aspired to a comparable achievement in philosophy and the other sciences such as alchemy. His success in these other subjects, however, was seldom recognized either in his own time or later; in philosophy, for example, more writers cite him for purposes of rejection and refutation than for admiration and emulation. However, his ideas were and are important. Chief among his positive contributions is his advocacy of a doctrine of equal aptitude in all humans, which grants no special role for unique and divinely favoured prophets and which recognizes the possibility of future progress in the advancement of knowledge. Philosophically, al-Razi was by his own admission a disciple of Socrates and Plato, much of whose teaching he knew on the basis of the latter's Timaeus. *Accordingly, he was noted for upholding the eternity of five primary principles, God, soul, time, matter and space, and for a concept of pleasure that sees it as the return to a normal harmony following a serious deviation or disruption which is itself pain.*

1 Life and work

Al-Razi's main career was that of a physician, and in that field he earned great respect and wide acclaim even from his most vociferous detractors in other matters. He directed two major hospitals, one in Baghdad, the capital of the Islamic empire at that time, and another in his native city of Rayy in northern Iran. His voluminous writings on medicine were universally admired. Despite advancing infirmities, he continued his research and writing into old age, still surrounded by students and assistants when he died in AH 313/AD 925. In Christian Europe he was known as Rhazes, and his works on medicine were highly respected.

The whole of al-Razi's work, both in medicine and the physical sciences and in philosophy, derives its central concern from his naturalistic view of the universe as like a 'visible animal' which, in contrast to almost all of the other philosophers in his era, he regarded as a subject of empirical scrutiny. At the heart of his philosophy lies Plato's *Timaeus*, which seems to have been al-Razi's ultimate inspiration (see Plato). He displayed almost no interest in the rest of Plato, although curiously he was the most avowedly loyal follower of Plato in Arabic and Islamic literature. His other idol was, as might be expected, Socrates, whose way of life he attempted to emulate, advocate and defend; although al-Razi's Socrates was not the extreme ascetic of an earlier period in Socrates' life but rather a later, fully participating social being. For Aristotle he had little use, rejecting outright commonly accepted doctrines that had deeply influenced his philosophical contemporaries (see Aristotelianism in Islamic philosophy). Unusually for his time, al-Razi boldly claimed that he could and had moved beyond his ancient philosophical predecessors and that neither the religious prophets nor the Greek masters (nor even al-Razi himself) possessed the final word or ultimate truth. Others in the future can and will surpass the achievements already realized by the great minds of the past and present.

Although denying prophetic religion, al-Razi's own ethical philosophy suggests a kind of religion that encompasses God and the universal soul, and hints at the salvation of particular souls. Nevertheless, writings of his on the falsity of prophets were broadly and specifically condemned and he was branded an arch-heretic for them. An opponent quotes him as claiming that the Qur'an yields no information of particular value in comparison with the books of Ptolemy, Euclid, Hippocrates, Galen, Plato or even Aristotle. It is clear that al-Razi would not accommodate revealed religion, which he saw as both particularistic and divisive. There is thus no harmony to be found between such religion and philosophy - a dangerous and certainly radical stance to take in his day. Al-Razi's metaphysical doctrines received no approval from later scholars. As a consequence, with the exception of two treatises on ethics, few of his non-medical works survive, thereby making a fair and detailed judgment of his ideas now difficult and often impossible.

2 Metaphysics

The metaphysical doctrine of al-Razi, insofar as it can be reconstructed, derives from his concept of the five eternal principles. God, for him, does not 'create' the world from nothing but rather arranges a universe out of pre-existing principles. His account of the soul features a mythic origin of the world in which God out of pity fashions a physical playground for the soul in response to its own desires; the soul, once fallen into the new realm God has made for it, requires God's further gift of intellect in order to find its way once more to salvation and

freedom (see Soul in Islamic philosophy).

In this scheme, intellect does not appear as a separate principle but is rather a later grace of God to the soul; the soul becomes intelligent, possessed of reason and therefore able to discern the relative value of the other four principles. Whereas the five principles are eternal, intellect as such is apparently not. Such a doctrine of intellect is sharply at odds with that of all of al-Razi's philosophical contemporaries, who are in general either adherents of some form of Neoplatonism or of Aristotelianism.

The remaining three principles, space, matter and time, serve as the non-animate components of the natural world. Space is defined by the relationship between the individual particles of matter, or atoms, and the void that surrounds them. The greater the density of material atoms, the heavier and more solid the resulting object; conversely, the larger the portion of void, the lighter and less solid. Time and matter have both an absolute, unqualified form and a limited form (see Matter; Time). Thus there is an absolute matter - pure extent - that does not depend in any way on place, just as there is a time, in this sense, that is not defined or limited by motion. The absolute time of al-Razi is, like matter, infinite; it thus transcends the time which Aristotle confined to the measurement of motion. Al-Razi, in the cases of both time and matter, knew well how he differed from Aristotle and also fully accepted and intended the consequences inherent in his anti-Peripatetic positions.

3 Ethical and moral philosophy

More can be said about al-Razi's ethical doctrines because two of his treatises that contain elements of a moral philosophy - *al-Tibb al-ruhani (The Spiritual Physick)* and *al-Sira al-falsafiyya (The Philosophical Life)* - have survived. On the one hand, al-Razi saw ethics as a kind of psychological medicine. The restoration of equilibrium following upon dislocation is the goal of spiritual or psychic healing, and preventing such disruptions is ethics. For him, pleasure is not a positive or cumulative affection but instead the result of a prior pain that was itself caused by a rupture or departure from the normal state and which thereafter ceases as the normal condition returns or is restored. Passion and appetites will occur naturally but they must be restrained by reason from growing to excess; they should be neither served nor encouraged. True virtue lies in satisfying every need only so far as is indispensable. Al-Razi was against all forms of asceticism, specifically those practised by Muslims. In comparison to the ascetic model of Socrates, contemporaries faulted him for leading a public existence, marrying and having children, earning a living and enjoying the company of princes. Al-Razi, however, vigorously denied that such asceticism was true of his ancient master; Socrates, he insisted, eventually did return to public life and thereafter avoided the extremes of his earlier position.

Equally al-Razi denied excesses of commission as well as abstinence. The merciful Lord, he said, does not approve the causing of pain and injustice; hence inflicting hurt either on oneself or on any other being is wrong unless necessary or inevitable. All must be in accord with nature and thus, on occasion, the greater good or benefit may require it. In this way al-Razi warned against the needless slaughter of animals (except in the case of wild, carnivorous creatures whose own extinction may spare their victims' death and also provide for the release of the beast's own soul).

On the other hand, al-Razi, in line with his emphasis on the controlling role of reason, believed that philosophy and the philosophic life yields the only salvation that is ultimately possible (see Salvation). Pursuit of that life is to imitate God in the way possible for humankind. The ultimate end for which humans were created does not comprise a physical existence but another world, one without death and pain. The human soul will achieve its hold on that world in proportion to the quality of its previous life while in the body. Those who practise justice and seek to acquire knowledge - that is, to lead the philosophical life - become habituated to reason, living free of the body and accustomed to unceasing joy. Upon death this will be their permanent state. In contrast, those who cling to a physical existence will, as Plato said, fail to depart this world of generation and corruption and will therefore continue to suffer pain and unending distress.

al-Razi, Fakhr al-Din (1149-1209)

Imam Fakhr al-Din al-Razi was one of the outstanding figures in Islamic theology. Living in the second half of the sixth century AH *(twelfth century* AD*), he also wrote on history, grammar, rhetoric, literature, law, the natural sciences and philosophy, and composed one of the major works of Qur'anic exegesis, the only remarkable gap in his output being politics. He travelled widely in the eastern lands of Islam, often engaging in heated polemical confrontations. His disputatious character, intolerant of intellectual weakness, frequently surfaces in his writings, but these are also marked by a spirit of synthesis and a profound desire to uncover the truth, whatever its source. A number of his metaphysical positions became well known in subsequent philosophical literature, being cited more often than not for the purposes of refutation. His prolixity and pedantic argumentation were often criticized, but he was widely considered the reviver of Islam in his century.*

1 Theology and philosophy

Fakhr al-Din al-Razi was born in Rayy near present-day Tehran in AH 543 or 544/AD 1149-50. Like his predecessor al-Ghazali, he was an adherent of the Shafi'i school in law and of the theology of Ash'arism (see Ash'ariyya and Mu'tazila). He was attracted at an early age to the study of philosophy, in which he soon became proficient. In his late twenties, he visited Khwarazm and Transoxania, where he came in contact with some of the last theologians in the Mu'tazilite tradition. Although he endured hardship and poverty at the beginning of his career, on returning to Rayy from Transoxania he entered into the first of a series of patronage relations with rulers in the east which contributed to his reputedly considerable wealth and authority.

Al-Razi's skill in polemic ensured that controversy followed him in his subsequent sojourns in Khurasan, Bukhara, Samarqand and elsewhere (he is said to have visited India). He consequently made several dangerous enemies, including among them the Karramiyyah (an activist ascetic sect, staunch defenders of a literal interpretation of scripture and of anthropomorphism), the Isma'ilis, and the Hanbalites, each of whom apparently threatened his life at various points. Al-Razi settled finally in Herat, where he had a teaching *madrasa* built for him, and where he died in AH 606/AD 1209.

In the religious sciences, al-Ghazali had legitimized the use of logic, while at the same time attacking those key metaphysical doctrines of the philosophers which most offended against orthodox doctrine. This move prepared the ground for the subsequent incorporation of philosophical argumentation into theology. It was through al-Razi that this marriage was most completely effected in the Sunni world. His major theological works all begin with a section on metaphysics, and this was to become the pattern for most later writers.

The problem of how far al-Razi should be considered a philosopher (rather than a theologian) is complicated by changes of view during the course of his life, and by his highly disputatious and often intemperate personality, which he himself acknowledged. His style is marked by an extensively ramifying dialectic, often ending in highly artificial subtleties, and is not easy to follow. The relentlessness and sometimes obvious delight with which al-Razi used this method to home in on his victims earned him among philosophers the sobriquet of Iman al-Mushakkikin (Leader of the Doubters). Nevertheless, al-Razi was scrupulous in representing the views he set out to criticize, manifesting his concern to lay out a rigorous dialectic in which theological ideas could be debated before the arbitration of reason. This predictably brought him under subsequent attack from those who believed that upholding orthodox doctrine was the primary task of theology, one of whom remarked that in al-Razi's works 'the heresy is in cash, the refutation on credit'.

One of al-Razi's major concerns was the self-sufficiency of the intellect. His strongest statements show that he believed proofs based on Tradition (*hadith*) could never lead to certainty (*yaqin*) but only to presumption (*zann*), a key distinction in Islamic thought. On the other hand, his acknowledgement of the primacy of the Qur'an grew with his years. A detailed examination of al-Razi's rationalism has never been undertaken, but he undoubtedly holds an important place in the debate in the Islamic tradition on the harmonization of reason and revelation. In his later years he seems to have shown some interest in mysticism, although this never formed a significant part of his thought.

Al-Razi's most important philosophical writings were two works of his younger days, a commentary (*sharh*) on

the physics and metaphysics of Ibn Sina’s *Kitab al-isharat wa-’l-tanbihat (Remarks and Admonitions)* (see Ibn Sina) and another work on the same subject, *al-Mabahith al-mashriqiyya (Eastern Studies)*, which is based in large part on the latter’s *al-Shifa’* and *al-Najat* as well as *al-Isharat*, but in which al-Razi frequently preferred the views of Abu ‘l-Barakat al-Baghdadi (d. after AH 560/AD 1164-5). Also of great philosophical interest is his theological text *Muhassal al-afkar (The Harvest of Thought)*. Perhaps al-Razi’s greatest work, however, is the *Mafatih al-ghayb (The Keys to the Unknown)*, one of the most extensive commentaries on the Qur’an, running to eight volumes in quarto and known more popularly as simply *al-Tafsir al-kabir (The Great Commentary)*. As its more orthodox detractors have been happy to point out, this work, which occupied al-Razi to the end of his life and was completed by a pupil, contains much of philosophical interest.

The person who did the most to defend Ibn Sina, and philosophy in general, against the criticisms of al-Razi was Nasir al-Din al-Tusi, whose commentary on the *Kitab al-isharat* was in large measure a refutation of al-Razi’s opinions. Al-Tusi also wrote a *Talkhis al-muhassal al-afkar (Abridgement of the Muhassal al-afkar)*, where he likewise undertook a criticism of many of the philosophical criticisms in the *Muhassal al-afkar*.

2 Metaphysics

Al-Razi was associated by later authors with the view that existence is distinct from, and additional to, essence, both in the case of creation and in the case of God, and that pure existence is merely a concept (see Existence). This view is at variance with the Ash‘arite and Mu‘tazilite positions, as well as with that of Ibn Sina and his followers. Al-Razi only departed from this view in his commentary on the Qur’an, where he went back to a more traditional view that in God essence and existence are one.

Another challenge to the philosophers for which al-Razi achieved fame was his refutation of the emanationist principle *ex uno non fit nisi unum* (only one can come from one.) In Ibn Sina’s formulation, if an indivisible single thing were to give rise to two things, *a* and *b*, this would result in a contradiction, for the same single thing would be the source of both *a* and of not-*a* ($= b$). Al-Razi’s refutation was based on the claim that the contradictory of ‘the emanation of *a*’ is ‘the non-emanation of *a*’, not ‘the emanation of not-*a*’. On a related point, he originally denied the possibility of a vacuum, but in his *Mafatih* he argues for its existence, and for the power of the Almighty to fill it with an infinity of universes.

The philosophers, following Ibn Sina, held knowledge to be an inhering in the knower of the form of the thing known, and that consequently God knew only universals and not particulars, knowledge of the latter implying inadmissible changes in God’s essence as particulars changed (see Immutability). For the most part theologians were opposed to thus restricting God’s knowledge, on the grounds that he was omniscient (see Omniscience). Al-Razi upheld the theological side of the debate through postulating that knowledge involved a relation between the knower and the thing known, so that a change in the thing known would produce a change in the relation but not in the essence of the knower. This notion of a relation involved the substitution of a philosophical term, *idafa* (relation), for a theological one, *ta‘alluq* (connection), in an argument about the attribute of knowledge which belonged essentially to Abu ’l-Husayn al-Basri’s Mu‘tazilite school.

In ethics, al-Razi held that God alone, through revelation, determines moral values for man, it being these which give rise to praise and blame. God himself was beyond the moral realm and acted from no purpose extraneous to himself, be it out of pure goodness or for the benefit of his creation. Following al-Ghazali, and before him al-Juwayni, al-Razi’s solution to the problem posed for divine subjectivists by God’s threats of punishment and reward was to acknowledge a subjective rational capacity within man allowing him to understand what causes him pleasure and pain and thus enabling him to perceive where his advantage lies. In his *‘Ilm al-akhlaq (Science of Ethics)* al-Razi built upon al-Ghazali’s ethical writings, particularly from the *Ihya’ ‘ulum al-din*, providing a systematic framework based on psychology, again under the influence of al-Baghdadi (see Ethics in Islamic philosophy).

On the question of free will, al-Razi took a radical determinist position and rejected outright the Ash‘arite doctrine of *kasb* (acquisition). Al-Razi postulated two factors necessary for the production of an action: the power to do it or not to do it, and a preponderating factor, the motivation, which leads to the action being performed or not. Once the preponderating factor exists together with the power, either the act comes about necessarily or else it becomes impossible. Al-Razi pushed this essentially Mu‘tazilite thesis, which is also similar to Ibn Sina’s thinking, to its

logical conclusion, arguing that both the power and the preponderating factor had to be created by God for the result to exist necessarily, and hence that all human actions have been produced through God's determination. We thus appear to be free agents because we act according to our motives, but in reality we are constrained. A consequence of this theory when it is applied to God's own acts is that since God acts through his power, he must himself either act through constraint (if there is a preponderating factor in this case) or else by chance (if there is not), both of which conclusions violate the central Sunnite position that God is a totally free agent. Those who came after al-Razi felt that he had never adequately solved this difficulty, and he himself confessed that, whether from the point of view of reason or of tradition, there was in the end no satisfactory solution to the free will problem (see Free will).

Al-Razi held the Ash'arite position that God could re-create what had been made inexistent, and this formed the basis of his literal understanding of bodily resurrection. However, he also expressed views which were influenced by the theory of the late Mu'tazili Ibn al-Malahimi, who held the contrary position on the restoration of non-existence, that the world did not pass into non-existence but its parts were dissociated, and that the essential of these parts were reassembled on the resurrection. This ambivalence on al-Razi's part perhaps reflects the changes in his position on atomism, which he vehemently denied in his earlier purely philosophical works but of which he was more supportive towards the end of his life.

List of works

al-Razi, Fakhr al-Din (before 1185) *al-Mabahith al-mashriqiyya fi 'ilm al-ilahiyyat wa-'l-tabi'iyyat (Eastern Studies in Metaphysics and Physics)*, Hyderabad: Da'irat al-Ma'arif al-Nizamiyyah, 1923-4, 2 vols; repr. Tehran, 1966.(One of al-Razi's most important philosophical texts.)

al-Razi, Fakhr al-Din (before 1239) *al-Tafsir al-kabir (The Great Commentary)*, Cairo: al-Matba'ah al Bahiyyah al-Misriyyah, 1938, 32 vols in 16; several reprints.(Al-Razi's commentary on the Qur'an, completed by his pupil al-Khuwayyi; useful in many places as in indication of his later philosophical positions.)

al-Razi, Fakhr al-Din (before 1209) *Muhassal afkar al-mutaqaddimin wa-'l-muta'akhkhirin min al-'ulama' wa-'l-hukama' wa-'l-mutakallimin (The Harvest of the Thought of the Ancients and Moderns)*, Cairo: al-Matba'ah al Bahiyyah al-Misriyyah, 1905.(Printed with al-Tusi's *Talkhis al-Muhassal* at the bottom of the page and al-Razi's *al-Ma'alim fi usul al-din (The Waymarks and Principles of Religion)* in the margin.)

al-Razi, Fakhr al-Din (before 1209) *Kitab al-nafs wa-'l-ruh wa sharh quwa-huma (Book on the Soul and the Spirit and their Faculties)*, ed. M.S.H. al-Ma'sumi, Islamabad: Islamic Research Institute, 1968; trans. M.S.H. al-Ma'sumi, *Imam Razi's 'Ilm al-akhlaq*, Islamabad: Islamic Research Institute, 1969.(Al-Razi's work on ethics.)

al-Razi, Fakhr al-Din (before 1209) *Sharh al-Isharat (Commentary on the Isharat)*.(No critical edition of al-Razi's commentary on Ibn Sina's Kitab al-isharat has appeared. Portions can be found in S. Dunya (ed.) *al-Isharat wa-'l-tanbihat*, Cairo: Dar al-Ma'arif, 1957-60, 4 parts, 3 vols in 2; also in *al-Isharat wa-'l-tanbihat*, Tehran: Matba'at al-Haydari, 1957-9, 3 vols. Both these editions contain al-Tusi's commentary as well as parts of Fakhr al-Din al-Razi's commentary, to which al-Tusi is responding. The Tehran edition also contains Qutb al-Din al-Razi's commentary, which set out to adjudicate between al-Tusi and al-Razi.)

al-Razi, Fakhr al-Din (before 1209) *Lubab al-Isharat (The Pith of the Isharat)*, ed. M. Shihabi in *al-Tanbihat wa-'l isharat*, Tehran: Tehran University Press, 1960; ed. A. 'Atiyah, Cairo: Maktabat al-Kharji, 1936/7. (Al-Razi's epitome of Ibn Sina's work, written after he had completed his commentary.)

Mahdi's response in the same volume (297-303) on the general question of al-Razi as philosopher.)

al-Sabzawari, al-Hajj Mulla Hadi (1797/8-1873)

*Al-Sabzawari was the most influential nineteenth-century Iranian philosopher. His reputation rests in part on his Sharh al-manzuma, a commentary on his own Ghurar al-fara'id (The Blazes of the Gems), a didactic poem (*manzuma*) encapsulating in a systematic fashion an exposition of the existentialist philosophy of Mulla Sadra. He was also the most sought-after teacher of philosophy in his day, and many students travelled to Sabzavar to be taught by him. Famous for his saintliness as well as his erudition, he set the tone for much of twentieth-century Iranian philosophy.*

Al-Hajj Mulla Hadi al-Sabzawari, the most famous of the philosophers of the Qajar period in Iran, was born in AH 1212/AD 1797-8 in Sabzavar in northeastern Iran. He studied logic, mathematics, law and metaphysics in Mashhad, where he moved at the age of ten after completing his preliminary education in Sabzavar. He pursued his interests in philosophy by moving to Isfahan to study for seven years with, among others, Mulla 'Ali Nuri (d. AH 1246/AD 1830-1), the foremost interpreter of his day of the philosophy of Mulla Sadra. He returned to Mashhad to teach for five years, and then accomplished the pilgrimage to Mecca (*hajj*). On his way back from pilgrimage he spent a year in Kirman, where he married, before returning to Sabzavar where he spent the rest of his life devoted to teaching and writing. A remarkable number of students of philosophy came to study with him, not only from Iran but from Arab countries and India as well. So great was his reputation that Nasir al-Din Shah, for whom he wrote his *Asrar al-hikam (Secrets of the Wisdoms)*, came to visit him in AH 1284/AD 1867, but al-Sabzawari's pious and ascetic way of life (several minor miracles are attributed to him), led him to refuse direct royal patronage. He died in AH 1289/AD 1873, having turned Mulla Sadra's legacy into the predominant philosophical school of the nineteenth and twentieth centuries.

Al-Sabzawari's fame rests primarily on one work, his *Ghurar al-fara'id (The Blazes of the Gems)*, a poem in which he gives a systematic and complete presentation of the philosophy of the school of Mulla Sadra, together with the *Sharh al-manzuma*, his own commentary on this poem, which he composed despairing of the philosophical ignorance of his contemporaries. The merit of this work lies not so much in any radically new theories, but in its plan and organization, which have made it the standard text for students of philosophy in Shi'i *madrasa*s until the present day. The situation is now changing and new teaching texts are appearing, but most of these are still influenced by the *Sharh al-manzuma* in both structure and content.

In the centuries after Mulla Sadra, philosophers were on the whole inclined to write on specific topics, thus leaving a gap in so far as there was no text that treated the whole of post-Sadrian philosophy in a systematic and assimilable fashion to which students could turn. Al-Sabzawari filled this gap, first with his didactic poem, which was to be memorized, and second with his commentary, which elaborates the poem in the manner of a traditional teacher in the Islamic religious sciences. The completeness of the work can be gauged by its contents, which give a good idea of what subjects philosophy encompasses for the contemporary religious student in a Shi'i *madrasa*.

The first part is on logic, with the commentary separately subtitled *al-La'ali al-muntazima (The Well-Ordered Nights)*. The second part (with commentary subtitled *Ghurar al-fara'id*), is divided into seven sections: (1) general principles (*al-umur al-'amma*), covering existence and related matters (unity, systematic ambiguity, modality, actuality and so on), quiddity and causality; (2) substance and accident; (3) metaphysical theology (*al-ilahiyyat bi-'l-ma'na al-akhass*), God's essence, attributes and acts; (4) natural philosophy, including discussions of matter and motion and a section on psychology; (5) certain supernatural phenomena, including dreams, miracles and prophecy; (6) the resurrection (*ma'ad*); and (7) ethics (*akhlaq*), with a brief treatment of spiritual values. It should be noted that (2) is essentially part of (1), that (1-4) form the core of the work, and that (5-7) are relatively short sections.

The commentary is amply provided with proofs and arguments, but there is also a marked emphasis on intuitive and mystical perception. This aspect of al-Sabzawari's thought is even more evident in his other works, which included commentaries on two of the key supplications in Shi'i devotional literature and the above-mentioned *Asrar al-hikam*, in Persian, in which eschatology is elucidated through metaphysical theology, psychology, ethics and the law (*shari'a*). This latter work is threaded through with poetic quotations. Al-Sabzawari was not only a poet in his own right (he has a Persian *diwan*, or collection of poems), but he also produced an elaborate

metaphysical commentary on passages from Jalal al-Din al-Rumi's *Mathnavi* which amply reflects his own spiritual preoccupations.

Because of the elegance of his exposition of the entire scope of the Sadrian philosophy of his time, al-Sabzawari has attracted the attention of a number of modern scholars who, under the influence of his manifestly esoteric outlook, have tended to emphasize the mystical approach in nineteenth-century Iranian philosophy. Although this influence has tended to obscure other philosophical currents of the time and their legacy to twentieth-century Iranian philosophy, it cannot be denied that al-Sabzawari was the most significant philosopher of this period and the one who, through the large number of his students, exerted the most powerful effect on later generations.

JOHN COOPER

List of works

In addition to the works listed below, al-Sabzawari wrote glosses on several works by Mulla Sadra. Those on the *Asfar* can be found in the footnotes of the printed edition of that work (see Mulla Sadra).

al-Sabzawari (1826-45) *Sharh al-manzuma* (commentary on the didactic poem (*manzuma*), the *Ghurar al-fara'id*), ed. H.H. al-Amuli and M. Talibi, Tehran: Nab, 1995, 3 vols; *Sharh-i manzuma*, lithograph editions in Arabic.(This edition is so far incomplete. The only complete text is provided by numerous printings of the lithographed texts, the most common being the so-called 'Nasiri' lithograph. In the published edition, Volume 1 contains the logic, *al-La'ali al-muntazima*; Volume 2 is sections 1 and 2 of the metaphysics of the *Ghurar al-fara'id*; Volume 3 contains the remainder of the metaphysics. The text is in Arabic with glosses by H.H. al-Amuli, but there is an English introduction to Volume 3. An earlier Arabic edition of the metaphysics is *Sharh ghurar al-fara'id*, ed. M. Mohaghegh and T. Izutsu, Tehran: McGill University Institute of Islamic Studies, Tehran Branch, 1969. This edition also contains extracts from the commentaries of Muhammad Taqi Amuli and Akhund-e Hidaji, and has a useful Arabic-English glossary of al-Sabzawari's philosophical terminology.)

al-Sabzawari (1867-70) *Asrar al-hikam (Secrets of the Wisdoms)*, ed. H.M. Farzad, Tehran: Intisharat-e Mawla, 1982.(Arabic text, not a critical edition.)

al-Sijistani, Abu Sulayman Muhammad (*c.*932-*c.*1000)

Al-Sijistani was one of the great figures of Baghdad in the fourth century AH (tenth century AD). He assembled around him a circle of philosophers and litterateurs who met regularly in sessions to discuss topics related to philosophy, religion and language. As a philosopher with a humanistic orientation, his concerns went beyond subjects of strictly philosophical nature. His philosophical ideas displayed Aristotelian and Neoplatonic motifs. He considered philosophy and religion to be totally different in nature and method, so that the two could not be reconciled. God is only prior to the world in essence, rank and nobility, not in time. Al-Sijistani insisted that in no way should one attribute to God the imperfections of created things. According to him, the soul is simple by nature and natural reason is capable of attaining a state of pure knowledge that enables one to distinguish between good and evil. Reason, if taken as a guide, could ensure happiness.

1 Life and works

Abu Sulayman Muhammad al-Sijistani, known as al-Mantiqi (the Logician), was born, *c.*AH 320/AD 932. His formative years were spent in Sijistan (now Sistan in Iran) but the mature phase of his career took place in Baghdad. He became one of the great figures of the Islamic humanist movement that flourished during the fourth century AH (tenth century AD) in Baghdad. He dominated his generation by the enlightenment of his judgments and the breadth of his knowledge. He was especially interested in ancient philosophy and its transmission into the world of Islam. He assembled around him a circle of friends, philosophers, scientists and litterateurs of various ethnic and religious affiliations. The circle met in regular sessions (*majalis*) and with open and critical minds discussed topics related to philosophy, religion, science and language. Al-Sijistani died *c.*AH 391/AD 1000.

Those of al-Sijsitani's works that have reached us are not numerous. One of the most important attributed to him is *Siwan al-hikma (Vessel of Wisdom)*, from which only selections have survived. The attribution to al-Sijistani of this collection of dicta and anecdotes of Greek and Islamic philosophers has been challenged by W. al-Qadi (1981), but Joel Kraemer (1986) believes that the work emanated from al-Sijistani's school, based upon classroom notes and texts. In addition to *Siwan al-hikma*, al-Sijistani wrote short treatises on the first mover, the fifth nature of the celestial spheres, the perfection peculiar to the human species, principles of being, dream omens and logic.

In a Socratic fashion, al-Sijistani preferred oral instruction over writing. We owe to his student and protégé Abu Hayyan al-Tawhidi most of the information concerning his philosophical ideas and doctrines. Al-Tawhidi recorded the sessions of al-Sijistani's circle in his works *al-Muqabasat (Conversations)* and *al-Imta' wa-al-mu'anasa (Book of Pleasure and Conviviality)*, which remain the major sources of information on the life and thought of al-Sijistani. Consequently we have to look at his teachings through the window of his pupil's writings.

2 Doctrines

As a philosopher with a humanistic orientation, al-Sijistani's concerns went beyond subjects of strictly philosophical nature. His philosophical ideas displayed Aristotelian and Neoplatonic motifs and touched on a wide range of subjects such as politics, aesthetics and friendship, among others. However, his chief preoccupation, and that of the circle members as reflected in al-Tawhidi's recordings, centred on the relations between philosophy and religion, the mind-body problem - why the soul was susceptible to virtues and vices, good and evil - the question of God's relation with and action in the universe, and finally the individual and society.

Al-Tawhidi represents his mentor as a man of deep religious sentiments but who regarded both religion and philosophy as true and valid. The two are independent and should not and cannot be reconciled. They differ in method and substance. In religion there are things which cannot be fathomed or understood but are to be accepted and assented to; the end of religion is proximity to God, whereas the aim of philosophy is contemplation. Al-Sijistani objected to the attempt by the Brethren of Purity to harmonize religion and philosophy, and lashed out at the Islamic theologians (*al-mutakallimun*) who claimed that their methodology was rationalist when in reality it was false rationalism (see Ikhwan al-safa'; Islamic theology).

For al-Sijistani the universe is divided into the terrestrial and the intelligible according to the Platonic system, but God acts in accordance with the Aristotelian concept of first mover. Having accepted the view that matter is eternal, he held that this does not detract from the perfection of God since in the final analysis everything depends

on his will. One should not attribute to God the imperfections of the created world. God is prior to the world in essence, rank and nobility, but not in time.

Knowledge implies two types: natural and supernatural. There are four degrees of knowledge: sensible knowledge possessed by non-reasoning animals; absolutely and exclusively intelligible knowledge possessed by the celestial bodies; the sensible-intelligible knowledge tied up with the imagination of those who have not reached perfect purity; and the intelligible-sensible knowledge which has been arrived at through rational and speculative investigation. This is the highest knowledge humans, including such persons as philosophers, augurs (*kahins*) and prophets, can acquire. Intuition, however, is the noblest kind of knowledge because it presents itself by itself in the soul and is not subject to generation and corruption. Through reason we overcome all obstacles to reach God through the intellect, which is the medium between human beings and the supernatural world. Reason has the power to contact the super-sensible beings until it reaches the First Being.

Having been greatly interested in the body-soul relationship, al-Sijistani distinguished between soul (*nafs*) and spirit (*ruh*), considering the soul to be a simple substance imperceptible to the senses and not subject to change or corruption. According to him, human beings are so by virtue of having a soul and not by the possession of a body, although the soul cannot make a human being by itself. The soul is the principle of knowledge, the body the principle of action. Because of the rival elements, nature versus reason, that constitute a human being and pull him in opposite directions, it is important to take reason as a guide. It alone can ensure our ultimate happiness, namely the knowledge of God and the good which he has reserved for the virtuous. One should aim high towards the celestial world in order to reach eternal life (see Soul in Islamic philosophy).

al-Suhrawardi, Shihab al-Din Yahya (1154-91)

Al-Suhrawardi, whose life spanned a period of less than forty years in the middle of the twelfth century AD, *produced a series of highly assured works which established him as the founder of a new school of philosophy in the Muslim world, the school of Illuminationist philosophy (*hikmat al-ishraq*). Although arising out of the peripatetic philosophy developed by Ibn Sina, al-Suhrawardi's Illuminationist philosophy is critical of several of the positions taken by Ibn Sina, and radically departs from the latter through the creation of a symbolic language to give expression to his metaphysics and cosmology, his 'science of lights'. The fundamental constituent of reality for al-Suhrawardi is pure, immaterial light, than which nothing is more manifest, and which unfolds from the Light of Lights in emanationist fashion through a descending order of lights of ever diminishing intensity; through complex interactions, these in turn give rise to horizontal arrays of lights, similar in concept to the Platonic Forms, which govern the species of mundane reality. Al-Suhrawardi also elaborated the idea of an independent, intermediary world, the imaginal world (*alam al-mithal*). His views have exerted a powerful influence down to this day, particularly through Mulla Sadra's adaptation of his concept of intensity and gradation to existence, wherein he combined Peripatetic and Illuminationist descriptions of reality.*

1 Al-Suhrawardi and the philosophy of *ishraq*

Shihab al-Din Yahya ibn Habash ibn Amirak Abu 'l-Futuh al-Suhrawardi, known as al-Maqtul (the Slain) in reference to his execution, and usually referred to as Shaykh al-Ishraq after the Illuminationist philosophy (*hikmat al-ishraq*) which he espoused, was born in AH 549/AD 1154 in the village of Suhraward in northwest Iran. After studying in Maraghah (with Majd al-Din al-Jili, who also taught Fakhr al-Din Al-Razi) and Isfahan, he passed several years in southwest Anatolia, associating with Seljuq rulers and princes, before moving to Aleppo in AH 579/AD 1183. Here he taught and became a friend of the governor, al-Malik al-Zahir al-Ghazi (son of the Ayyubid Salah al-Din, famous in European literature as Saladin), who later also befriended Ibn al-'Arabi. However, he fell foul of the religious authorities, and was executed in AH 587/AD 1191 on the orders of Salah al-Din, in circumstances which remain unclear but which involved charges of corrupting the religion and allegations of claims to prophecy, and may also have had a political dimension.

Al-Suhrawardi clearly intended his philosophy to make a distinctive break with the previous peripatetic tradition of Ibn Sina, but the significance of this break has been interpreted in a number of ways. For subsequent Islamic philosophy, he was above all the conceiver and main proponent of the theory of the primacy of quiddity. While the predominant trend in Western scholarship has been to depict him as the originator of a distinctive mystical and esoteric philosophy, recent Western scholarship has emphasized his critique of peripatetic logic and epistemology and his own theories in these fields (see for example Ziai 1990).

Ibn Sina famously tackled the question of mystical knowledge in the last section of his *Kitab al-Isharat wa-'l-tanbihat (Remarks and Admonitions)*, thus assuring a place for this area of knowledge within the domain of *hikma* (wisdom). It was al-Suhrawardi, however, who turned mystical and intuitive knowledge into a paradigm of knowledge in general. This epistemology then served as a basis on which to construct both a critique of peripatetic philosophy and an original philosophy of lights, or Illumination (*ishraq*). Yet, however important it was for al-Suhrawardi to stress his radical departure from peripatetic philosophy, he also emphasized the necessity for those who would follow his method to study the peripatetic method closely.

Al-Suhrawardi's writings fall into several categories. First, there are his four major philosophical works, written in Arabic: *Kitab al-talwihat (The Intimations)*, *Kitab al-muqawamat (The Oppositions)*, *Kitab al-mashari' wa-'l-mutarahat (The Paths and Heavens)* and *Kitab hikmat al-ishraq (The Philosophy of Illumination)*. These were apparently intended by al-Suhrawardi to be studied in this order, and roughly follow a progression from a more or less conventionally peripatetic style to one in which the 'science of lights' is expressed through its own technical vocabulary and method, a progression described by al-Suhrawardi as a movement from a discursive philosophy (*hikma bahthiyya*) to an intuitive philosophy (*hikma dhawqiyya*). The second group of works contains a set of symbolic narratives, mostly in Persian but a few in Arabic, expounding the journey of the soul through the stages of self-realization and offering striking images of some of the notions of Illuminationism while seeking to cultivate the kind of intuitive vision at its heart. The remaining works consist of a number of shorter treatises in

Arabic, such as the *Hayakil al-nur (The Temples of Light)*, and others in Persian expounding Illuminationist philosophy in a simpler form, a collection of prayers and invocations, and some miscellaneous translations (or versions) and commentaries.

2 Epistemology

By basing his philosophy on light, al-Suhrawardi was able to introduce two important notions which may be thought of as the seeds of the entire system: that of intensity and gradation, and that of presence and self-manifestation. It is possible to see his philosophy as experiential, although his notion of experience was not confined to that obtained through the senses but embraced other forms including that of mystical experience. Ibn Sina's explanation of knowledge is based on the inhering of the form of the thing known in the mind of the knower, but for al-Suhrawardi such knowledge only guarantees certainty and the correspondence of knowledge with reality, because there exists a more fundamental kind of knowledge that does not depend on form and which is, like the experience of pain, unmediated and undeniable. The prime mode of this presential knowledge (*al-'ilm al-huduri*) is self-awareness, and every being existing in itself which is capable of self-awareness is a pure and simple light, as evinced by the pellucid clarity with which it is manifest to itself. In fact, being a pure and simple light is precisely the same as having self-awareness, and this is true of all self-aware entities up to and including God, the Light of Lights, the intensity of whose illumination and self-awareness encompasses everything else. The main constituent of reality is the hierarchies of such pure lights, differing solely in the intensity of their Illumination, and thus of self-awareness (see Illuminationist philosophy).

How then is the philosopher to realize this self-awareness? The prospective Illuminationist must engage in a variety of recommended ascetic practices (including forty-day retreats and abstaining from meat) to detach himself from the darknesses of this world and prepare himself for the experiences of the world of lights. The heightened pleasure afforded by this latter kind of experience is emphasized. Having spiritually purified himself, the philosopher is ready to receive the Divine Light and is rewarded with visions of 'apocalyptic' lights which form the basis for real knowledge. At this point the Illuminationist must employ discursive philosophy to analyse the experience and systematize it, in the same way as with sensory experience.

The relation between this direct intuitive knowledge and the philosophy of Illumination is compared to that between observation of the heavens and astronomy. The major portion of al-Suhrawardi's writings is devoted to this last stage of rational analysis and systematization, although he sometimes relates his visions. His symbolic narratives in Persian are in some sense a record of these, although in them al-Suhrawardi, the author, is never explicitly the first person. The narratives have a pedagogic function, and are guides to the kind of experiences to be encountered by the seeker and to their interpretation; indeed a central figure in these narratives is often a guide, the lord of the human species, sometimes though not exclusively identified as Gabriel.

3 Logic, physics, metaphysics and cosmology

The unfolding of reality in Illuminationism is governed by the different ways in which the pure lights interact to produce further levels of lights and darknesses, and by the subsequent interaction of all these different levels with each other, resulting eventually in a densely populated universe. The pure lights are the causes of three other categories of entities: accidental lights (actual physical light, and certain accidents of intellects and souls), dark modes (accidental categories in bodies excluding accidental lights) and intermediary isthmuses (*barzakhs*) or boundaries (bodies). The luminous properties of these degrees are also properties of self-awareness; thus for example, an accidental light subsists in something other than itself, and is also in need of something else to be aware of itself.

Existence as such does not perform much more than an explanatory role in Illuminationism, quite different from the central position it occupied in peripatetic philosophy, a major question for which was the nature of the relationship between existence and quiddity. However, it is important to notice that light does not merely act as a substitute for existence: existence, and its explanatory function, is rendered totally redundant. The lights (and darknesses and *barzakhs* caused by lights) in al-Suhrawardi's system are discrete entities whose interactions in turn bring about other lights. There is thus a primacy of the entity, and al-Suhrawardi regards existence as such to be no more than a mental abstraction having no external reality. Furthermore, although lights differ in intensity, there is nothing in this system to correspond with Ibn al-'Arabi's *wahdat al-wujud* (unity of being) (see Ibn

al-‘Arabi); al-Suhrawardi would not have said that all reality is light, but that it is lights. It is for these reasons that he was subsequently held responsible for the idea of the primacy of quiddity (*asalat al-mahiya*), although he did not use this expression himself. It was Mulla Sadra who, four centuries later, built upon the insight that reality was in effect a continuum of graded intensities, but a continuum of existence, not of light. He was thus able to fuse al-Suhrawardi’s system with those of the peripatetics and Ibn al- ‘Arabi into a metaphysical theory in which reality was nothing more than existence itself, and to turn quiddity into the purely mental abstraction which existence was for al-Suhrawardi.

His insight concerning presential knowledge (which al-Suhrawardi himself declared was vouchsafed to him by Aristotle in a dream) suggested solutions to weaknesses which al-Suhrawardi had detected in Ibn Sina’s philosophical system. The most important of these concerned the theory of definition, and the problem of definition as the basis of scientific knowledge. First, he objects that it is impossible to give a complete definition, for a complete definition should contain all the constituents of the definiendum, and such an enumeration is impossible. Second, the peripatetics held that definition is a means of proceeding from the known to the unknown; but the essential constituents, al-Suhrawardi asserts, are just as unknown as the definiendum, so this cannot be so. Contained within this is also an objection against induction: how can one know if the collection of essential elements of a thing is complete merely by enumerating them? His conclusion is that prior knowledge is always necessary and presupposed.

Another area of disagreement with peripatetic philosophy was the categories, which were treated by al-Suhrawardi not in his logic, but in his physics. He reduces the accidental categories to four (quality, quantity, relation and motion), and holds intensity to be a property of substances as well as of accidents. With change in intensity, there is no change in the essence of an accident (a colour, for example) or a substance (such as cause and effect); the only difference is the degree of perfection.

As is to be expected, al-Suhrawardi’s physics also contained a new theory of vision. He not only rejected the idea that the forms of objects were imprinted in the eye, but also the other current theory that light was emitted from the eye and fell onto the object. Vision is only possible, according to al-Suhrawardi, when the soul is illuminated by the light, substantial or accidental, of the object, and thus he brings vision within the compass of his illuminative theory of knowledge.

The physical or elemental world as depicted by al-Suhrawardi rejects the peripatetic division of matter and form, and substitutes for it a world of bodies composed of varying mixtures of light and darkness, which permit the passage of light to different degrees. Above the physical world the lights are arranged in a vertical array, corresponding to the emanationist scheme of Ibn Sina. However, these pure, immaterial lights are not restricted to ten as are the intellects of the peripatetic scheme. Al-Suhrawardi says only that they are limited to the number of stars in the fixed heavens; thus they are indefinite in number, but not infinite. Moreover, these vertically arrayed ‘triumphal’ (*qahira*) lights interact with each other to produce a horizontal array of similarly immaterial, ‘regent’ (*mudabbira*) lights. Each of these horizontally arrayed lights is the lord of a species, analogous to the Platonic Forms, but with the important difference that they are lights which ‘govern’ the species under them rather than universals. The species are depicted as ‘idols’ (*asnam*) of their archetypes. It is the interactions of both the vertical and the horizontal lights which give rise to the bodies of the lower world, which are also classified into degrees depending on the extent to which they receive and transmit light, each being a boundary (*barzakh*) between light and darkness. Al-Suhrawardi also elaborated the idea of the immaterial imaginal world (*‘alam al-mithal*), situated between the physical world and the world of the lords of species. This is the locus for the kinds of veridical experiences recounted in his symbolic narratives, an unmediated account of which can only be given in this way and not through discursive reason. Al-Suhrawardi’s cosmology is a good deal more complicated than this survey has suggested, employing a detailed terminology for the divisions of lights which classifies them in a variety of different ways.

4 The language of *ishraq*

The integrity of al-Suhrawardi’s complex philosophy is achieved in no small measure by the elegance and refinement of his means of expression. His original Illuminationist vocabulary - the Islamic roots of which are sometimes overlooked - is one aspect of this. Al-Ghazali had set a precedent with his *Mishkat al-anwar (The Niche of the Lights)*, which commented on the Light verse in the Qur’an (24: 35). However, al-Suhrawardi also uses a

number of other devices to stretch the reader's conceptual boundaries and to convey further dimensions of his total vision of reality. All the lights are related to each other in a downward sense by their being 'triumphal' or 'exalted', but cohesion is further maintained by the 'desire' or 'love' which the lower degrees feel for the upper, and by the explanation which this affords of such things as the joy we experience in the presence of the sun and our fear in the presence of darkness, and the delight which we take in certain minerals such as gold and rubies.

Al-Suhrawardi also chose to describe the horizontal lights as angels, using names of the *Anshaspands* of Zoroastrian mythology to denote them (Khordad, Murdad, Urdibihisht and so on), and he taps the vocabulary of Pahlawi for further terms. In various places in his works he also traces a genealogy for the transmission of illuminationist wisdom which goes back simultaneously through a Greek/Western line (including Pythagoras and Plato) and an Iranian/Eastern line including Zoroaster (see Zoroastrianism) to Hermes Trismegistus, and asserts that there have been illuminationists (*ishraqiyyun*) throughout time. All of this raises the question of precedents for, and influences on, al-Suhrawardi's thought, a subject which has caused some controversy in the Western literature on this subject. It is not necessary to go into the details of Corbin's largely phenomenological argument for the existence of a Persian *ishraqi* philosophical tradition independent from the peripatetic (Corbin 1971); it is sufficient to point out the paucity of historical evidence for such a thesis, and indeed the paucity of textual evidence for any specific conclusions about influences on al-Suhrawardi. The more economical approach is to regard his use of ancient Persian mythology and his genealogy as a means of expressing his overwhelming conviction that he had restored the original foundation of philosophy in the certainty of intuitive experience, a foundation which he believed had been undermined by the excessive discursiveness of such philosophers as Ibn Sina. He saw the traces of this foundation in the writings of Plato and Aristotle (who in the Islamic tradition was also the author of the famous *Theology*), in the remnants of the Zoroastrian religion which he encountered, and in the utterances and writings attributed to certain Sufis.

The influence of al-Suhrawardi on Mulla Sadra has been mentioned above, but there is in addition a long and lively tradition of commentaries on several of his texts. In the philosophical tradition which continued after the Mongol period in Iran and further east in India, al-Suhrawardi stands second only to Ibn Sina. Perhaps the greatest testimony to his lasting importance is the fact that to this day in Iran philosophers are still informally classified as either *mashsha'i* (peripatetic) or *ishraqi*, depending on their leaning towards rationality or mysticism.

JOHN COOPER

List of works

al-Suhrawardi [Sohravardi, Shihaboddin Yahya] (1180?-91) *Œuvres philosophiques et mystiques*, vol. I: *La métaphysique: I. Kitab al-talwihat. 2. Kitab al-moqawamat. 3. Kitab al-mashari' wa'l-motarahat*, Arabic texts edited with introduction in French by H. Corbin, Tehran: Imperial Iranian Academy of Philosophy, and Paris: Adrien Maisonneuve, 1976; vol II: *I. Le Livre de la Théosophie oriental (Kitab Hikmat al-ishraq). 2. Le Symbole de foi des philosophes. 3. Le Récit de l'Exil occidental*, Arabic texts edited with introduction in French by H. Corbin, Tehran: Imperial Iranian Academy of Philosophy, and Paris: Adrien Maisonneuve, 1977; vol III: *Œuvres en persan*, Persian texts edited with introduction in Persian by S.H. Nasr, introduction in French by H. Corbin, Tehran: Imperial Iranian Academy of Philosophy, and Paris: Adrien Maisonneuve, 1977.(Only the metaphysics of the three texts in Vol. I were published. Vol. III contains a Persian version of the *Hayakil al-nur*, ed. and trans. H. Corbin, *L'Archange empourpré: quinze traités et récits mystiques*, Paris: Fayard, 1976, contains translations of most of the texts in vol. III of *Œuvres philosophiques et mystiques*, plus four others. Corbin provides introductions to each treatise, and includes several extracts from commentaries on the texts. W.M. Thackston, Jr, *The mystical and visionary treatises of Shihabuddin Yahya Suhrawardi*, London: Octagon Press, 1982, provides an English translation of most of the treatises in vol. III of *Œuvres philosophiques et mystiques*, which eschews all but the most basic annotation; it is therefore less useful than Corbin's translation from a philosophical point of view.)

al-Suhrawardi [Sohravardi, Shihaboddin Yahya] (1154-91) *Hayakil al-nur (The Temples of Light)*, ed. M.A. Abu Rayyan, Cairo: al-Maktaba al-Tijariyyah al-Kubra, 1957.(The Persian version appears in *Œuvres* vol. III.)

al-Suhrawardi [Sohravardi, Shihaboddin Yahya] (1180?-91) *Mantiq al-talwihat*, ed. A.A. Fayyaz, Tehran: Tehran University Press, 1955.(The logic of the *Kitab al-talwihat (The Intimations)*.)

al-Suhrawardi [Sohravardi, Shihaboddin Yahya] (1186-91) *Kitab hikmat al-ishraq (The Philosophy of Illumination)*, trans H. Corbin, ed. and intro. C. Jambet, *Le livre de la sagesse orientale: Kitab Hikmat al-Ishraq*, Lagrasse: Verdier, 1986.(Corbin's translation of the Prologue and the Second Part (The Divine Lights), together with the introduction of Shams al-Din al-Shahrazuri and liberal extracts from the commentaries of Qutb al-Din al-Shirazi and Mulla Sadra. Published after Corbin's death, this copiously annotated translation gives to the reader without Arabic immediate access to al-Suhrawardi's illuminationist method and language.)

al-Tawhidi, Abu Hayyan (*c.*930-1023)

Al-Tawhidi was an Arabic litterateur and philosopher, probably of Persian origin, and author of numerous books which reflect all the main themes of debate and reflection in the cultivated circles of his time. His basic outlook could be defined as a kind of simplified and vulgarized Neoplatonism, influenced by Gnostic elements, with four hypostases: God, Intellect, Soul and Nature. He also has a strong interest in moral questions on both the individual and social level.

‘Ali ibn Muhammad Abu Hayyan al-Tawhidi was probably of Persian origin. However, Arabic is the only language he is known to have used, and most of his life was spent in Baghdad and in Rayy (Tehran) at the court of the Buyid princes and their ministers, in particular the famous Ibn Sa‘dan. It is in the latter’s presence that the discussions recorded in *al-Imta‘ wa’-mu’anasa (Enjoyment and Conviviality)* took place. His last years were spent in Shiraz, where he died in AH 414/AD 1023.

Al-Tawhidi is a representative of Arabic belles-lettres (*adab*) rather than a philosopher in the strict sense. However, some of his main works report discussions devoted to philosophical themes and shed interesting sidelights on questions dealt with in a more systematic fashion by the great Arab philosophers. It goes with the genre adopted by al-Tawhidi that he rarely expresses his own opinions; his main authority is his master, Abu Sulayman al-Sijistani. He also appears to make extensive use of the *Rasa’il Ikhwan al-Safa’ (Epistles of the Brethren of Purity)*, although their name is rarely cited (see Ikhwan al-Safa’). Another source of inspiration is the ethical thinker Ibn Miskawayh, with whom he exchanged a philosophical correspondence, *al-Hawamil wal-shawamil (Rambling and Comprehensive Questions)*. Among Greek philosophers, Aristotle is by far the most commonly invoked authority.

Al-Tawhidi’s main philosophical work is *al-Muqabasat (Borrowed Lights)*. *Al-Imta‘ wa’-mu’anasa* also contains some philosophical material, besides some which is predominantly literary or grammatical. In metaphysics, he follows the basic Neoplatonic scheme of emanation (see Neoplatonism in Islamic philosophy). The First, frequently called the Creator, is the source of the world of nature which emanates continuously from him; God is thus also characterized by his generosity. Intellect, Soul and Nature are the three main levels of being, or hypostases, emanating from the First. The process is sometimes expressed in terms of illumination; the Intellect receives its light from the First, the Soul from the Intellect and Nature from the Soul. Elsewhere, the soul is considered as being pure light. Conversely, the First is said to encompass the Intellect, which in turn encompasses the Soul and so forth.

Many paragraphs are devoted to the human soul, concerning which al-Tawhidi takes up positions that can be defined as Platonic. The soul subsists by itself and is not tied down to the body; on the contrary, it uses the body as an instrument. The soul does not arise from the mixture of the elements; thus the Galenic theory is implicitly rejected, although it is ascribed in one passage to Zeno (probably meaning the Stoic) (see Galen; Zeno of Citium). The union with the body is described as a kind of fall in a way which has clear antecedents in some soteriological conceptions of Gnosticism and Neoplatonism (see Gnosticism; Neoplatonism). In the course of the soul’s descent from the heavenly realm it became covered in scales or veils, which it will cast off after physical death, that is, when it relinquishes the body. The soul becomes like a rusty mirror; just as the latter is no longer capable of reflecting external objects, the soul forgot what it knew in the intelligible world. Its true nature is also more fully active in sleep. In our ordinary waking life, we do not remember the world where our soul originated because we have been overcome by matter. These two states of the soul, incarnate and immaterial, correspond to the two realms of intellection and sense-perception. Intellection is an immediate form of apprehension, devoid of reflection and deliberation, whereas sense-perception is linked to discursive and inductive modes of thought, such as syllogism.

Humanity is thus in an intermediate position between the world of intellect and the world of nature. The latter is integrated into the emanationist scheme more neatly than is the case in Greek Neoplatonism; nature is a life force which emanates from the First Principle and penetrates all bodies, giving them their forms and linking them together. The Aristotelian definition of nature as principle of motion and rest is also quoted more than once.

Al-Tawhidi evinces a keen interest in linguistic questions. He predictably maintains the superiority of Arabic over other languages, but also discusses such topics as the respective place and function of prose and verse (see Aesthetics in Islamic philosophy). It is thanks to him that we have a report of the controversy between the partisans of logic and Greek culture and those of traditional Arabic grammar. Another discussion tackles the sensitive problem of the relationship between philosophy and religion. Among the current themes of his time, that of the characters and respective merits of the nations is taken up on several occasions. In the field of ethics, he devoted an entire epistle to friendship, and this is one of his more personal and interesting works.

Alterity and identity, postmodern theories of

Theories of alterity and identity can be said to be 'postmodern' if they challenge at least two key features of modern philosophy: (1) the Cartesian attempt to secure the legitimacy of knowledge on the basis of a subject that immediately knows itself and (2) the Hegelian attempt to secure self-knowledge and self-recognition by showing that knowledge and recognition are mediated by the whole. Postmodern thought does not necessarily champion a wholly other, but it generally conceives of self-identity in terms of a radical alterity.

1 Features of postmodern thought

Postmodern theories of identity and alterity refer to the use of these terms in modern philosophy. But the relation between modernity and postmodernity is not a simple matter, for much of what has come to be known as postmodern thought seeks to discover a 'postmodern moment' at the inception of modernity. According to Jean-François Lyotard, whose *Postmodern Condition* (1984) ignited many of the philosophical debates concerning the status of postmodernity, the various manifestations of modernity - in architecture, literature, art and philosophy - can be seen as retreats from these postmodern moments, and one of the tasks of postmodern thought is to retrieve the gestures and motifs that modernity has been compelled to erase in order to institute itself as an ever renewable project or method. Postmodernity appears in its own right once these projects and methods can no longer *guarantee* their own legitimacy.

In order to understand the 'postmodern condition' it is therefore necessary to pay attention to the breakdown of the various 'meta-narratives' by which modernity has tried to legitimize itself. To the extent that modern philosophy from its inception in Descartes' *Meditations* sets out to secure the validity of knowledge, postmodern thought can be understood as a wide-ranging effort to come to terms with - and not simply denounce or repair - the failure of all philosophical attempts to secure the legitimacy of knowledge. The concepts of identity and alterity are of particular importance for this effort because the Cartesian attempt to secure the legitimacy of knowledge finds its principle point of reference in the identity of the self-conscious subject. This subject can serve as the source of legitimation to the extent that it can immediately identify itself and can treat its act of self-identification as knowledge. Postmodern theories of identity and alterity are concerned for the most part with the nature of self-identity and with the relation between the self and whatever presents itself as other than the self. The following discussion does not seek to cover all of the writers who have been classified as postmodern but first defines one version of postmodern philosophy and then considers certain exemplary thinkers for whom the nature of self-identity and the relation of the self to the other are of paramount importance.

If modern philosophy rests on the principle of self-consciousness, then one criterion for a postmodern philosophy would be its contesting of this principle. Yet postmodern philosophy cannot simply demonstrate that the self-conscious subject is unable to secure the legitimacy of knowledge by an act of immediate self-identification: not only are such demonstrations part and parcel of many modern philosophical projects, Hegel's attempt to complete modern philosophy begins by pointing out the abstract character of the Cartesian ego. In order for postmodern thought to distinguish itself from its modern counterparts it cannot simply assert that the identity of the self is derived from - or, in the Hegelian version, mediated by - something else; the other that allows the self to identify itself cannot be, as for Hegelians, the whole; it must be the *wholly* other, not the other *of* the self but an other that no longer pertains to the self. Even if this other grants the subject its identity, it must retreat from all attempts on the part of philosophical methods or systems to grasp it *as* something, even as something 'other'. The importance of Nietzsche and Freud for the development of postmodern thought can be seen from this perspective, for they provide intricate analyses of consciousness as a secondary process and also propose something - the will, the unconscious - that withdraws from consciousness but cannot then be reinterpreted in terms of a metaphysical substance (as can Schopenhauer's will or Hartmann's unconscious). Postmodern thought does not necessarily champion a 'wholly other', but it declines the Hegelian proposal that the legitimacy of knowledge, including self-knowledge and self-consciousness, should be sought in the concept of a self-mediating whole.

2 The dialectics of desire

The rejection of Hegelian accounts of the relation between the self and the other can be counted among the criteria of postmodern thought. A decisive moment in the development of such thought - and a reason it has developed

most conspicuously in France - is found in Alexandre Kojève's striking interpretation of Hegel's 'master-slave dialectic' as a logic of human desire (see Kojève, a.). According to Kojève, the object of desire is never a tangible thing; every desire is a desire for recognition by the other. The slave wants to be recognized by the master; but since the master cannot be recognized by the slave without ceasing to be a master, he must look toward the 'absolute master' - death - to secure recognition. Self-negating (suicidal) desire propels history toward its completion, at which point everyone recognizes everyone else; but this stage of satisfied desire, 'the Sunday of History', is itself deeply problematic because all the categories by which someone can be recognized as something have been exhausted. By taking seriously Hegel's talk of the end of history and the end of philosophy, Kojève set the stage not only for postmodern thought but also for a host of 'post-philosophical' and 'post-historical' pronouncements.

Some of those who heard Kojève's lectures on Hegel, especially Georges Bataille and Jacques Lacan, developed new concepts of the subject from his dialectics of desire. Bataille (1985) wrote extensively of a sovereign subject which is always other than itself precisely because it never recognizes itself in any other, and Lacan found in Freudian psychoanalysis a subject of dreams and slips of the tongue, a subject which is therefore no longer in control of, or even present to, itself. According to Lacan's famous theory of the 'mirror stage', the self does not constitute itself by recognizing itself in its other but by identifying itself with its specular image: its identity is thus based on misrecognition (*méconnaissance*). The Other, who is not to be confused with another self or an *alter ego*, 'mediates' between the self and its specular counterpart. According to Lacan, Freud discovers a 'radical heteronomy… gaping within man' and responds to the question 'who, then, is this other to whom I am more attached than to myself, since at the heart of my assent to my identity it is still he who agitates me?' ('Agency of the Letter', in Lacan 1977) by conceiving of the other side of consciousness in a radically new way. Without 'the discourse of the Other' - which is one of Lacan's names for the unconscious - there would be neither the desire for recognition nor recognition of desire, for no object is adequate to desire. The locus of such inadequation is language, more exactly, 'the signifier' understood as that which forever slips away from signification. Lacan then defines desire as 'the desire of the Other', but this definition does not mean that the ego wants what an *alter ego* desires; rather, it indicates that the self desires only *as* the Other and thus cannot recognize the object of its desire. The self is, as it were, a detour in the trajectory of the desire of the Other.

Lacan's theory of desire arrives at a conundrum: how can we understand the fact that subjects desire very specific objects? He invented the term 'object a' (where the 'a' stands for *autre*, 'other') in response to this question. Such objects are distinguished by the fact that 'they have no specular image, or, in other words, alterity' ('Subversion of the Subject', in Lacan 1977). When Lacan counts the subject of consciousness among these 'other objects', he makes the question of self-identity considerably more complicated, for, on the one hand, the self is constituted by misidentifying itself with its specular image, and, on the other, it has no specular image but is only, as Lacan says, a 'shadow'. One trenchant response to the complications generated by Lacan's attempt to understand the specificity of objects of desire can be found in the work of Julia Kristeva, especially in her *Powers of Horror* (1982). Kristeva articulates the Lacanian analysis of alterity into three distinct moments - the Other, the *alter ego*, and the 'other' as object of desire - by concentrating on what cannot be captured by a dialectics of desire: the utterly undesirable or 'abject'. The self experiences abjection when it senses an undefinable 'something' that precedes, inhabits, and threatens to engulf it. For this reason, the abject is violently - but also only incompletely - expelled:

> I experience abjection only if an Other has settled in place and stead of what will be 'me'. Not at all an other with whom I can identify and incorporate, but an Other who precedes and possesses me, and through such possession causes me to be.
>
> (Kristeva 1982: 10)

Certain categories of religious discourse such as defilement, abomination and purification can be understood, according to Kristeva, in terms of abjection. Once the abject is excluded, it serves as the foundation of an always precarious culture within which objects of desire can be separated from one another.

3 The experience of alterity

The writings of Lacan and Kristeva are as much contributions to psychoanalytic practice as independent

theoretical exercises. Yet the questions to which they are addressed - the dialectics of desire, the experience of the alterity of the self - have also been posed by Emmanuel Levinas from a very different perspective. While studying the work of Husserl and Heidegger, Levinas came to realize that the phenomenology of the other cannot be accomplished in the same manner as the phenomenology of consciousness or the hermeneutics of existence. Levinas opens his most extensive work, *Totality and Infinity* (1969), by defining desire as 'desire for the absolutely other'. Because every object is inadequate to desire, its meaning must lie in the 'alterity of the Other [*autrui*]'. The phenomenological elucidation of the *autrui* (the 'personal' other) cannot simply be a matter of theoretical attitudes and descriptions because the *autrui* is never a definable theme. Instead of grounding philosophy on the *cogito*, Levinas returns to Descartes' discussion of 'the idea of infinity' as that which 'overflows' every intentional state. *Totality and Infinity* then presents subjectivity 'as welcoming the Other, as hospitality; in it the idea of infinity is consummated' (1969). Not only is the totality of entities to be distinguished from the totally other, so too is the phenomenon from the face: in the naked face of the *autrui* the idea of infinity overflows consciousness and its objects. The other can never be reduced to the same - not to the identity of the *cogito* (epistemology) nor to the sameness of being (ontology) - and so ethics becomes, for Levinas, 'first philosophy'.

In his second major work, *Otherwise than Being* (1981), Levinas no longer speaks of subjectivity as hospitality but as hostage: the self is not only held hostage by the other, but, as a hostage, it also 'substitutes' - and thus takes responsibility - for the other who holds it hostage. This paradoxical responsibility cannot be represented in terms of a self-positing subject, for, as the term 'hostage' indicates, the self is from the start sheer passivity:

> The uniqueness of the ego, overwhelmed by the other in proximity, is the other in the same, the psyche. But it is I, I and no one else, who am hostage for the others. In substitution my being that belongs to me and not to another is undone, and it is through this substitution that I am not 'another', but me.
>
> (1981: 116)

It is only because the self is assigned to the other before it acts on its own that it can be itself, that is, singular. Throughout his writing Levinas discovers an unmediated alterity in every identity: the vulnerability, susceptibility and 'nudity' of the self is evidence of such alterity. For philosophy to come to terms with evidence of this kind it must abandon idealism as well as empiricism and revise its notions of experience and sensibility. Experience does not consist in subsuming mental representations under general terms but in taking responsibility for the other and exposing oneself to one's own alterity.

Although the work of Gilles Deleuze could hardly be more different in tone and texture than that of Levinas, he too seeks to revise philosophical concepts of experience and sensibility, and, like Levinas, his programme takes its point of departure from a critique of all claims to identity. But unlike Levinas, he does not undertake this critique as an advocate, so to speak, of the transcendence of the other but as a champion of entirely immanent 'differential forces'. Whereas Kant treats identity and difference as concepts of reflection, Deleuze tries to develop a concept of difference in which it is no longer a term of reflection and can no longer be seen as the opposite of identity. Difference, for Deleuze, always implies a multiplicity of relations among positive forces, each of which expresses itself but none of which opposes any other. According to the terms set forth in *Difference and Repetition* (1981), every 'philosophy of representation' rests on a principle of identity. The reduction of difference to opposition serves to make singularities - and, for Deleuze, everything is a singularity - into representations of generic types. Every philosophy of representation denies difference in favour of identity and thus turns into a philosophy of negation. Difference must be negated in order to save the self-identical subject, even if - as in the case of Hegelianism - this negation is doubled, and the subject appears only as the negation of everything that opposes it.

All of Deleuze's writings emphasize the positivity of difference. *Anti-Oedipus* (Deleuze and Guattari 1977), perhaps his best-known book, not only attacks psychoanalysis for conceiving of desire in terms of castration (lack of the phallus) but seeks to undermine every conception of desire as absence or negativity. The question then arises: how can one account for alterity without using concepts such as lack, absence or negativity? The concluding sections of *Difference and Repetition* respond to this question. Sensible differences, according to Deleuze, are always differences of intensity: 'Intensity is the form of difference in so far as this is the reason of the sensible' (1994: 222). In order for an intensity to be experienced, it must first be developed or 'explicated'. But an

intensity (a *quale*) cannot be explicated unless it is transformed into an extension (a quantity) in accordance with a specific principle of identity. The ‘psychic system I-Self’ is one particularly complicated version of explication. The other enters into Deleuze’s philosophical scenario as the site of still unexplicated intensities. Instead of using words like ‘negativity’ or ‘absence’ to conceive of alterity, Deleuze employs a modal version of these terms - possibility - and he, like Levinas, finds in the human face the exemplary experience of alterity: ‘Consider a terrified face…. This face expresses a possible world: the terrifying world…. In every psychic system there is a swarm of possibilities around reality, but our possibles are always Others’ (1994: 260). The self, in sum, is the explication of implied intensities in accordance with a principle of identity, whereas the other, as an expression of a possible world, ‘represents’ the otherwise inaccessible intensities on which the ‘psychic system’ is founded.

4 Aporias of the wholly other

Jacques Derrida, like Deleuze, has developed a philosophy of difference, but unlike Deleuze, he does not present it as an alternative to the philosophy of identity. Derrida’s philosophical enquiries respond to a double exigency: they seek to show, on the one hand, that the operation of the principle of identity always rests on an unacknowledged play of difference and, on the other, that neither difference nor alterity can serve as principles on which a new philosophical project can be built. Derrida begins one of his earliest writings, ‘Descartes and the History of Madness’, by showing that the project Foucault undertakes in *Madness and Civilization* (1965) cannot be accomplished: it is not only impossible to let madness ‘itself’ speak, but it is also impossible to write an ‘archaeology’ of the silence into which the mad are driven without relying on the resources of reason (*logos*). Derrida then interrogates the very opposition between madness and reason by pointing toward a madness (or being *aliéné*) at the heart of modernity’s first philosophical manifesto, Descartes’ *Meditations*: in the process of constituting itself, according to Derrida’s reading, the self-reflective subject exposes itself to a doubt so hyperbolic that it exceeds every effort on the part of the self-reflective subject to bring it under control.

Because it is impossible to find a position from which to criticize the principle of identity without defining this position in terms of self-identity, Derrida refrains from describing his work as a ‘critique’ and prefers the word ‘deconstruction’ (see Deconstruction). The deconstruction of the principle of identity not only demonstrates the impossibility of any critique of identity in the name of alterity but welcomes this impossibility, for it implies that the self can never be entirely separated from the other. Philosophy cannot disclose a pure self or a pure other, but this impossibility cannot be resolved in a Hegelian manner by representing the subject as the process of self-mediation in the other. Yet it is *also* impossible, according to Derrida, simply to refuse this Hegelian move and once again presuppose, posit or postulate a wholly other. There is, for Derrida, such an other, but it does not exist, if ‘existence’ is defined by self-identity and presence-to-oneself. A philosophical enquiry cannot set out from or arrive at the wholly other; it *comes* - without being destined and without destination. Insofar as the future (*avenir*) is opened up by this coming (*venir*), it is the venue of alterity, and insofar as justice (in contrast to legal norms) always implies a singular relation to a singularity, according to Derrida, this future is also the site of justice.

All of the aporias surrounding the idea of a radical alterity are captured in one of Derrida’s most suggestive sentences: *tout autre est tout autre*, ‘every other is wholly other’ (1994: 82). This assertion of the radical and irreducible alterity of every other is at the same time a radical assertion of identity, for the sentence can also be understood as a tautology: ‘every other is every other’. In a single sentence Derrida thus captures one of the great challenges of all postmodern thought: by championing a radical alterity, it runs the risk of turning into a tautological affirmation of identity. Derrida emphasized the impossibility of safeguarding any thought of the wholly other from this risk, but he also insists that thought can never run away from such risks.

Althusser, Louis Pierre (1918-90)

Louis Althusser was the most influential philosopher to emerge in the revival of Marxist theory occasioned by the radical movements of the 1960s. His influence is, on the face of it, surprising, since Althusser's Marx is not the theorist of revolutionary self-emancipation celebrated by the early Lukács. According to Althusser, Marx, along with Freud, was responsible for a 'decentring' of the human subject. History is 'a process without a subject'. Its movement is beyond the comprehension of individual or collective subjects, and can only be grasped by a scientific 'theoretical practice' which keeps its distance from everyday experience. This austere version of Marxism nevertheless captured the imagination of many young intellectuals by calling for a 'return to Marx', with the implication that his writings had been distorted by the official communist movement. In fact, Althusser later conceded, his was an 'imaginary Marxism', a reconstruction of historical materialism reflecting the same philosophical climate that produced the post-structuralist appropriations of Nietzsche and Heidegger by Deleuze, Derrida and Foucault. Most of the philosophical difficulties in which Althusser found himself can be traced back to the impossibility of fusing Marx's and Nietzsche's thought into a new synthesis.

1 Life

On a pessimistic view of his influence, Althusser may be chiefly remembered for strangling his wife, Helene Rytman, on 16 November 1980, in their flat at the École Normale Superieure in Paris. Deemed unfit to stand trial for the murder, Althusser spent the last decade of his life in and out of mental hospitals. His attempt to explain this disaster - in *L'Avenir dure longtemps (The Future Lasts A Long Time)* (1992), an extraordinary confessional autobiography, posthumously published, which traced the manic depressive outbursts which dogged his adult life back to a Freudian family drama which began even before his birth in Algeria - has been shown by Yann Moulier Boutang (1992) to be as much fiction as fact.

Thanks, however, to his own memoirs and Moulier Boutang's biography, the outline of Althusser's public life is now becoming clear. From his Lyons schooldays in the 1930s until the early 1950s he was active in Catholic political circles. But, whereas before the Second World War Althusser was associated with the anti-republican right ('We were more or less… royalists then', he later wrote), the four years he spent in a German prisoner-of-war camp after France's defeat in 1940 pushed him to the left. Like many young French intellectuals of his generation, he rallied to the communist party after the war, joining in 1948. Until the Church's suppression of the worker-priest movement in the early 1950s Althusser sought to reconcile Marxism and Catholicism. In these years he espoused a messianic Hegelian Marxism, in some ways reminiscent of the early Georg Lukács (see Lukács, G. §2). The thesis for which Althusser was to become famous in the 1960s - that Marx had had to break with his own youthful Hegelian past - therefore recapitulated his own personal development.

In July 1948 Althusser was appointed *caïman* at the École Normale Superieure, a post he was to hold until the tragedy of November 1980. He was responsible for preparing philosophy students for the *agrégation*, or final examination. Althusser was an outstanding teacher, and the central role which the École Normale played in the teaching of philosophy in France (virtually every major twentieth-century French philosopher has been a *normalien*) meant that he had an exceptional influence on French intellectuals for a generation. But it was his writings of the 1960s - notably those in *Pour Marx (For Marx)* and *Lire le Capital (Reading Capital)*, both published in 1965 - which made Althusser a major figure on the intellectual scene. His reinterpretation of Marx, developed in collaboration with an exceptionally talented group of pupils, served to articulate young left-wing intellectuals' impatience with the caution and conservatism (as they saw it) of the communist party leadership. Unlike many of his followers, Althusser did not break with the party, even after what he regarded as its failure to seize the revolutionary opportunity presented by the events of May-June 1968. He found himself, however, increasingly at odds with the official apparatus. His last major public act was 'What Must Change in the Party', a root-and-branch denunciation of the leadership published in *Le Monde* in April 1978. By then, however, the Parisian intelligentsia had fallen out of love with Marxism, and Althusser's last years were spent in intellectual as well as personal isolation.

2 Rereading Marx

Althusser's reinterpretation of Marx involves, in the first place, a theory of interpretation. 'There is no such thing

as an innocent reading', he says. Every approach to a text brings with it certain theoretical presuppositions. Therefore 'a new theory of ''reading"' is required, one that is concerned to identify the theoretical framework implicit in the text itself, or what Althusser calls its 'problematic'. The problematic, he claims, is typically concealed within the text rather than visible on its surface. It can be detected, rather like the repressed desires which psychoanalysis supposes it uncovers, in the text's silences, gaps, ambiguities and inconsistencies. Texts are thus complex, and this complexity is, as we shall see, one aspect of the complexity of history itself.

When applied to Marx, this theory of reading reveals a discontinuity. Marx's writings up to and including the *Economic and Philosophic Manuscripts of 1844* belong to one problematic which Althusser regards as ideological. Their leading characteristic is their humanism: history is depicted as the unfolding of a human essence which, alienated under capitalism, will find fulfilment under communism. These early works of Marx are separated from his later writings, above all *Capital*, by an 'epistemological break' marking the formation of a new science of history. The mature Marx is a 'theoretical anti-humanist', for whom history is 'a process without a subject or goal'. It is not the development of the productive forces, or the self-realization of the working class conceived (as it was by the early Lukács) as the 'identical subject-object' of history, nor is socialist revolution the inevitable culmination of the historical process. Althusser liked to say that 'the materialist… is a man who catches a moving train without knowing where it has come from or where it is going' (1992: 210). Human beings are the 'bearers' of a process they neither create nor control.

The break from which Althusser's scientific, anti-humanist Marx emerged was above all one with Hegel. Althusser's most celebrated essay, 'Contradiction and Overdetermination' (1962; repr. in *For Marx*), was a direct attack on the idea, hitherto basic to Marxist orthodoxy, that Marx, while rejecting Hegel's idealist system, had taken over his dialectical method. Althusser pointed out that this contrast between method and system involved a separation of form and content that was itself 'pre-dialectical', contradicting Hegel's own account of his method. The formulation of a materialist dialectic required not the application of Hegel's method to a different object but 'the transformation of its structures'. Althusser sought to bring out the difference between Marx and Hegel by contrasting their conceptions of totality. As Lukács had argued, both might view society as an integrated whole, but the way in which they conceived this whole was very different. Hegel's was an 'expressive totality', in which all the different aspects of social life reflected a single informing centre. Taken over in a Marxist framework, this totality leads to economic reductionism; everything becomes an expression of the fundamental economic contradiction, in the way that, according to Lukács, reification pervades the whole of capitalist society (see Marxism, Western §2).

For Marx, by contrast, each social formation is a complex, structured totality composed of a plurality of practices irreducible to one another. The economy is 'determinant in the last instance', that is, its primacy consists not so much in its directly shaping the course of historical development, as in its selecting some particular 'instance' (or practice) to play the dominant role (politics, for example, in feudal society). Economic causality thus operates indirectly, and always in combination with non-economic practices. As Althusser famously put it, 'the lonely hour of the "last instance" never comes' ([1965] 1969: 113). What Marx called the superstructure - politics, law and ideology - is 'relatively autonomous': each practice develops according to its own specific laws, within the limits set for it by the economy. Thus major historical events, for example, the Russian Revolution of February 1917, are 'overdetermined': they are not simply expressions of an underlying contradiction between the forces and relations of production, but involve a combination of heterogeneous factors - economic, political, ideological - which accumulate until they produce a rupture.

This complexity of the social whole is one reason why Althusser does not believe that individuals can understand the history in which they are caught up. Ideology, he believes, is a necessary feature of any society, including the classless communism of the future. It serves as a factor of social cohesion, adapting human beings to the roles required of them as bearers of the prevailing relations of production. The very form of subjectivity - individuals' conception of themselves as coherent and autonomous persons - is the means through which they are subsumed under ideological social relations. The only way out of this imaginary relationship lies in scientific theory. The formation of a scientific problematic - for example, Marx's epistemological break - allows an escape from the repetition of a few stereotyped ideological themes into a potentially infinite process of theoretical self-development. Here too, however, individuals figure only as the bearers of an impersonal social process, since each science develops according to the conceptual patterns specific to it.

3 Conclusion

Though carried out under the slogan of a ‘return to Marx’, his rescue from the misinterpretations perpetrated both by orthodox Communists and by Hegelians such as the early Lukács, Althusser’s reading of Marx was on his own admission a ‘guilty’ one, reflecting a variety of influences. He himself paid explicit tribute to Spinoza and Freud in particular, and the debt his philosophy of science owed to his teacher Bachelard is evident. More generally, Althusser’s anti-humanism bears a strong resemblance to the attack on the subject as a unified and sovereign entity which, initiated in the 1950s by Lacan and Levi-Strauss, was to be radicalized in the late 1960s by Deleuze, Derrida and Foucault (see Post-structuralism §§2-4). But post-structuralism derives ultimately from Nietzsche’s critique of modernity, with its tendency (never fully realized in Nietzsche himself, but taken much further in his own way by Heidegger) to reject the Enlightenment *tout court*. How could Marxism, deeply embedded in which are preoccupations with progress and emancipation, place itself in the camp of the counter-Enlightenment? More specifically, in rejecting economically reductionist versions of Marxism, was not Althusser in danger of developing a pluralist conception of the social whole in which the economy had lost any causal primacy? Again, if each ‘theoretical practice’ developed autonomously according to its own internal norms, how could Althusser maintain a distinction between science and ideology and thereby resist Foucault’s Nietzschean reduction of all knowledge to expressions of the will to power? Althusser’s philosophical enterprise ultimately ran aground on these and similar difficulties. Nevertheless, his insistence on a careful conceptual analysis of Marx’s writings as the basis of a reconstruction of historical materialism, his demonstration of the methodological gulf separating Marx and Hegel, and his sensitivity to developments in the philosophy of science that were ignored by the Frankfurt School, for example, make his work of lasting value.

ALEX CALLINICOS

List of works

Althusser, L. (1959) *Montesquieu, La politique et l’historie*, Paris: Presses Universitaires de France; trans. B. Brewster in *Politics and History*, later renamed *Montesquieu, Rousseau, Marx*, London: New Left Books, 1972.(A stimulating interpretation of Montesquieu as both a theorist of absolutism and one of the first historical sociologists; the English edition contains important essays on Rousseau’s *Social Contract*, and on Marx’s relationship with Hegel.)

Althusser, L. (1965) *Pour Marx*, Paris: Maspero; trans. B. Brewster, *For Marx*, London: Allen Lane, 1969. (Althusser’s most famous book, a collection of essays that outline his theory of overdetermination and his account of the ‘epistemological break’ separating the young Marx from the old.)

Althusser, L., Balibar, E., Establet, R., Macherey, P. and Ranciere, J. (1965) *Lire le Capital*, Paris: Maspero; partly trans. B Brewster in Althusser, L. and Balibar, E., *Reading Capital*, London: New Left Books, 1970.(The most sustained attempt by Althusser and his pupils to characterize what distinguishes Marx’s method from the Hegelian dialectic; it helped to stimulate close philosophical scrutiny of the conceptual structure of *Capital*.)

Althusser, L. (1969) *Lénine et La philosophie*, Paris: Maspero; trans. B. Brewster in *Lenin and Philosophy and Other Essays*, London: New Left Books, 1972.(Advances the notoroius thesis that ‘philosophy is, in the last instance, the class struggle in theory’; the English edition also includes two of Althusser’s most influential essays: ‘Freud and Lacan’ and ‘Ideology and the Ideological State Apparatuses’.)

Althusser, L. (1970) ‘Sur le Rapport de Marx à Hegel’, in J. D’Hondt (ed.) *Hegel et la pensée moderne*, Paris: Presses Universitaires de France; trans. B. Brewster, ‘Marx’s Relation to Hegel’, in *Politics and History*, London: New Left Books, and New York: Verso, 1972.(Argues that Marx understood Hegel’s dialectic in terms of process.)

Althusser, L. (1973) *Réponse à John Lewis*, Paris: Maspero; trans. G. Locke in *Essays in Self-Criticism*, London: New Left Books, 1976.(Althusser’s polemical defence of his ‘theoretical anti-humanism’ at the height of his Maoist phase.)

Althusser, L. (1974a) *Éléments d’autocritique*, Paris: Hachette; trans. G. Locke in *Essays in Self-Criticism*, London: New Left Books, 1976.(A self-criticism which takes *For Marx* and *Reading Capital* to task for ‘theoreticism’ and ‘flirting with strucuralism’.)

Althusser, L. (1974b) *Philosophie et philosophie spontanée des savants*, Paris: Maspero; trans. W. Montag in *Philosophy and the Spontaneous Philosophy of the Scientists and Other Essays*, London: Verso, 1990. (Althusser’s main discussion of the relationship between philosophy and the sciences; the English edition also

reprints ‘Lenin and Philosophy’ and other important texts of the 1960s and 1970s.)

Althusser, L. (1978) *Ce qui ne peut pas plus durer dans le parti communiste*, Paris: Maspero; trans. P. Camiller, ‘What Must Change in the Party’, *New Left Review* 109: 19-45. (First published in *Le Monde*, 24-7 April 1978, in the wake of the left’s defeat in the French legislative elections; a fierce indictment of the communist party’s Stalinist internal regime.)

Althusser, L. (1988) ‘Machiavelli’s Solitude’, trans. T. O’Hagan, *Economy and Society* 17 (4): 468-79.(A lecture on Machiavelli, a thinker who was a major influence on Althusser.)

Althusser, L. (1992) *L’avenir dure longtemps suivi de les faits*, Paris: Stock/IMEC; trans. R. Veasey, *The Future Lasts a Long Time*, London: Chatto & Windus, 1993.(Two autobiographical texts; the first and longer one, written after Althusser’s disgrace, is a remarkable human document, and contains important reflections on his philosophical and political career. The second edition, published by Stock/IMEC in 1994, contains some important additional material, including a text in which Althusser discusses Machiavelli and Spinoza as materialist precursors of Marx.)

Althusser, L. (1993) *Écrits sur la psychanalyse (Writings on Psychoanalysis)*, Paris: Stock/IMEC.(Brings together all Althusser’s writings on Freud, thereby helping to clarify the significant influence that Jacques Lacan had on him.)

Althusser, L. (1994) *Sur la philosophie (On Philosophy)*, Paris: Gallimard.(An interview and correspondence with Latin American admirers, dating from the mid-1980s, and chiefly notable as an instance of the late Althusser’s stress on ‘the true materialist tradition’ (Macchiavelli, Spinoza and Rousseau) that antedated Marx.)

Althusser, L. (1994, 1995) *Écrits philosophiques et politiques*, Paris: Stock/IMEC, 2 vols. (Volume 1 contains Althusser’s previously unpublished early Hegelian writings; Volume 2 offers a wealth of hitherto unpublished texts from Althusser’s middle and late periods.)

al-Tusi, Khwajah Nasir (1201-74)

While philosophical activity in the Islamic west virtually ceased after Ibn Rushd at the close of the sixth century AH (twelfth century AD), it experienced renewed vigour in the east through the intellectual efforts and political involvement of Nasir al-Din al-Tusi. Although primarily a reviver of the peripatetic tradition of Ibn Sina, he was also possibly influenced by the ideas of al-Suhrawardi. He defended Ibn Sina from the criticisms levelled against him from the direction of theology, notably by Fakhr al-Din al-Razi, made a significant contribution to the acceptance of metaphysical argumentation and terminology in Twelver Shi'i theology, brought the ethical tradition of Ibn Miskawayh and the philosophers into the centre of Islamic ethical discourse, and had a lasting effect on the study of the exact sciences in Islam through both his original contributions to mathematics and astronomy and the observatory at Maraghah which the Mongol Khan Hülegü established for him.

1 Intellectual development

Al-Tusi's intellectual development cannot be divorced from the drama of his own life, and the catastrophe of the Mongol invasion of the Islamic east. From his birth in Tus in Khurasan in northwest Iran in AH 597/AD 1201 up to his middle or late twenties, al-Tusi lived in a Twelver Shi'i milieu, in a family whose idea of learning was, according to his own account, the study of the religious law, and whose behaviour was measured by its practice. His jurist father, however, was sufficiently broad-minded to encourage him beyond scholastic studies to the philosophical and natural sciences, and to acquaint himself with the doctrines of other schools and sects. To study philosophy, al-Tusi went to nearby Nishapur, where he was taught by a scholar whose teaching lineage went back to Ibn Sina. Early in his career, as al-Tusi himself later wrote, he was not convinced that the intellect could answer the ultimate metaphysical questions, since it would thereby be inquiring into its own origins, something of which it would be incapable. Perhaps as a way out of his perplexity, and quite possibly as the result of sectarian connections through an uncle, he turned to the Isma'ilism of his day, which had been influenced by the Neoplatonic speculations of Isma'ili thinkers in the third and fourth centuries AH (ninth and tenth centuries AD). Isma'ili doctrine turned on the concept of an infallible Imam, without whose guidance, it claimed, the unaided intellect was unable to reach the truth.

From his late twenties or early thirties, al-Tusi was in the service of the local Isma'ili leaders of northern Iran, writing a number of theological and philosophical works for them in both Persian and Arabic and beginning his contribution to a major revival of Peripatetic philosophy in eastern Islamic lands. With the Mongol invasion of Iran in the middle of the thirteenth century the Isma'ili strongholds were destroyed, and al-Tusi found himself involved in the negotiations leading to the surrender of the Grand Isma'ili Master to the invaders. His efforts were appreciated by the Mongol conqueror Hülegü, who took him on as an advisor, in which capacity he assisted at the sacking of Baghdad in AH 656/AD 1258. Later al-Tusi was put in charge of religious endowments and affairs. Hülegü also had the great observatory and library at Maraghah built for al-Tusi, where he led a team of scientists and mathematicians from as far away as China. It is clear that immense resources were put at his disposal for this project, where the teaching and study of philosophy went on hand in hand with that of the exact sciences.

The end of his Isma'ili period also marked al-Tusi's turn (or return) to Twelver Shi'ism, and the last period of his life witnessed not only a remarkable output of scientific works but also a reformulation of Imami theology in philosophical terms which was as influential in the Shi'i world as was that of Fakhr al-Din al-Razi in the Sunni. Al-Tusi died in AH 672/AD 1274 in Baghdad, in the same year as Thomas Aquinas. He was buried according to his last wishes beside the shrine of the seventh Twelver Imam, Musa ibn Ja'far, in Kazimayn just outside Baghdad. Among his most remarkable students were the philosopher Qutb al-Din al-Shirazi (d. AH 710/AD 1310) and the Imami jurist and theologian, the 'Allamah al-Hilli (d. AH 726/AD 1325).

If in his early life al-Tusi believed in the need for reason to be sustained by a non-rational (or supra-rational) guarantor, his move to Twelver Shi'ism, with its doctrine of the hidden, inaccessible Imam, indicates a growing strength in his convictions about the ability of the intellect. His sectarian shifts have given rise to much argument concerning his genuine doctrinal loyalties, but throughout his life there runs a consistent philosophical thread whose main characteristic was the defence, rehabilitation and elaboration of Ibn Sina's method and theories. It is through his interpretations in texts, epitomes, commentaries and refutations that subsequent generations in the

Islamic east have approached their understanding of Ibn Sina. His output as an author in both Arabic and Persian was prodigious, including lasting contributions to logic, metaphysics, ethics, mathematics and astronomy.

2 Logic, metaphysics and theology

Al-Tusi's main contribution to logic is contained in his Persian *Asas al-iqtibas (The Ground for the Acquisition of Knowledge)*, written during his Isma'ili period. It is divided according to the habitual ten sections of the organon of the Islamic world, and its discussion of substance has recently attracted attention (Morewedge 1975). It also stands as a testimony to al-Tusi's ability to write about technical subjects in Persian, by incorporating Arabic terminology into a fluent and graceful style. An Arabic manual of logic by al-Tusi, the *Tajrid al-mantiq (Abstract of Logic)*, was commented on by his pupil the 'Allamah al-Hilli.

However, the major text on which al-Tusi's reputation as an interpreter of Ibn Sina's philosophy rests is his commentary on the *Kitab al-Isharat (Remarks and Admonitions)*, written towards the end of his stay with the Isma'ilis. Al-Tusi's work was in part, at least, intended as a response to the commentary of Fakhr al-Din al-Razi on the same text. This work shows one of al-Tusi's continuing complaints, that those who attack Ibn Sina are generally ill-equipped as philosophers and that analysis can reveal their weaknesses. He is not averse to the use of polemic himself, but his insistence that a philosopher be evaluated in terms of the soundness of his argumentation and not according to preconceived ideas about conclusions demonstrates his faithfulness to Ibn Sina's own method. Thus, although on the whole defending Ibn Sina's theories, he disagrees with the latter when he sees fit. In his interpretation of emanation, for example, al-Tusi is partly in agreement with al-Suhrawardi concerning the nature of God's knowledge, although he does not entirely reject Ibn Sina's theory of identity of form between knower and known as being applicable to other existents (see Ibn Sina). God's knowledge of the First Intellect, and consequently of the entire universe, is identical with its existence through a kind of presential knowledge, while lower entities in the emanative chain derive their knowledge through forms and representations as well as through presence. Al-Tusi's commentary is clear and systematic, and is still studied with the original text because of his lucid explanations of Ibn Sina's often difficult and dense prose.

The texts discussed so far belong to al-Tusi's Isma'ili period, but the break with this past was decisively accomplished in *Masari' al-musari' (The Floorings of the Wrestler)*, a refutation of an Isma'ili Neoplatonic text by the crypto-Isma'ili al-Shahrastani (d. AH 548/AD 1153) which attacked Ibn Sina for deviating from 'prophetic theology'. Al-Tusi's vehemently anti-Isma'ili defence of Ibn Sina is unreservedly polemical, using the same tactic of accusations of weak logic and feeble-mindedness which he had employed against al-Razi. Perhaps also a rejection of al-Tusi's own past, this text marks another stage in the development of his conviction of the superiority of philosophical thinking over religious dialectics.

Al-Tusi made several contributions to the field of metaphysical theology. The first attempt in this direction was an exposition of Isma'ili *qiyama* (resurrection) theology in his *Rawdat al-taslim (The Garden of Submission)*, but of more enduring consequence was his later Twelver work, the *Tajrid al-kalam (Abstract of Theology)*. This has been the subject of numerous commentaries down to the present century, the most important of which is the 'Allamah al-Hilli's *Kashf al-murad (Disclosing the Intention)*. After the *Tajrid*, practically all Imami theological works would be expressed in the terminology of metaphysics, with Mulla Sadra eventually achieving a comprehensive and lasting fusion.

3 Ethics, mathematics and the natural sciences

There are two main works in al-Tusi's ethical output, the *Akhlaq-i Muhtashami (Muhtashamean Ethics)* and the *Akhlaq-i Nasiri (The Nasirean Ethics)*, both written in Persian. The first of these was commissioned by the Isma'ili ruler (*muhtasham*) of Quhistan, Nasir al-Din 'Abd al-Rahman, who provided the outline and approved its contents but called in al-Tusi to do the major work because of the demands of his own political duties. This is scarcely more than a manual of ethical precepts, amply illustrated with quotations from the Qur'an, the Shi'i Imams and Greek sources. The *Akhlaq-i Nasiri*, the first 'edition' of which was dedicated to the same Nasir al-Din, is arranged as a work of philosophical ethics. Its divisions into three parts - ethics (*akhlaq*), domestic economics (*tadbir-e manzil*), politics (*siyasat-e mudun*) - set the pattern for subsequent works on practical philosophy in the Islamic tradition (see al-Dawani).

The first part on ethics is modelled on Ibn Miskawayh's *Tahdhib al-akhlaq (Cultivation of Morals)*, of which the work was initially commissioned to be merely a Persian translation (see Ibn Miskawayh). However, al-Tusi expands on Ibn Miskawayh both in the initial section on principles, mainly a theoretical treatment of psychology (the soul), and in his subsequent treatment of character and the virtues. This first part finishes with the addition of a section on the treatment of the vices as sicknesses of the soul, and of the cures to remedy them. The sources of the second part on domestic economics are the Arabic translation of Bryson's *Oikonomikos* and a text by Ibn Sina, his *Kitab al-siyasa (Book of Politics)*, while the third part, on politics, goes back to al-Farabi's *Kitab al-siyasa al-madaniyya (The Political Regime)* and *Fusul al-madani (Aphorisms of the Statesman)* (see al-Farabi). The last part contains an important section on the virtue of love (*mahabba*) as the cement of societies.

After al-Tusi joined Hülegü, he changed the introduction and conclusion to this work, excusing his previous praise of the Isma'ili leadership as the product of exigency. Moreover, he added that this was strictly a work of philosophy which transcended sectarian differences and was available to all. The work made available to Persian readers the Islamic ethical tradition taken from Greek philosophy but now incorporating Qur'anic material alongside the opinions of Plato and Aristotle. Justice explicitly comes to the fore as the supreme virtue running through all three parts of the book, implicitly linking it with Shi'i theology and the priority given in the latter to justice among the divine attributes; and philosophical ethics and the religious law are stated to be concerned with the same subject matter, thus affirming the intellect's capacity to view normative values in a way which could only have been acceptable at that time within Shi'i circles (see Ethics in Islamic philosophy).

Throughout his life al-Tusi was a prolific writer in mathematics and the natural sciences, and made advances in trigonometry, mathematics and astronomy. This aspect of his intellectual endeavour was eventually rewarded with the foundation of the Maraghah observatory. The result of the astronomical observations and calculations made there was the famous tables of the *Zij-e Ilkhani* (in Persian, but also translated into Arabic). Prior to Maraghah, the rational sciences had been cultivated by individuals with (or without) private patronage, the schools in Islam being devoted almost entirely to the law and dismissive of, if not actually hostile to philosophical activity. The setting up of the observatory and the institutionalization of the rational sciences created a demand for teaching materials, and al-Tusi was himself the author of a number of recensions (*tahrir*) of scientific texts as well as summaries and abridgements of theological, logical, and philosophical texts, clearly intended to supply this teaching need. Al-Tusi's lasting influence can be seen in the subsequent surge of activity in the rational sciences in the Islamic east, as well as in their gradual absorption into religious education, which in turn affected the development of theology, particularly among Shi'i scholars (see Science in Islamic philosophy).

JOHN COOPER

List of works

(1235, 1265) *Akhlaq-i Nasiri (The Nasirean Ethics)*, trans. G.M. Wickens, London: George Allen & Unwin, 1964. (An excellent, meticulous translation of the *Akhlaq-e Nasiri*, with a brief introduction and notes.)

(1242) *Rawdat al-taslim (The Garden of Submission)*, trans. C. Jambet, *La convocation d'Alamût: somme de philosophie ismaélienne (Radat al-taslîm: Le jardin de vraie foi)*, Lagrasse and Paris: Éditions Verdier and Éditions UNESCO, 1996.(A work of Isma'li theology.)

(1244-5) *Asas al-iqtibas (The Ground for the Acquisition of Knowledge)*, ed. M. Radawi, Tehran: Tehran University Press, 1947.(Al-Tusi's major logical text, in Persian.)

(probably after 1246) *Sayr wa suluk (Contemplation and Action)*, ed. and trans. S.J.H. Badakhchani, London: Institute for Ismaili Studies, 1997.(This is the autobiography which al-Tusi wrote during his stay with the Isma'ilis, and is untinged with the complaints which he later made of this period in his life.)

(before 1258) *Sharh al-Isharat (Commentary on the Isharat)*, ed. S. Dunya in Ibn Sina, *al-Isharat wa-'l-tanbihat*, Cairo: Dar al-Ma'arif, 1957-60, 4 parts, 3 vols in 2; also in Ibn Sina, *al-Isharat wa-'l-tanbihat*, Tehran: Matba'at al-Haydari, 1957-9, 3 vols.(Both these editions contain al-Tusi's commentary as parts of Fakhr al-Din al-Razi's commentary, to which al-Tusi is responding. The Tehran edition also contains Qutb al-Din al-Razi's commentary, which sets out to adjudicate between al-Tusi and al-Razi.)

al-Tusi (probably before 1270-1) *Tajrid al-kalam (Abstract of Theology)*.(The text of this, al-Tusi's major theological work (also known as *Tajrid al-'aqa'id* and *Tajrid al-i'tiqad*), can be found in the commentary by his pupil Hasan ibn Yusuf ibn al-Mutahhar al-Hilli, *Kashf al-murad fi sharh tajrid al-i'tiqad*, Qum: Jama'at al-Mudarrisin, no date.)

Ambedkar, Bhimrao Ramji (1891-1956)

Bhimrao Ramji Ambedkar was a statesman, scholar, human rights advocate, educator, barrister, first law minister of the Republic of India and architect of its constitution. Born into the untouchable Mahar subcaste, he became the widely revered leader of India's more than 100 million hereditary outcastes, the social and psychological emancipation of whom remained his lifelong objective. Strongly influenced by Anglo-American liberalism and pragmatism, Ambedkar was a staunch constitutionalist and social democrat. Locating the source of untouchability within the caste system itself, he became a militant critic of Hinduism, eventually affirming Buddhism as the universal ethical teaching that he felt could lead all of India into modernity.

Sponsored by a socially progressive Indian mahārāja, Ambedkar became the first of his outcaste background to complete a full course of postgraduate study, receiving a Ph.D. from Columbia University and a D.Sc. from the University of London in addition to qualifying for the bar from Gray's Inn, London.

Ambedkar drew on both Indian and Western sources to formulate his social philosophy. Early in life he identified the Buddha, Kabīr and JyotibāPhule as his principal preceptors: the Buddha (sixth-fifth century BC) because of his programme of ethical and spiritual cultivation including an explicit critique of the caste system; the radical poet-saint and mystic Kabīr (fifteenth century) for his anti-Brahmanic, egalitarian spirituality; and the militant educationalist Phule (1828-90) as the Shudra founder of the ninteenth-century non-Brahman movement in Maharashtra that first coupled Western rationalism and liberalism with more traditional social and spiritual critiques of casteism and untouchability. Ambedkar was widely read in the modern classics of Western social and political theory and he was especially influenced by the faculty at Columbia University during his graduate period there from 1913-16. Through his contact with John Dewey, James Shotwell, Edwin Seligman, James Harvey Robinson, Franklin Giddings and Alexander Goldenweiser in particular, he acquired a pragmatic, even optimistic, conviction in the potential of democratic institutions to bring about social equality. Given Ambedkar's consequent commitment to constitutional democracy, it was inevitable that he would clash with Gandhi, rejecting both the latter's willingness to move outside the bounds of the legal process and also his patriarchal belief that emancipation of the Untouchables would result from a change of heart on the part of caste Hindus rather than from the political and ethical transformation of the Untouchables themselves (see Political philosophy, Indian).

A jurist and statesman more than a political philosopher, Ambedkar's chief intellectual contributions lay in the realm of social theory. His MA thesis revised prevailing sociological views regarding the origins of caste in India. It argued that caste discrimination arose not from race, colour, or occupation, but rather from the Brahmanic concept of endogamy-based ritual purity and pollution, a worldview subsequently adopted by other caste communities in imitation of the Brahmans. Later in his life he expanded this position with the provocative thesis linking the development of untouchability to Brahmanic oppression of Buddhist minorities beginning in the fifth century.

In assessing Ambedkar's social philosophy and his career as a statesman one must recognize three distinct but interlinked spheres of concern. He felt that India would not be fully liberated until its outcastes were emancipated and he further asserted that this emancipation must be legal, material and spiritual. Each of these three dimensions became the focus of successive, overlapping phases of his activities. His first object was to secure the legal status of equal rights for Untouchables and the illegality of traditional practices of caste discrimination that restricted access to water sources and other public facilities. This phase began with his early efforts in the 1920s and 1930s to organize *satyagraha* demonstrations and legal suits and culminated with his decisive role in bringing the new Indian constitution to ratification in 1949.

As an economist and sociologist he recognized that legal protection alone was not sufficient. Thus, his second sphere of concern focused on the material improvement of the Untouchables. Efforts to establish legally mandated reservations guaranteeing Untouchables access to the political and educational systems, the civil service and many public sector professions were crucial to this phase of Ambedkar's activity, but at its heart lay his recognition that change would come only when the Untouchables were able to take full advantage of these opportunities. This realization led him in 1945 to establish the People's Education Society. Its success has led to the introduction of over thirty institutions of higher education open to all castes, but was especially intended to help the

ex-Untouchables gain the education necessary for social advancement. In retrospect Ambedkar appears more successful as an educator than a politician: a fact evidenced by the recent emergence of a strong ex-Untouchable urban middle class and the flourishing of a vigorous and nationally influential *Dalit* (oppressed) literature movement in Marathi, Gujarati and other Indian languages.

The third concern that Ambedkar thought should be addressed went beyond his efforts to secure legal and material advancement for his people. He believed that educational economic advancement would be meaningless unless it was coupled with ethical and spiritual development. It was in Buddhism that he found an indigenous Indian source for completing his vision of emancipation, a source he felt was compatible with his Western rationalism and egalitarianism. The importance of this third element in his thought has been minimized by the more politically minded of his successors, some of whom feel that renouncing Hinduism is sufficient to break the stigma of caste. This was not Ambedkar's view. Attracted to the Buddha's compassionate injunction to work for the welfare of the many as early as 1908, Ambedkar swore in 1935 that although he had been born a Hindu he would not die a Hindu. By 1950 he had come to believe that it was only through Buddhism that the Untouchables would gain the self-respect and self-reliance necessary to realize fully their own advancement. In 1956 just weeks before his untimely death, he inaugurated a mass conversion movement that has subsequently attracted more than 10 million new Indian Buddhists.

Ambiguity

A word, phrase or sentence is ambiguous if it has more than one meaning. The word 'light', for example, can mean not very heavy or not very dark. Words like 'light', 'note', 'bear' and 'over' are lexically *ambiguous. They induce ambiguity in phrases or sentences in which they occur, such as 'light suit' and 'The duchess can't bear children'. However, phrases and sentences can be ambiguous even if none of their constituents is. The phrase 'porcelain egg container' is* structurally *ambiguous, as is the sentence 'The police shot the rioters with guns'. Ambiguity can have both a lexical and a structural basis, as with sentences like 'I left her behind for you' and 'He saw her duck'.*

The notion of ambiguity has philosophical applications. For example, identifying an ambiguity can aid in solving a philosophical problem. Suppose one wonders how two people can have the same idea, say of a unicorn. This can seem puzzling until one distinguishes 'idea' in the sense of a particular psychological occurrence, a mental representation, from 'idea' in the sense of an abstract, shareable concept. On the other hand, gratuitous claims of ambiguity can make for overly simple solutions. Accordingly, the question arises of how genuine ambiguities can be distinguished from spurious ones. Part of the answer consists in identifying phenomena with which ambiguity may be confused, such as vagueness, unclarity, inexplicitness and indexicality.

1 Types of ambiguity

Ambiguity is a property of linguistic expressions. A word, phrase or sentence is ambiguous if it has more than one meaning. Obviously this definition does not say what meanings are or what it is for an expression to have one (or more than one). For a particular language, this information is provided by a grammar, which systematically pairs forms with meanings, ambiguous forms with more than one meaning (see Semantics).

There are two types of ambiguity, *lexical* and *structural*. Lexical ambiguity is by far the more common. Everyday examples include nouns like 'chip', 'pen' and 'suit', verbs like 'call', 'draw' and 'run' and adjectives like 'deep', 'dry' and 'hard'. There are various tests for lexical ambiguity. One test is having two unrelated antonyms, as with 'hard', which has both 'soft' and 'easy' as opposites. Another is the conjunction reduction test. Consider the sentence, 'The tailor pressed one suit in his shop and one in the municipal court'. Evidence that the word 'suit' (not to mention 'press') is ambiguous is provided by the anomaly of the 'crossed interpretation' of the sentence, on which 'suit' is used to refer to an article of clothing and 'one' to a legal action.

The above examples of ambiguity are each a case of one word with more than one meaning. However, it is not always clear when we have only one word. The verb 'desert' and the noun 'dessert', which sound the same but are spelled differently, count as distinct words (they are homonyms). So do the noun 'bear' and the verb 'bear', even though they not only sound the same but are spelled the same. These examples may be clear cases of homonymy, but what about the noun 'respect' and the verb 'respect' or the preposition 'over' and the adjective 'over'? Are the members of these pairs homonyms or different forms of the same word? There is no general consensus on how to draw the line between cases of one ambiguous word and cases of two homonymous words. Perhaps the difference is ultimately arbitrary.

Sometimes one meaning of a word is derived from another. For example, the cognitive sense of 'see' (to see that something is so) seems derived from its visual sense. The sense of 'weigh' in 'He weighed the package' is derived from its sense in 'The package weighed two pounds'. Similarly, the transitive senses of 'burn', 'fly' and 'walk' are derived from their intransitive senses. Now it could be argued that in each of these cases the derived sense does not really qualify as a second meaning of the word but is actually the result of a lexical operation on the underived sense. This argument is plausible to the extent that the phenomenon is systematic and general, rather than peculiar to particular words. Lexical semantics has the task of identifying and characterizing such systematic phenomena. It is also concerned to explain the rich and subtle semantic behaviour of common and highly flexible words like the verbs 'do' and 'put' and the prepositions 'at', 'in' and 'to'. Each of these words has uses which are so numerous yet so closely related that they are often described as 'polysemous' rather than ambiguous.

Structural ambiguity occurs when a phrase or sentence has more than one underlying structure, such as the phrases 'Tibetan history teacher', 'a student of high moral principles' and 'short men and women', and the sentences 'The

girl hit the boy with a book' and 'Visiting relatives can be boring'. These ambiguities are said to be structural because each such phrase can be represented in two structurally different ways, for example '[Tibetan history] teacher' and 'Tibetan [history teacher]'. Indeed, the existence of such ambiguities provides strong evidence for a level of underlying syntactic structure (see Syntax). Consider the structurally ambiguous sentence, 'The chicken is ready to eat', which could be used to describe either a hungry chicken or a cooked chicken. It is arguable that the operative reading depends on whether or not the implicit subject of the infinitive clause 'to eat' is tied anaphorically to the subject ('the chicken') of the main clause.

It is not always clear when we have a case of structural ambiguity. Consider the elliptical sentence, 'Perot knows a richer man than Trump'. It has two meanings, that Perot knows a man who is richer than Trump and that Perot knows a man who is richer than any man Trump knows, and is therefore ambiguous. But what about the sentence 'John loves his mother and so does Bill'? It can be used to say either that John loves John's mother and Bill loves Bill's mother or that John loves John's mother and Bill loves John's mother. But is it really ambiguous? One might argue that the clause 'so does Bill' is unambiguous and may be read unequivocally as saying in the context that Bill does the same thing that John does, and although there are two different possibilities for what counts as doing the same thing, these alternatives are not fixed semantically. Hence the ambiguity is merely apparent and better described as semantic underdetermination.

Although ambiguity is fundamentally a property of linguistic expressions, people are also said to be ambiguous on occasion in how they use language. This can occur if, even when their words are unambiguous, their words do not make what they mean uniquely determinable. Strictly speaking, however, ambiguity is a semantic phenomenon, involving linguistic meaning rather than speaker meaning (see Meaning and communication). Generally when one uses ambiguous words or sentences, one does not consciously entertain their unintended meanings, although there is psycholinguistic evidence that when one hears ambiguous words one momentarily accesses and then rules out their irrelevant senses. When people use ambiguous language, generally its ambiguity is not intended. Occasionally, however, ambiguity is deliberate, as with an utterance of 'I'd like to see more of you' when intended to be taken in more than one way in the very same context of utterance.

2 Ambiguity contrasted

It is a platitude that what your words convey 'depends on what you mean'. This suggests that one can mean different things by what one says, but it says nothing about the variety of ways in which this is possible. Semantic ambiguity is one such way, but there are others: homonymy (mentioned in §1), vagueness, relativity, indexicality, nonliterality, indirection and inexplicitness. All these other phenomena illustrate something distinct from multiplicity of linguistic meaning.

An expression is vague if it admits of borderline cases (see Vagueness). Terms like 'bald', 'heavy' and 'old' are obvious examples, and their vagueness is explained by the fact that they apply to items on fuzzy regions of a scale. Terms that express cluster concepts, like 'intelligent', 'athletic' and 'just', are vague because their instances are determined by the application of several criteria, no one of which is decisive.

Relativity is illustrated by the words 'heavy' and 'old' (these are vague as well). Heavy people are lighter than nonheavy elephants, and old cats can be younger than some young people. A different sort of relativity occurs with sentences like 'Jane is finished' and 'John will be late'. Obviously one cannot be finished or late *simpliciter* but only finished with something or late for something. This does not show that the words 'finished' and 'late' are ambiguous (if they were, they would be ambiguous in as many ways as there are things one can be finished with or things one can be late for), but only that such a sentence is semantically underdeterminate - it must be used to mean more than what the sentence means.

Indexical terms, like 'you', 'here' and 'tomorrow', have fixed meaning but variable reference. For example, the meaning of the word 'tomorrow' does not change from one day to the next, though of course its reference does (see Demonstratives and indexicals).

Nonliterality, indirection and inexplicitness are further ways in which what a speaker means is not uniquely determined by what their words mean (see Speech acts §4). They can give rise to unclarity in communication, as might happen with utterances of 'You're the icing on my cake', 'I wish you could sing longer and louder', and 'Nothing is on television tonight'. These are not cases of linguistic ambiguity but can be confused with it because

speakers are often said to be ambiguous.

3 Philosophical relevance

Philosophical distinctions can be obscured by unnoticed ambiguities. So it is important to identify terms that do double duty. For example, there is a kind of ambiguity, often described as the ‘act/object’ or the ‘process/product’ ambiguity, exhibited by everyday terms like ‘building’, ‘shot’ and ‘writing’. Confusions in philosophy of language and mind can result from overlooking this ambiguity in terms like ‘inference’, ‘statement’ and ‘thought’. Another common philosophical ambiguity is the type/token distinction. Everyday terms like ‘animal’, ‘book’ and ‘car’ apply both to types and to instances (tokens) of those types. The same is true of linguistic terms like ‘sentence’, ‘word’ and ‘letter’ and of philosophically important terms like ‘concept’, ‘event’ and ‘mental state’ (see Type/token distinction).

Although unnoticed ambiguities can create philosophical problems, ambiguity is philosophically important also because philosophers often make spurious claims of it. Indeed, the linguist Charles Ruhl (1989) has argued that certain ostensible ambiguities, including act/object and type/token, are really cases of lexical underdetermination. Kripke (1977) laments the common stratagem, which he calls ‘the lazy man’s approach in philosophy’, of appealing to ambiguity to escape from a philosophical quandary, and Grice (1967) urges philosophers to hone ‘Modified Occam’s Razor: senses are not to be multiplied beyond necessity’. He illustrates its value by shaving a sense off the logical connective ‘or’, often thought to have both an inclusive and exclusive sense. Grice argues that, given its inclusive meaning, its exclusive use can be explained entirely on pragmatic grounds (see Implicature §6; Pragmatics §12). Another example, prominent in modern philosophy of language, is the ambiguity alleged to arise from the distinction between referential and attributive uses of definite descriptions (see Descriptions §5). Less prominent but not uncommon is the suggestion that pronouns are ambiguous as between their anaphoric and deictic use. So, for example, it is suggested that a sentence like ‘Oedipus loves his mother’ has two ‘readings’ - that is, it is ambiguous - because it can be used to mean either that Oedipus loves his own mother or that Oedipus loves the mother of some contextually specified male. However, this seems to be an insufficient basis for the claim of ambiguity. After all, being previously mentioned is just another way of being contextually specified. Accordingly, there is nothing semantically special in this example about the use of ‘his’ to refer to Oedipus.

Claims of structural ambiguity can also be controversial. Of particular importance are claims of scope ambiguity, which are commonly made but rarely defended (see Scope). A sentence like ‘Everybody loves somebody’ is said to exhibit a scope ambiguity because it can be used to mean either that for each person, there is somebody that that person loves or (however unlikely) that there is somebody that everybody loves. These uses may be represented, respectively, by the logical formulas ‘ $(\forall x)(\exists y)(\mathrm{L}xy)$’ and ‘ $(\exists y)(\forall x)(\mathrm{L}xy)$’. It is generally assumed that, because different logical formulas are needed to represent the different ways in which an utterance of such a sentence can be taken, the sentence itself has two distinct logical forms (see Logical form). Sustaining this claim of ambiguity requires identifying a level of linguistic description at which the sentence can be assigned two distinct structures. Some grammarians have posited a level of LF, corresponding to what philosophers call logical form, at which relative scope of quantified noun phrases may be represented. However, LF of this kind does not explain scope ambiguities that philosophers attribute to sentences containing modal operators and psychological verbs, such as ‘The next president might be a woman’ and ‘Ralph wants a sloop’. An utterance of such a sentence can be taken in either of two ways, but it is arguable that the sentence is not ambiguous but merely semantically underdeterminate with respect to its two alleged ‘readings’.

Notwithstanding the frequency in philosophy of unwarranted and often arbitrary claims of ambiguity, it cannot be denied that some terms really are ambiguous. The nouns ‘bank’ and ‘suit’ are clear examples and so are the verbs ‘bank’ and ‘file’. Philosophers sometimes lament the prevalence of ambiguity in natural languages and yearn for an ideal language in which it is absent. But ambiguity is a fact of linguistic life. Despite the potentially endless supply of words, many words do double duty or more. And despite the unlimited number of sentences, many have several meanings and their utterance must be disambiguated in the light of the speaker’s likely intentions.

American philosophy in the 18th and 19th centuries

Jonathan Edwards, the first great American philosopher, interpreted Calvinist theology within the newer framework of Newtonian physics and Lockean empiricism in his Freedom of the Will (1754). However, he was all but forgotten by the end of the eighteenth century, when political rather than theological issues held centre stage. In the years leading up to the American Revolution, the moral sense theory of Shaftesbury and Hutcheson, Lockean liberalism and classical republican theory all contributed to the thought of Thomas Jefferson, James Madison and others who saw themselves as parties to a contract with a monarch, defenders of the rights of humans, and members of a new and virtuous republic.

In the early nineteenth century, Scottish common sense realism prevailed in the universities, but the most original and influential philosophical writing came from the communities of the transcendentalists. Emerson and Thoreau developed philosophies of life, language, knowledge and being in writings drawing on the Greek and Roman classics, English and German Romanticism, Christianity, and non-Western thought. After the Civil War (1861-5), a series of clubs in the East and Midwest, and the new Journal of Speculative Philosophy made Hegel more accessible to Americans; while in Cambridge, Massachusetts, the 'Metaphysical Club' of William James, Charles Peirce, Chauncey Wright and Oliver Wendell Holmes Jr became the birthplace of pragmatism.

The last quarter of the nineteenth century saw the professionalization of American philosophy: new graduate departments at Harvard and Johns Hopkins, professional journals, and state-supported universities in the Midwest building non-denominational departments of philosophy. By the end of the century, James had published his vast Principles of Psychology (1890) and enunciated a version of pragmatism; Peirce had produced an outpouring of writing on pragmatism, scientific method, logic, semiotics and metaphysics; and Josiah Royce and John Dewey were launched on influential academic careers.

1 Colonial America

The early Puritan communities were sustained by an intense and continuous involvement with abstract ideas. To the Harvard undergraduate studying Ramus' *Dialectica*, as to the townsman poring over Calvin's *Institutes*, questions concerning conversion and sanctification were understood to lie at the heart of New England covenant theology, and these in turn were inseparable from a set of problems in what we now call epistemology, ontology and ethics or moral psychology.

In the immediate background of New England Puritan divinity lay an unstable synthesis of medieval scholasticism and Calvinist theology, with what Calvin himself called the 'awful decree' of predestination at its centre. This synthesis would be exploded by Newton's *Principia* and Locke's *Essay Concerning the Human Understanding*, the two works together regarded in England's American colonies, as in England and Europe, as heralding the advent of a New Science and a new philosophical empiricism.

The great monument of the encounter between covenant theology and the new empiricism is Jonathan Edwards' *Freedom of the Will* (1754), deservedly famous for its apparently effortless reinterpretation of Calvinist doctrine within the newer framework of Newtonian physics - especially the new atomic or 'corpuscular' theory of matter - and Lockean sensationalism. This was the first significant work of philosophy produced in America, and the first American work in any category to have an important influence on European thought. Yet, although certain elements of his metaphysics were absorbed into Concord Transcendentalism, Edwards' influence on American philosophy was otherwise virtually extinct by the end of the eighteenth century (see Edwards, J.).

After Edwards, 'abstract' discourse in America - that is, discourse concerned with ideas and principles - shifted from a theological to a political register, as it did also in Europe (for example, in Montesquieu's *Lettres Persanes* and Voltaire's *Lettres Philosophiques*). In European political theory, a new sense of cultural relativity or 'climate of contingency' is reflected in the contract theories of Hobbes, Locke and Rousseau: consent is the necessary basis for the polity, and the particular form of a society may vary according to cultural and historical contingencies. According to 'Lockean liberal' interpretations of the political philosophy of the Founders (Hartz, Boorstin), the Continental Congress applied the principles of Locke's *Two Treatises on Civil Government* to their own case in declaring their independence from Britain: the monarch had violated his contract with the people, so the

arrangement between them was dissolved.

The Federalist Papers (1787-8) of John Madison and Alexander Hamilton (with some assistance from John Jay) constitute an extraordinary intervention of philosophy in the historical process, as they were written for a New York newspaper in the period when the Constitution was being voted on in the state legislatures. In the background of this and other American political documents of the late eighteenth century lies a sea of European ideas and their American inflections, including not just Lockean liberalism, but the moral sense theory of Shaftesbury and Hutcheson, and classical republican theory (deriving ultimately from Aristotle and Polybius via Machiavelli, Montesquieu and the English 'Country party' of Bailyn, Pocock and Dowling). Classical republican theory, with its vocabulary of 'luxury' and 'corruption' as opposed to 'virtue', allowed the American colonists to think of themselves as returning to something like the 'virtuous' state of ancient Rome. Moral sense theory provided an idea central to many revolutionary documents: that all human beings are possessed of a 'moral sense' that discerns right from wrong in the same way as the ear hears a dissonance in music (see Moral sense theories).

It was in fact the transmutation of moral sense theory into the common sense epistemology of Thomas Reid, Dugald Stewart and Sir William Hamilton that became the dominant philosophy taught at American universities from the late eighteenth century and through much of the nineteenth century. These writers offered a defence of direct perception against the scepticism of Hume that, in the hands of such teachers as John Witherspoon of Princeton (appointed in 1766), or Levi Hedge, the first professor of philosophy at Harvard (1792), could be seen as 'deist' or 'Christian'. God created a material world, these writers held, which we by our ingenuity and careful observation can know and improve. Witherspoon, a conservative Scottish Presbyterian who became a signatory of the Declaration of Independence, taught that moral questions could be investigated scientifically, and argued against radical scepticism on the ground that we know our experiential errors by means of other experiences. His *Lectures on Moral Philosophy and Eloquence* (1800) became a standard college text. Scots common sense theory helped make empiricism and science orthodox within the universities, while in its realism and insistence that relations are perceived, it anticipated doctrines of Peirce and James (see Common-sense ethics; Common Sense School).

2 19th century philosophy

The most original and influential early nineteenth century philosophical writers arose not in the universities, however, but among the Concord Transcendentalists. This group included Amos Bronson Alcott (1799-1888), Frederick Henry Hedge (1805-90), George Ripley (1802-80), Ralph Waldo Emerson (1803-82), Margaret Fuller (1810-50) and Henry David Thoreau (1817-62). Among these, Emerson and Thoreau stand out for their power as writers, and for their influence on such subsequent philosophers as James, Dewey, Nietzsche, and Ghandi.

Emerson enjoyed a highly visible career as a lecturer and writer. His sources include the classical philosophy he studied at Harvard, English and German Romantic poetry and philosophy, Hinduism and other non-Western philosophies and, of course, Christianity. Emerson's first book, *Nature* calls for a new 'original relation to the universe' (Emerson 1836). His controversial *'Divinity School Address'* (1838) condemns the 'Monster' of historical Christianity and urges the divinity graduates to find their own original natures, without which they can offer nothing to others. One makes the most sense to others, Emerson holds, by diving deeply into one's own heart. Emerson's *First Series* (1841) and *Second Series* (1844) of essays offer striking aphorisms and powerful paragraphs advocating a life of 'self-reliance', expanding 'circles', deep-seeing 'intellect', and balanced 'experience'. *Representative Men* (1850) and *The Conduct of Life* (1860) are important later works.

Thoreau thought of philosophy as a practice: a life of 'simplicity, independence, magnanimity, and trust' (Thoreau 1854). *Walden* is a record of that practice, based on two years spent living in the woods near Concord, Massachusetts, and offers a series of reflections on nature and human life. Thoreau finds the mass of men and women living 'lives of quiet desperation', driving themselves like slaves. In *Walden*'s long opening chapter on Economy, Thoreau construes his life at Walden as an 'experiment' to show how little is really necessary for life and, by contrast, how needlessly complex most people's lives happen to be. Later chapters blend descriptions of Walden Pond with reflections on the peculiar power of literature - 'the work of art nearest to life itself' (Thoreau 1854), on reading, vegetarianism, spring, ice, living in the present and neighbourliness. Thoreau's other works include his essays 'Walking' (1862), and the influential 'Civil Disobedience' (1849).

After the Civil War (1861-5), two of the many philosophical clubs scattered throughout the East and Midwest played a special role in the development of American philosophy. The 'St. Louis Hegelians' were led by William Torrey Harris (1835-1909) and Hans Conrad Brokmeyer (1826-1906). Brokmeyer emigrated to the US from Prussia in 1844, practised law, and eventually became lieutenant governor of Missouri. A leader in the German community, he worked on a translation of Hegel's *Logic*, which circulated in manuscript. Harris, a native of Connecticut who left Yale in his junior year, taught school in St. Louis and eventually became United States Commissioner of Education. He studied Bronson Alcott and Emerson, Goethe and Victor Cousin; with Brokmeyer, he founded the St. Louis Philosophical Club in 1866 and *The Journal of Speculative Philosophy* in 1867. The latter was the first technical philosophical journal in the USA or England, and published papers not only by US and English Hegelians such as Harris and Edward Caird, but by Peirce, Dewey, and William James (parts of *The Principles of Psychology* were first published in the journal). A few weeks of joint philosophical efforts among the Midwest and Eastern 'idealists' and the university professors of philosophy occurred during the summers of 1879-83, when the Concord School, founded by Emerson and Alcott, enlisted Harris, William James, Benjamin Peirce (Charles' father, a Harvard professor of mathematics), James McCosh (last of the Princeton Scottish realists), George Sylvester Morris (the Hegelian teacher of Dewey and Royce at Hopkins), and Emerson himself as lecturers.

The Cambridge Metaphysical Club had its origins in James' 1868 proposal to Oliver Wendell Holmes Jr (1841-1935) that they should establish 'a philosophical society to have regular meetings and discuss none but the very tallest and broadest questions' (Kuklick 1977: 47). By 1871 the club centred around six men, all with Harvard degrees: James and Holmes, Charles Peirce, Chauncey Wright, Nicholas St. John Green, and Joseph Bangs Warner. Green, a Boston attorney, introduced the thought of the British psychologist and philosopher Alexander Bain (1818-1903), particularly his definition of belief as 'that upon which a man is prepared to act'. Wright was a mathematician employed by the *Nautical Almanac* as a 'calculator', and an occasional lecturer in psychology and physics at Harvard. He applied Darwin's evolutionary theory to the development of consciousness in such publications as 'Evolution of Consciousness' (1873), maintaining that consciousness comes about not from any new capacity but from using an old capacity - forming images - in a new way (see Evolution, theory of).

3 Classical American philosophy

Although Wright was regarded as the leader of the Metaphysical Club, Peirce and then James proved to be its most significant members. Peirce seemed destined for intellectual achievement from an early age, and he began publishing papers on logic and semiotics in the 1860s. 'Some Consequences of Four Incapacities' (1868) contains the first published statement of his view that all thought is in signs, and 'On a New List of Categories' (1867) a first statement of his categorial scheme. Peirce presented what came to be called 'the pragmatic maxim' to the Metaphysical Club in an 1872 version of his paper 'How to Make Our Ideas Clear' (1878): 'Consider what effects, which might conceivably have practical bearing, we conceive the object of our conception to have. Then our conception of these effects is the whole of our conception of the object'. In 'The Fixation of Belief' (1877) Peirce considers four ways in which we come to form beliefs: by authority, tenacity (holding on to the beliefs one already has), rationality, or science. Only science, Peirce argues, has the integrity that comes from allowing itself to be determined by 'some external permanency—by something upon which our thinking has no effect' (Peirce 1877).

Peirce worked at the US Coast and Geodetic Survey in the 1860s and 1870s, and was appointed to a lectureship in logic in the new Graduate School at Johns Hopkins in 1879; but he was dismissed in 1884 and, despite occasional lectures at Harvard arranged by William James, never taught regularly again. In a series of papers in *The Monist* in the early 1890s he developed a system of metaphysics according to which absolute chance operates in the universe, but so does 'evolutionary love'; and matter is 'effete mind'. Central to Peirce's many writings was the idea of three categories, Firstness, Secondness, and Thirdness. He held that all signs are 'thirds': besides a purely linguistic element and an object of reference, they contain an irreducible element of interpretation.

William James studied chemistry in the Lawrence Scientific School at Harvard in the 1860s, and biology with Louis Agassiz (including fifteen months in Brazil), receiving his degree in medicine in 1869. He began teaching anatomy and physiology in 1872, and became an assistant professor of psychology in 1875, when he established the first psychological laboratory in America. James' earliest publications did not report research in physiology or the new psychophysics, however, but were a series of critiques of books on science, philosophy and culture. He

argues in ‘The Sentiment of Rationality’ (1879), for example, that reason is a passion, and at the end of ‘Remarks on Spencer’s Definition of Mind as Correspondence’ (1878) he anticipates the voluntaristic pragmatism of his later works:

> The knower is not simply a mirror floating with no foot-hold anywhere, and passively reflecting an order that he comes upon and finds simply existing. The knower is an actor, and co-efficient of the truth on one side, whilst on the other he registers the truth which he helps to create.
>
> (James 1878: 21)

James’ masterpiece, *The Principles of Psychology* (1890) gathers and integrates his writings of the 1870s and 1880s in a one-thousand-page work of physiology, psychology, and philosophy. The book became a standard text in newly established psychology programmes (especially in its shortened form), and influenced philosophers as diverse as Edmund Husserl (by its phenomenological description) and Bertrand Russell (by its distinction between knowledge by acquaintance and by description - see Knowledge by acquaintance and description). James introduces the ideas of the stream of thought and the ‘vague’ or ‘fringe’ areas of consciousness, in opposition to the discrete atomic sensations of traditional British empiricism. He stresses the importance of attention and habit in our mental life, and offers a theory of the emotions as responses to, rather than causes of, emotional behaviour. James’ moral outlook appears throughout the *Principles* and indeed throughout his philosophy, but is particularly explicit and prominent in the collections of papers, some from as early as the 1870s, that he published as *The Will to Believe and Other Essays in Popular Philosophy* (1896).

Although he credited Peirce with originating pragmatism, a lecture James gave at the University of California at Berkeley in 1898 entitled ‘Philosophical Conceptions and Practical Results’, contains the first published use of the term. Pragmatism, for James, is the view that ‘the effective meaning of any philosophic proposition can always be brought down to some particular consequence, in our future practical experience, whether active or passive’. He credits ‘English-speaking philosophers’ such as Locke and Berkeley with introducing the pragmatic ‘custom of interpreting the meaning of conceptions by asking what difference they make for life’, as Berkeley did when he found the ‘cash-value’ of matter to lie solely in our sensations.

Josiah Royce was brought up in the California goldrush town of Grass Mountain, studied English at Berkeley and philosophy in Germany. At Johns Hopkins from 1876 to 1878, he studied with George Sylvester Morris, a scholar of German philosophy and a proponent of T.H. Green. Receiving his Ph.D. in 1878, Royce taught English at Berkeley, then philosophy at Harvard, where he became a mainstay of the department. Royce introduced formal logic into the curriculum, and was a respected idealist opponent of James’ more naturalistic, open-ended pragmatism.

Royce’s early philosophical writing is in accord with his lifelong interests both in the history of philosophy, and in developing his own version of metaphysical idealism. His first book, *The Religious Aspect of Philosophy* (1885) argues for an Absolute Mind that contains all thoughts and their objects. In *The Spirit of Modern Philosophy: An Essay in the Form of Lectures* (1892), Royce traces ‘the rediscovery of the inner life’ from Spinoza to Kant, with special emphasis on Fichte - praised for his ‘beautiful waywardness’, the Romantic School, including Goethe, Novalis and Schelling, and Hegel. Royce argues, however, that the inner life is essentially public: that we live in our coherence or relationships with other people.

The third great pragmatist to emerge in the late nineteenth century, John Dewey, had neither the scientific background of Peirce and James, nor their association with Harvard. Dewey attended the University of Vermont in his home town of Burlington from 1875 to 1879. He studied not only the Scottish school but Kant and Hegel with the university’s philosophy professor, H.A.P. Torrey (1837-1902). According to his own testimony, Dewey found in Hegel’s philosophy ‘an immense release, a liberation’ from a sense of divisions between self and world, soul and body, nature and God. Enrolling in the new graduate school at Johns Hopkins in 1882, he studied Hegel and Green with Morris, logic with Charles Peirce, and the newly emerging experimental psychology with G. Stanlely Hall (1844-1924). Appointed to a post at the University of Michigan in 1884, he taught there, with the exception of a year at Minnesota, till 1894 when he began teaching at the University of Chicago.

Dewey’s early papers argue for a reconciliation of Darwinism, Hegelian idealism and religion. Intelligence, Dewey asserts, is latent in evolving matter. In the 1890s Dewey called his synthesis of Hegelianism and science

'experimental idealism', but he gradually moved - as he says in the title of his autobiography - 'from absolutism to experimentalism'. His paper 'The Reflex Arc Concept in Psychology' (1896), presages his future instrumentalism and pragmatism in its attacks on the prevailing stimulus-response theory, which Dewey sees as preserving a sharp metaphysical and epistemological distinction between sensory stimulation and motor response. Stimulus and response are, Dewey argues, aspects of a basic 'sensorimotor coordination', a 'circuit' or 'continual reconstitution'. The sensorimotor coordination, like Dewey's later 'problem situation', shares with Hegelian logic the idea of a progression of temporally evolving wholes.

Dewey's educational philosophy also took shape in the 1890s, when he was a professor not only of philosophy but also of psychology and pedagogy. He worked with high school faculty in Michigan, and with the Laboratory School at Chicago. In 'Interest in Relation to the Training of the Will' (1896), Dewey argues that because interest is a complex of felt worth and incipient action, when we are genuinely interested in something, we do not have to will to do it. Only through such genuine interest, which 'marks the annihilation of the distance between the person and the materials and results of his action', can the will be effectively trained (Dewey 1896). In 'My Pedagogic Creed' (1897), Dewey maintains that education is 'a process of living and not a preparation for future living', and that therefore it must seek 'forms of life that are worth living for their own sake' (Dewey 1897).

Ammonius, son of Hermeas (*c.* AD 440-521)

The Greek philosopher Ammonius, 'son of Hermeas' was an Alexandrian Neoplatonist. Educated by Proclus in Athens, he succeeded his father as head of the school in Alexandria, where he cultivated the tradition of learned commentary on Aristotle. Simplicius, Philoponus, Asclepius, Damascius and Olympiodorus ranked among his pupils.

Ammonius' calibre is hard to assess: important works like commentaries on Aristotle's *On the Heavens* and *Meteorology* and on Plato's *Gorgias*, as well as monographs on logic and theology, are lost. Moreover, with the exception of the commentary on Aristotle's *De interpretatione*, Ammonius left the task of writing out his lectures in full to his students. The case of Philoponus (§1) teaches us that they were not always entirely faithful to their master's ideas. Ancient sources praise Ammonius' abilities as a commentator, mathematician and astronomer. The extant works bearing his name suggest that he dedicated himself to sober, instructive and learned exegeses of Aristotelian treatises. Ammonius held strong views on the order in which these had to be studied, starting with logic, followed by ethics, physics, mathematics and finally theology (*On Aristotle's Categories* 5.31-6.8). In preparation for Aristotle's *Categories*, freshmen were exposed to Porphyry's *Introduction (Isagōgē)* to Aristotle's *Categories*, a logical treatise in which Porphyry discusses the five predicables (genus, species, differentia, property, and accident). Ammonius begins by telling his class what philosophy means to a Neoplatonist (*On Porphyry's Introduction* 2.22-5.27), emphasizing that philosophy assimilates the soul to the godhead, separates it from the body, and turns it towards the source and highest Neoplatonic principle, the One.

Ammonius accepts the common Neoplatonist contention that Plato and Aristotle substantially agree with one another. The *Categories* commentary begins with ten questions on Aristotle's philosophy, concerning the division and order of his works, their format and purpose, and, finally, the requisite character of a commentator. According to Ammonius, a commentator ought to adopt a position of critical independence: the truth must be preferred to what Aristotle says (8. 15-18).

In his commentary on Aristotle's *De interpretatione* Ammonius dedicates an excursus on Chapter 9 to the problem of future contingents. Although he upholds God's full knowledge of events past, present and future, he nevertheless rejects determinism. God sees all things in the way appropriate to him, that is, at once in a single, eternal now, but this does not entail that future events are determined. The whole commentary seems to owe much to Proclus' lectures.

In a lost theological treatise Ammonius argued that Aristotle's prime mover is both the final and the efficient cause of the universe. The suggestion that the ideas put forward in the treatise were motivated by the influence of Christianity and amounted to a substantial deviation from orthodox Neoplatonism has been plausibly rejected.

The *Metaphysics* commentary of Asclepius of Tralles as well as the early commentaries of Philoponus are greatly indebted to Ammonius, while the *De interpretatione* commentary influenced Aquinas by way of a Latin translation.

CHRISTIAN WILDBERG

List of works

It is impossible to date Ammonius' works with any accuracy, although it is likely that they were composed after the death of Proclus in 485 and before Philoponus assumed responsibility for publication in the decade beginning 510. Below they are listed in the order in which Ammonius intended them to be read.

Ammonius Hermeae (*c*.485-510) *On Porphyry's Introduction*, ed. A. Busse, *Commentaria in Aristotelem Graeca* IV 3, Berlin: Reimer, 1891.(A commentary on Porphyry's immensely influential introductory treatise on Aristotle's *Categories*.)

— (*c*.485-510) *On Aristotle's Categories*, ed. A. Busse, *Commentaria in Aristotelem Graeca* IV 4, Berlin: Reimer, 1895; trans. S.M. Cohen and G.B. Matthews, *Ammonius On Aristotle's Categories*, London: Duckworth, 1991. (The latter contains a concise introduction to Ammonius by Richard Sorabji.)

— (*c*.485-510) *On Aristotle's De interpretatione*, ed. A. Busse, *Commentaria in Aristotelem Graeca* IV 5, Berlin:

Reimer, 1897; partial trans. by D. Blank, *Ammonius' Commentary on On Interpretation*, London: Duckworth, 1995.(The commentary contains, on pages 129-39, an excursus on the divine knowledge of future contingents.)

— (*c*.485-510) *On Aristotle's Prior Analytics I*, ed. M. Wallies, *Commentaria in Aristotelem Graeca* IV 6, Berlin: Reimer, 1899.(Ammonius' lectures on Aristotle's theory of the syllogism.)

Amo, Anton Wilhelm (*c*.1703-56)

The first European-trained African philosopher, Amo pursued a scholarly career in jurisprudence and then in rationalist psychology, logic, and metaphysics. He trained at Halle, Wittenberg and Jena universities, and was influenced by the systems of Gottfried Wilhelm Leibniz and Christian von Wolff. While at Halle university, he wrote a pioneering legal dissertation on the application of Roman laws of slavery to Africans in Europe. Subsequently drawn to classical, biblical, and hermetic traditions that apotheosized a cultural continuity with ancient Africa, Amo focused his theoretical and practical concerns on the exterior world of international law and the interior world of deliberative intellectual acts.

The first African philosopher to study and teach in European universities, Anton Wilhelm Amo was born at Axim in Ghana to Nzima parents who were converted to Christianity by Dutch missionaries. Sent to The Netherlands at the age of four for a religious education, Amo was then transferred by representatives of the Dutch West India Company to the service of Anton Ulrich, Duke of Brunswick-Wolfenbüttel, whose Hapsburg court was the intellectual centre of early Enlightenment Germany. Through the Duke's patronage, which also supported G.W. Leibniz, Amo became proficient in Dutch, Hebrew, Greek, Latin, French and German and subsequently trained at the universities of Halle, Wittenberg and Jena in philosophy and jurisprudence.

As a student at Halle of Johann Peter von Ludewig, the Prussian diplomat and legal scholar, Amo prepared a dissertation, *De Jure Maurorum in Europa (On the Rights of Moors in Europe)* (1729), which utilized Roman law, hermeneutical and historiographical traditions to assert ancient prohibitions against enslaving Africans in Europe. He based his argument on legal rights ostensibly inherited from the early Christian era compacts between the Emperor Justinian and the indigenous kings of Roman north Africa. Amo's dissertation, extant only in digest form, represents one of the earliest scholarly responses to the growing legal dispute over slavery and the status of Africans as aliens in Europe during a period of expanding overseas slave colonies. It reflected the impact of rising African populations in metropolitan Europe and the Holy Roman Empire's disintegrating hegemony. The natural law principles and imperial precedents he employed paralleled those developed in Spain by the legal philosopher and theologian, Francisco de Vitoria, to oppose the 'Astral Empire' that Charles V planned to build, through slavery, at the outset of the New World conquest.

In philosophy, where Amo's interests inclined towards the Enlightenment rationalism of Leibniz and the related system of Christian Wolff, he specialized in pneumatology (rational psychology), logic and metaphysics. In rational psychology, he attempted to reconcile the tensions between Thomistic faculty psychology (see Aquinas, T. §1; Thomism §1) as it focused on the 'free' operations of intellect or will, and the more deterministic empirical psychology rooted in Lockean sensationalism (see Locke, J.) and medical physiology. In logic, he explored the nature of intellective acts such as contemplation, deliberation and reflection. Applying the mathematico-deductive method, Amo adopted precepts from the Port Royal semioticians, from modal logic and syllogistic methods, and from Christian Thomasius's 'practical logic' (see Thomasius, C.). In metaphysics, a religious attraction to the Cistercian, Carmelite and Franciscan spiritual orders immersed him in the study of Aristotle's *On the Soul* and the church fathers Tertullian and St Augustine, all of whom Amo traced through such modern thinkers as P. Melanchthon, R. Descartes, G.W. Leibniz, J. Le Clerc, and C. Wolff.

As a professor at Halle, Wittenberg and Jena, Amo lectured on topics that included Leibniz's principle of sufficient reason, the political thought of C. Wolff, J. Lorenz Fleischer's theories of the law of nature and the law of nations, and the decimal system. However, his interests were not confined to the formal university curriculum: as a private tutor, he conducted classes on several of the *ars hermetica* (the occult arts and sciences), including physiognomy, chiromancy, geomancy, natural astrology and decipherment. In 1738 as a member of various learned societies in Europe, including the academy of Flushing in The Netherlands, he published in Latin a compendium of his selected university lectures known as *Tractatus de Arte Sobrie et Accurate Philosophandi (A Treatise on the Art of Philosophizing Soberly and Accurately)*.

After the death of his academic patron, von Ludewig, Amo found his position in German academic and social circles increasingly tenuous and himself subject to racial rebuff. In 1747 he returned to Ghana and changed his profession to the honoured Ashanti vocations of goldsmith and seer. He died there in 1756. Since his philosophical

writings remained largely inaccessible until their recovery and dissemination in the twentieth century, Amo's historical influence lies primarily in his posthumous role in the international antislavery movement, where his example served to vindicate African moral and intellectual capacities. He is also known as a moral and intellectual vindicationist.

Analysis, nonstandard

Nonstandard analysis is an important application of mathematical logic to the rest of mathematics. Invented in 1960, it provided a long-sought-for rigorous justification for the use of infinitely large and infinitely small (infinitesimal) quantities in the differential and integral calculus, and the first sound canon for manipulating such quantities.

Consider the structure $\Re$ *of real numbers, that is, the set of real numbers together with operations and relations on them. We specify a formal language* $\mathcal{L}$*, which has names for all individual real numbers as well as for the operations and relations of* $\Re$*. We can then obtain an enlargement (a special kind of extension)* ${}^*\Re$ *('pseudo-* $\Re$*') of* $\Re$ *such that* ${}^*\Re$ *and* $\Re$ *have exactly the same formal properties: that is, properties expressible in* $\mathcal{L}$*. But, far from being merely a copy of* $\Re$*,* ${}^*\Re$ *has convenient properties not expressible in* $\mathcal{L}$*, which are not shared by* $\Re$*. In particular,* ${}^*\Re$ *has additional 'nonstandard' objects (which have no names in* $\mathcal{L}$*), some of which behave as infinite or infinitesimal quantities. If, using these novel objects and properties of* ${}^*\Re$*, we prove a proposition about* ${}^*\Re$ *that can be expressed in* $\mathcal{L}$*, then this proposition holds automatically also for* $\Re$*. Such 'nonstandard' proofs of results about* $\Re$ *are often easier and more intuitive than conventional proofs, which operate wholly within* $\Re$*.*

More generally, this method is applied to other structures, in virtually every branch of mathematics - including algebraic number theory, various branches of classical and modern analysis, probability theory and mathematical physics, to yield highly intuitive characterizations of various infinitary concepts, to simplify proofs and to provide new, efficient ways of generating mathematical constructs.

1 Historical background

The lineage of nonstandard analysis (NSA) goes back to Leibniz in two ways: first, his advocacy of the use of infinite and infinitesimal quantities in analysis was remarkably sophisticated for his time (see Analysis, philosophical issues in §1); and second, his vision of *lingua characteristica* and *calculus ratiocinator* foreshadowed the invention of mathematical logic, which was to provide the means for a rigorous justification of the use of those quantities.

Leibniz regarded infinite and infinitesimal quantities as 'useful fictions'; ideal (rather than metaphysically real) entities, whose status was similar to that of imaginary roots such as $\sqrt{-2}$, and whose adjunction to the standard real numbers serves to shorten proofs and aid mathematical invention in problems involving continuity.

Like complex (and, in particular, imaginary) numbers, infinite and infinitesimal quantities were freely used by mathematicians during the eighteenth century, despite known inconsistencies apparently inherent in this practice, which provoked protests by philosophical critics such as Berkeley.

During the nineteenth century, with the development of a more critical attitude to the foundations of analysis, the notions of the real and complex number structures were greatly clarified, and consistent canons were established for operating with these entities (see Numbers). However, no rigorous canon was found for the use of infinite and infinitesimal quantities. (Cantor, the inventor of set theory, thought that he could actually *prove* that no such canon was possible, and his view was accepted by Peano and others.) Instead, work on the foundations of analysis - by Bolzano, Weierstrass, Dedekind and others - followed a different route (whose viability had also been asserted by Leibniz): the 'delta-epsilon' method, whereby 'instead of the infinite or infinitely small, one takes [standard] quantities as large or as small as required to make the error smaller than [any] given error' (see Analysis, philosophical issues in §2).

By the twentieth century, the success of this method (in effect, an extension of Archimedes' method of exhaustion) had been so spectacular and its domination in pure mathematics so total, that Russell was merely expressing received opinion when he asserted that 'infinitesimals as explaining continuity must be regarded as unnecessary, erroneous, and self-contradictory' ([1903] 1937: 345). Nevertheless, the older, now officially discredited, method survived in 'lowbrow' (mainly applied) mathematics and - as a powerfully creative heuristic aid - in the 'underground' private deliberations of 'highbrow' mathematicians.

Before the advent of NSA, some isolated attempts were still made, in the face of received opinion, to provide a

rigorous justification for the use of infinite and infinitesimal quantities in analysis. None of these was fully successful, although Schmieden and Laugwitz (1958) came quite close. The successful solution of this problem, achieved by NSA, was to use tools produced by mathematical logic during the first half of the twentieth century, in particular, the notion of a nonstandard model. Skolem showed the existence of nonstandard models of axiomatic set theory (1923) and of arithmetic (1934), but for a long time such models were regarded by logicians as pathological 'monsters' rather than a serious object of study - let alone a useful tool. This attitude began to change in about 1949, and during the 1950s there was a growing body of research into the properties and inner make-up of nonstandard models of arithmetic. This set the stage for Abraham Robinson's invention, in the autumn of 1960, of NSA, which uses nonstandard models as an instrument.

2 Enlargements

The method consists in systematically exploiting the peculiar properties of an enlargement (a special kind of nonstandard extension) $^*\mathrm{U}$ (pronounced 'pseudo- U') of a mathematical structure U, in order to study U itself.

As a paradigmatic example, consider the structure $\Re$ whose domain of individuals is the set $\mathbb{R}$ of real numbers. Apart from the domain $\mathbb{R}$, $\Re$ has as constituents all relations and operations on this domain. Let $\mathcal{L}$ be a first-order formal language which can be interpreted in $\Re$: so that the domain $\mathbb{R}$ can be taken as the range of the variables of $\mathcal{L}$, and for each entity of $\Re$ - an individual real, or a relation among reals, or an operation on reals - $\mathcal{L}$ has a symbol intended as a name for that entity.

Using the 'compactness theorem', we can prove the existence of a structure $^*\Re$, satisfying two conditions. First, $^*\Re$ is an 'elementary extension' of $\Re$. Second ('weak saturation condition'), if Φ is any family of $\mathcal{L}$-formulas having one free variable x, which is finitely satisfiable in $\Re$ (that is, every finite subset of Φ is satisfied by some individual real), then Φ as a whole is satisfiable in $^*\Re$.

The elementary extension condition is tantamount to the following 'transfer principle': any $\mathcal{L}$-sentence is true (when interpreted) in $\Re$ if and only if it is true (when re-interpreted) in $^*\Re$.

Thus any property of $\Re$ that can be formalized by means of an $\mathcal{L}$-sentence is true also of $^*\Re$, and conversely. For example, many well-known arithmetical laws (such as the fact that $x + y = y + x$ for any reals *x* and *y*) are automatically transferred to the extended domain $^*\mathbb{R}$ of the structure $^*\Re$. Similarly, the fact that the relation denoted by '$<$' is a total (that is, linear) ordering of $\mathbb{R}$ also transfers to $^*\mathbb{R}$. In this sense, $\Re$ and $^*\Re$ have exactly the same formal properties.

The members of $^*\mathbb{R}$ are called '*reals' ('pseudo-reals'). Note that every (standard) real (that is, member of $\mathbb{R}$) is also a *real, but not conversely. A *real which does not belong to $\mathbb{R}$ is said to be 'nonstandard'.

As an illustration of the (weak) saturation condition, consider the family of all $\mathcal{L}$-formulas of the form $\mathbf{r} < \mathbf{x}$, where x is a variable (common to all these formulas) and r is any $\mathcal{L}$-constant denoting a real *r*. Clearly, this family of formulas is finitely satisfiable in $\mathbb{R}$, because for any finitely many reals $r_1, r_2, \ldots, r_n$ there is always another real greater than all of them. Hence by saturation there exists some - necessarily nonstandard - *real *s* such that $r < s$ for every real *r*. Such an *s*, being greater than all reals, is to be regarded as a 'positive infinite' quantity. Similarly, there are nonstandard 'negative infinite' *reals. The reciprocals of infinite *reals, as well as the real 0, are 'infinitesimals', which are smaller than all positive reals and greater than all negative ones.

If *s* and *t* are *reals such that $s - t$ is infinitesimal, we write '$s \approx t$' and say that *s* and *t* are 'infinitely close' to each other. In whimsical homage to Leibniz, the collection $\mu(r)$ of all *reals infinitely close to a given real *r* was termed by Robinson the 'monad' of *r*.

By referring to the entities of an enlargement $^*\Re$, many standard concepts of analysis receive intuitively appealing characterizations which, while being rigorous, are often strikingly similar to the definitions used (without rigorous justification) before the advent of the 'delta-epsilon' method. For example, let *f* be a real-valued function defined in the neighbourhood of a real *r*. Then *f* is continuous at *r* if and only if $f(s) \approx f(r)$ whenever $s \approx r$. Also, *f* is differentiable at *r* if and only if there is a unique real *d* such that

$\frac{f(r+\delta)-f(r)}{\delta} \approx d$

for every non-zero infinitesimal δ. This *d* is then the derivative of *f* at *r*.

Such nonstandard characterizations of standard concepts can be used to obtain nonstandard proofs of standard results concerning $\Re$ itself. NSA is ‘conservative’, in the sense that any standard result that can be proved using NSA can, at least in principle, be proved also by purely standard means. However, the nonstandard proof is often considerably shorter and more transparent - and therefore easier to construct - than a conventional standard proof. Moreover, as shown by Henson and Keisler (1986), NSA is essentially more powerful than traditional standard analysis. (See also Keisler 1994.)

The ideas outlined so far in connection with the first-order structure $\Re$ of reals apply quite generally to any first-order mathematical structure U. Any such U can be taken as the ‘ground’ structure: we can prove the existence of an enlargement ${}^{*}\mathrm{U}$ of U satisfying the same two conditions (elementary extension and weak saturation).

3 Higher-order and special enlargements

Modern analysis is largely concerned with higher-order entities such as arbitrary sets of reals, sets of real-valued functions, sets of sets of functions, sets of sets of reals, functions from sets of reals to sets of reals, and so on.

To apply NSA in this wider context, Robinson used (from 1962) a type-theoretic approach: he considered a ‘layered’ type-theoretic structure which, in addition to the ground-level individuals, say, the reals, also contains all entities of finite orders obtainable from these individuals (such as those mentioned in the preceding paragraph). By a well-known procedure, a layered type-theoretic structure can be replaced by a first-order structure. Essentially, this amounts to considering the higher-order entities as ground-level individuals of different sorts. The membership relation between entities of different orders now becomes a first-order relation connecting individuals of different sorts. This many-sorted first-order structure can be taken as the ground structure U whose enlargements are obtained as outlined in §2 above.

An equivalent but technically simpler approach, first proposed by Machover (1967), is to embed the original set of individuals in a model of Zermelo’s set theory - a sufficiently large part of the so-called ‘cumulative hierarchy of sets’ (see Set theory §1). This constitutes a first-order structure in which all the entities of analysis are present as individuals (of the same sort). The basic relations in such a Zermelo structure are the first-order relations of equality ($=$) and set membership ($\in$). Zermelo structures can be enlarged in the usual way.

Another set-theoretic approach, invented by E. Nelson (1977), proceeds axiomatically. Nelson’s internal set theory is a conservative extension of Zermelo-Fraenkel set theory with the axiom of choice (see Set theory §1). Its universe of discourse contains all standard sets as well as nonstandard *sets. Using a special formal primitive predicate, ‘is standard’, counterparts of the transfer principle and saturation conditions are decreed as additional postulates.

For many applications of NSA it is irrelevant which of the infinitely many enlargements of a given ground structure is used. But special enlargements are sometimes singled out either for convenience of exposition or because their special properties are needed for a particular application.

One special kind of enlargement is obtained by taking an ‘ultrapower’ of the ground structure - an infinitary construction foreshadowed by Skolem in 1934 for the natural numbers and Hewitt (1948) for the reals. Luxemburg used an ultrapower enlargement of $\Re$ in one of the earliest broad expositions of NSA (1962). The advantage of this lucid presentation is that it does not presuppose acquaintance with logical technicalities, and was therefore particularly suited for an audience of mathematicians unfamiliar with them. However, it paid for this convenience by having to prove separately each instance of the transfer principle.

Some applications of NSA need enlargements that satisfy certain stronger saturation conditions. Notably, the extremely useful procedure for obtaining a Loeb measure (see below) requires the enlargement to satisfy a condition known as ‘$\aleph_1$-saturation’.

4 Range of applications

Robinson himself initiated a formidable array of applications of NSA in a wide spectrum of mathematical topics,

ranging from algebraic number theory, through various branches of classical and modern analysis and probability theory, to mathematical physics. Here we can mention only a few applications.

Generally speaking, NSA is a particularly powerful tool in problems involving the topological notion of compactness, because the nonstandard characterization of compactness is extremely simple and transparent compared with the standard definition.

Indeed, one of the earliest impressive successes of NSA was the solution by Robinson (1966) with A.R. Bernstein of an open problem concerning Hilbert spaces, which involved topological compactness in an essential way. Since then there have been many important applications to linear spaces and functional analysis.

NSA also provides illuminating insights into structures in which continuity or analyticity and algebraic notions interact; for example, in topological and analytic groups, whose nonstandard study was initiated by Robinson. In such structures, the whole of the continuous or analytic aspect is 'algebraicized' and encapsulated in a single group of infinitesimal *members. Exploiting these ideas, Hirschfeld (1990) was able to simplify very significantly the solution of one of Hilbert's celebrated problems.

Some of the most spectacular achievements of NSA are in probability theory. In this connection, E. Nelson's work (1987) is noteworthy in providing a far-reaching simplification of difficult parts of the theory. Arguably the most important breakthrough in NSA published after Robinson's death was the invention by Loeb (1975) of a powerful nonstandard procedure for obtaining standard probability measures (as well as more general unbounded measures) with prescribed desirable properties.

Robinson himself was - unusually for a logician - an expert in applied mathematics and mathematical physics (particularly in fluid dynamics). Applications of NSA in these areas, initiated by him and continued by others, have been of very great importance.

5 Status of NSA

If revolutions have ever occurred in mathematics, then NSA may be described as one of them (Dauben 1992). Logicians have in general welcomed it, in some notable cases with great enthusiasm. Thus, in Gödel's view, 'there are good reasons to believe that nonstandard analysis, in some version or other, will be the analysis of the future' (see Robinson [1966] 1974). Some logicians have written elementary calculus text-books for beginners using NSA (for example, Keisler 1976).

Among working mathematicians generally, the spread of NSA techniques has been relatively slow. As pointed out in §2, any nonstandard proof of a standard theorem can theoretically be replaced by a standard proof. Although nonstandard techniques are often significantly more efficient, they require familiarity with logic, which many mathematicians do not possess. However, the acceptance of NSA among mathematicians has been boosted by the successes of its practitioners. In this respect the results initiated by Loeb's work (see §4) have played a pivotal role.

But the view that NSA is destined to supersede standard analysis altogether should be taken with a grain of salt. This is because a given structure has infinitely many enlargements, none of which can be singled out as in any way canonical or 'best', and a standard definition is needed in order to verify that a nonstandard characterization of a concept is independent of the choice of enlargement (see Machover 1993).

Analysis, philosophical issues in

The term 'mathematical analysis' refers to the major branch of mathematics which is concerned with the theory of functions and includes the differential and integral calculus. Analysis and the calculus began as the study of curves, calculus being concerned with tangents to and areas under curves. The focus was shifted to functions following the insight, due to Leibniz and Isaac Newton in the second half of the seventeenth century, that a curve is the graph of a function. Algebraic foundations were proposed by Lagrange in the late eighteenth century; assuming that any function always took an expansion in a power series, he defined the derivatives from the coefficients of the terms. In the 1820s his assumption was refuted by Cauchy, who had already launched a fourth approach, like Newton's based on limits, but formulated much more carefully. It was refined further by Weierstrass, by means which helped to create set theory. Analysis also encompasses the theory of limits and of the convergence and divergence of infinite series; modern versions also use point set topology. It has taken various forms over the centuries, of which the older ones are still represented in some notations and terms. Philosophical issues include the status of infinitesimals, the place of logic in the articulation of proofs, types of definition, and the (non-) relationship to analytic proof methods.

1 The calculus: Newton, Leibniz and Lagrange

To begin in geometric terms, the differential calculus provides methods of determining the slope of a tangent to a curve, while the integral calculus finds the area between the curve and the *x*-axis. The study of tangents and areas goes back to ancient times, but prior to Isaac Newton and G.W. Leibniz tangents were determined at specific points and areas were always definite ones, that is, taken between a specific starting point and end point on the *x*-axis. Their new insight - treating a curve as being the graph of a function $f(x)$ - was to determine the tangents and areas as new *functions*. Thus the derivative function f' gives the rate of change of the function *f*, and the indefinite integral $\int f$ is a function showing how the area under *f* (taken from some arbitrary starting point) varies with the end point. The two calculi are inverse: the 'fundamental theorem' states that

(1) $(\int f)' = f$ and also $\int(f') = f$ (+ constant).

In Newton's version (created 1660s, published 1700s; see Newton (1967-81); Newton, I. §6) the differential was a 'fluxion', the rate of change of a variable quantity relative to time (understood conventionally); conversely, that variable was the 'fluent' of its fluxion. His definitions involved changes in dimension: a point as the limit of a sequence of lines of decreasing length, and so on. He defined his functions in terms of limits, but in a very naïve way.

Leibniz formed his differential and integral calculus in the 1670s (published 1680s; see Leibniz, G.W. §§1, 10) independently of Newton, and in a quite different form. It was based on the idea that a 'differential' d*x* could be created as an infinitesimal increment on *x*, with the same dimension as *x*; the slope of the tangent to the curve corresponding to $f(x)$ was $\mathrm{d}f(x)/\mathrm{d}x$. For linear variables *x* and $f(x)$ the 'integral' $\int f(x)\mathrm{d}x$ was the sum of the areas of rectangles $f(x)$ high and d*x* wide. Thus his version of the principal relationship (1) is

(2) $\mathrm{d}(\int f(x)\mathrm{d}x)/\mathrm{d}x = \int(\mathrm{d}f(x)/\mathrm{d}x)\mathrm{d}x = f(x).$

Another point of superiority of these theories over their predecessors was that the defined functions were themselves variable; thus they admitted of higher-order fluxions (differentials) and fluents (integrals). Physical phenomena of certain kinds could be expressed as 'differential' (or 'fluxional') equations of some order; finding their solution(s) became a major concern in mathematics, with many important applications in mechanics and geometry.

Of the two forms, Leibniz's gradually gained a considerable ascendancy during the eighteenth century. In one respect his use of the word 'function' was misleading, in that often no functional dependence obtained: variables could vary together. But during the 1750s Leonhard Euler realized the advantage of systematically specifying one variable (*x*, say) as a basis in a problem, relative to which the others were functionally dependent. His criterion was that d*x* be constant, so that further derivatives $\mathrm{dd}x, \ldots$ were all zero; then the differentials of other variables (*y*, say) were related to d*x* via 'differential coefficients' $p(x), q(x), \ldots$ of $f(x)$ with respect to *x*:

(3) $\mathrm{d}f(x) = p(x)\mathrm{d}x,$
$\mathrm{dd}f(x) = q(x)(\mathrm{d}x)^2, \ldots.$

Another major extension due then to Euler and others was to allow several variables in a problem to be independent; this move greatly increased the range of phenomena which could be represented, in ‘partial differential equations’.

During the late eighteenth century J.L. Lagrange proposed, as an alternative to limits and infinitesimals, that the differential calculus was obtainable from the so-called ‘Taylor series’, the expansion of a function *f* about any value of *x* with $h > 0$:

(4) $f(x+h) = f(x) + hf'(x) + h^2 f''(x)/2! + \ldots.$

(This important result had been named after Brook Taylor, although it had already been found by his master Newton and by Leibniz.) The ‘derived functions’ $f'(x),\ f''(x), \ldots$ (to use Lagrange’s name and notation for them) were *defined* as the coefficients of powers of *h* in the expansion (4); in his opinion they could be determined solely from (4) and algebraic manipulations. The integral calculus was based on reversing the operations; from f'' to f', and so on.

Lagrange’s approach became most widely circulated through the textbook *Théorie des fonctions analytiques* (1797), which was based upon his teaching at the recently founded École Polytechnique in Paris. He also extended his approach and associated with it an allied subject, the calculus of variations, which produced from a given function neighbouring functions which varied slightly from it. This theory, which became of major importance in applications, is also of philosophical interest, in that it requires possible worlds in which, for example, a particle may move along curves defined by functions varying slightly from the function whose curve it actually followed and which the theory was intended to determine.

Lagrange’s approach also came to have profitable influences on algebra in the early nineteenth century; in particular, some of its consequences provided powerful analogies for Boole and De Morgan in their contributions to algebraic logic. But the assumptions behind (4) seemed too good to be true; and in fact (4) was refuted by means of counter-examples, in the 1820s.

2 Mathematical analysis: Cauchy and Weierstrass

These torpedoes came from A.L. Cauchy, who had already begun to develop a fourth approach - ‘mathematical analysis’ (his name) - as part of his own teaching at the École Polytechnique. As with Newton’s calculus, the theory of limits served as his basis, but he treated them in a far more careful way, with general definitions and an exploration of properties. In addition, the theory of functions and the convergence of infinite series joined the calculus under limit theory. He raised the level of rigour in various ways, of which some involved points of logic. He gave independent definitions of the derivative and the integral:

$$f'(x) := \lim[(f(x+h) - f(x))/h] \text{ as } h \to 0;$$

$$\int f(x)\mathrm{d}x := \lim \sum_r [(x_r - x_{r-1})f(x_{r-1})], \text{ with}$$

$$x_0 \le x_{r-1} < x_r \text{ and } x_0 \le x \le \lim_{r\to\infty} x_r,$$

$$\text{as } \max_r |x_r - x_{r-1}| \to 0.$$

Cauchy retained Lagrange’s notation and name for $f'(x)$, but otherwise things were quite different. In particular, for the first time, (1) became the fundamental *theorem* of the calculus, concerning the inverse relationship between differentiation and integration under the sufficient conditions that $f(x)$ was continuous (in his sense); previously the switch between the two calculi had been more or less automatic. He showed the merit of systematically specifying necessary and/or sufficient conditions under which theorems were held to be true, and of enhancing theory by seeking weaker versions of the former and stronger versions of the latter. He even pioneered the methodical numbering of expressions in a paper or book.

Although Cauchy’s theory is not very intuitive (his students and colleagues hated it), it gradually became accepted,

especially after its adoption and refinement by Karl Weierstrass (at his widely influential lecture courses at Berlin from the 1860s) as the now standard ‘epsilon-delta’ treatment of limits. He stressed the need for extra care when several variables were moving towards their respective limits simultaneously, for example, in distinguishing between the following:

$$to \lim_{x\to a, r\to\infty} \sum_r u_r(x), (5) \lim_{x\to a} \lim_{r\to\infty} \sum_r u_r(x), \lim_{r\to\infty} \lim_{x\to a} \sum_r u_r(x),$$

where in the first case the two limits move together. Weierstrass and his followers also realized the importance of distinguishing the least upper bound of a collection of values from its upper limit. For example, the upper limit of the sequence 5, 7, -4, $\frac{3}{2}$, $\frac{5}{3}$, $\frac{7}{4}, \ldots (2n-1)/n, \ldots$ is 2, but the least upper bound is 7.

Among related developments, Georg Cantor was inspired from the early 1870s to create both his point set theory and transfinite arithmetic from solving certain technical questions in analysis by Weierstrassian methods. The further refinement of conditions on theorems such as (1) included the need to define irrational numbers in terms of rationals in order to prove theorems on their existence without begging the question posed. Cantor and Weierstrass had versions, but the best remembered is the ‘cut’ definition of Richard Dedekind in 1872. Associate each rational number with a point on the continuous straight line by natural order. Cut the line at any point, then the numbers are divided into two classes: to left (L) and to right (R). If L has no greatest member and R no smallest, then the cut does not correspond to any rational number, and thereby defines an irrational one (see Numbers §6).

The generally rising levels of rigour in proof - especially the increasing numbers of variables in problems, with ever more intricate functional relationships between them - inspired Giuseppe Peano in the late 1880s to create elements of ‘mathematical logic’ (his phrase), in order that the language itself of mathematical analysis would be made more rigorous, by relying less on prose. He formulated the propositional calculus in quite an axiomatic manner (not a common way of doing mathematics at that time), and introduced ‘propositional functions’ and quantification over their argument places. The latter technique was especially significant in clarifying the order of quantifiers for several variables; distinguishing the expressions in (5) is an important example.

The Weierstrassian tradition, together with Cantorian set theory, became standard fare in pure mathematics and some (but by no means all) applications by the beginning of the twentieth century. Cauchy’s theory of the integral was extended into the measure theory of Henri Lebesgue and others in the 1900s. At the same time various forms of the axiom of choice were found, revealing unexpected gaps and assumptions in proof methods; but gradually their place in analysis (and set theory) was evaluated and (for most figures) their non-constructive character was tolerated. Various generalizations were made: for example, defining the calculus over groups of some kind rather than over real numbers. In addition, the mathematical analysis of complex variables, which Cauchy had initiated along with his creation of the real-variable theory, rose to major status in mathematics - in his version and in alternatives due to Bernhard Riemann and to Weierstrass.

In one respect, reaction to Cauchy was negative. He had declared that divergent series were normally illegitimate for mathematical use; however, in the late nineteenth century, it became understood that the sum of a series could only be defined relative to a manner of summing its terms, and that the normal method (first term $+$ second term $+\ldots$) was not the only one. Thus a sum such as

(6) $1-1+1-1+\ldots=\frac{1}{2}$

was true under certain methods of summation, although the series had no sum under the usual method of adding term by term. This discovery rendered still more complicated the relationship between series and functions, which had already suffered a jolt from Cauchy’s refutation of Lagrange’s assumption (4).

3 Some philosophical issues

Several points of philosophical interest have already arisen. A few others will be made here.

Various types of infinitesimal had been used in the calculus and analysis over the centuries. The three main kinds, not always clearly distinguished, were: (a) the ‘infinitely small’, a variable quantity with limiting value zero (Cauchy proposed a new form of this kind); (b) ‘nulls’, such as the d*x* in (2), which are smaller than normal quantities; and (c) ‘pseudo-infinitesimals’ - quantities different from zero and yet smaller than any assignable

quantity (Berkeley's criticism of the foundations of the calculus in 1734 were based upon this view). They all became unacceptable in Weierstrass' reign; but even then they gained some adherents, and since the 1960s theories have been produced which vindicate their use. The best known is the 'nonstandard analysis' of Abraham Robinson (see Analysis, nonstandard).

One aspect which splits limit theory apart from infinitesimals is that of dimensions. For Leibniz, if *x* is a line, d*x* is a very short line, dd*x* is a very, very short line, and so on; thus dimensions are preserved under the operations of differentiation and integration. By contrast, a theory which uses limits changes dimensions; for example, the limit of a sequence of lines is a point. Intellectually this difference is vast, with profound consequences for applications; it is one source of the non-intuitiveness of mathematical analysis, and applied mathematicians have often preferred to work with differentials, which allow the geometry of a given problem, controlled by dimensions, to be represented and manipulated with incomparable clarity and flexibility.

Once Euler had introduced the differential coefficient (alongside infinitesimals) with (3) above, the notion of function was at centre stage. A major philosophical consideration was that of *generality* of the notion of function. Euler himself had said that variables *x* and *y* may be related 'in any way' by a function, but he had in mind only the kinds of functions normally used in his day. The same remark applies to successors in the nineteenth century, such as J.P.G. Dirichlet, though with a somewhat wider realm in mind. Only in the era of measure theory do we find the set-theoretic version which is now standard; that *x* and *y* are functionally related without assuming any details about the means. A striking example is the 'characteristic function of the rationals', a type of totally discontinuous function which takes one constant value when *x* is rational and a different one when *x* is irrational. Dirichlet had held it to be pathological, as it had no integral in any sense that he could imagine; by contrast, it played a central role in Lebesgue's formulation of measure theory.

It followed from Cauchy's theory of functions that a continuous function may be without a derivative at certain points. Riemann extended this aspect by producing an exotic range of functions with corners and/or discontinuities; and Weierstrass capped it in 1872, with an example of a continuous function which never had a derivative. Results of this kind raised new questions in the traditional discourse of continuity and discontinuity (see Intuitionism).

The axiomatic treatment of analysis is often based on the completeness axiom - every non-empty bounded set of real numbers has a least upper bound (equivalent to Dedekind's cut principle mentioned in §2 above). The completeness axiom is impredicative and therefore violates Russell's vicious circle principle (see Constructivism in mathematics).

Cauchy's rigour was based in part upon broad definitions of basic concepts; definabilty and modes of definitions remained an important topic. In particular, Peano treated them as a central part of his logico-analysis: rules for forming them correctly, and the role in theories of definition under hypothesis. In addition, Cauchy had insisted that a mathematical function always be single-valued (so that, for example, $\sqrt{x}$ would have to be split into $+\sqrt{x}$ and $-\sqrt{x}$); in expressing this feature Peano came in 1897 to formulate the criteria for the existence of a referent to a definite description in mathematics that Bertrand Russell was to propose in 1905 for natural language in his famous paper 'On Denoting' (see Descriptions; Russell, B.A.W. §9).

The long-suffering word 'analysis' was forced to fulfil still more duties by this subject. The traditional link with algebra was already becoming tenuous by the late eighteenth century, and was weakened further by Cauchy's refutation of (4) as a foundation. In addition, proofs in mathematical analysis from Cauchy onwards are usually synthetic, in that they start out from definitions of basic notions (continuity of a function, say) and/or proven results and finish with the theorem required.

Weierstrass introduced a methodology, with particular bearing upon mathematical analysis: examine all the exceptional and special cases, and do not be content with theorems about 'in general… '. Cantor was led to his set theory by obeying such a stricture (see Cantor, G. §1).

Do foundations have foundations of their own? Mathematical analysis shows beautiful examples to illustrate this question: Weierstrass underpinned the foundations which Cauchy had provided by refining single-limit theory into multiple-limit theory and the other aspects mentioned above, which Cauchy and his contemporaries had handled freely; but he and his generation took for granted making an infinite selection of members from a set, which was

recognized in the axiom of choice to be an additional question.

Analytic ethics

*Moral philosophy has traditionally been divided into normative ethics and meta-ethics. Normative ethics concerns judgments about what is good and how we should act. Meta-ethics, with which 'analytic ethics' is typically identified, seeks to understand such judgments. Are they factual statements capable of being literally true or false (*cognitivism*)? Or are they commands or expressions of attitude, capable only of greater or lesser appropriateness or efficacy (*noncognitivism*)? Cognitivists focus on whether the facts to which they claim moral judgments correspond are discovered from experience, or whether they occupy a different realm, as do mathematical facts. Noncognitivists, in contrast, arguing that moral judgments are not fact-stating, ask if they signal our feelings or commitments, or are imperatives of conduct.*

Other questions concerning moral judgments include whether they are subjective or objective, and how they are connected to motivation. Analytic ethics therefore not only concerns the meaning of moral terms, but ranges over such areas as epistemology, metaphysics and the theory of action. As a field it remains full of controversy. It has developed approaches that afford specific insights into morality, and contributed to our understanding of the functions of thought and language.

1 From intuitionism to noncognitivism

Prior to the twentieth century, questions about the nature of moral judgment were framed primarily in substantive terms: Which 'faculties' are involved? What sorts of acts or traits of character are morally good or bad, right or wrong? Some philosophers (such as Hutcheson and Hume) emphasized the role of sentiment, while others (such as Kant) stressed reason (see Kantian ethics; Moral sense theories). Some (Hume, Kant) took ordinary moral practice as a touchstone, while others (Bentham, Mill) attempted to defend an 'external standard' that could reform moral opinion.

In the twentieth century, G.E. Moore succeeded in founding a new tradition that came to insist upon a rigorous separation of questions of meaning from substantive questions. In *Principia Ethica* (1903), he introduced the 'open question' argument: for any purported analysis *A* of a moral concept in nonmoral terms (for example, 'Good' = 'Conducive to happiness'), consider the question, 'Yes, I see that *x* is *A* (for instance, *x* conduces to happiness), but is *x* good?'; if this question is intelligible, and not as trivial as, 'Is *x*, which is *A*, also *A*?', then even if we come to agree that *A* is good, *A* cannot simply be what we *mean* in calling something 'good'. Moore used this argument to advance his claim that 'good' names a *sui generis*, non-natural property, known by a kind of rational intuition (see Intuitionism in ethics). Moore also believed that this property supervenes on natural properties: any two things with just the same natural properties would necessarily be equally good (or bad) (see Supervenience). Natural properties were thus seen as 'good-making', but Moore thought it a 'naturalistic fallacy' to equate good with them.

Subsequent philosophers tended to agree that good cannot be analytically reduced to a natural property, but rejected Moore's rational intuition. Logical positivists, for example, divided cognitively significant propositions into two categories, the analytic, knowable a priori because tautological, and the synthetic, knowable a posteriori by empirical means (see Logical positivism §3; Analyticity). Intuitionist claims of synthetic a priori moral knowledge fit neither category: the open question argument showed that substantive moral theories are not analytic, but the lack of any empirical procedure for resolving fundamental moral disputes showed that they could not be synthetic either. Loyal to the positivist bifurcation, A.J. Ayer (1936) concluded that moral judgments expressed not cognitively significant propositions, but emotions (see Ayer, A.J.).

C.L. Stevenson (1944) endorsed this conclusion, though not for positivistic reasons, and moreover showed how emotivism could explain something intuitionism had made very mysterious - the seeming 'magnetism' or 'action-guidingness' of moral judgments. Intuitionists see moral judgments as descriptions of a special realm of abstract qualities, such as moral rightness. But description seems motivationally neutral. Why then is it odd for someone to say, 'This is the right thing to do, but I'm in no way for it'? (Contrast this with the remark, 'This is the tidiest thing to do, but I'm in no way for it.') Emotivists, on the other hand, see judgments of moral rightness as expressions of one's approval of a course of action, establishing a necessary or 'internal' connection to the speaker's motivations. Moral disagreement among speakers is seen as conflict in attitudes or commitments among speakers, given its special interest by the need for resolving the question, 'How should I (or we) act?' (see

Emotivism; Moral motivation §§1-2).

Emotivism is one form of noncognitivism, which interprets moral judgments as expressions or imperatives, not as descriptions of ‘objective reality’. Must noncognitivists therefore see moral judgments as ‘merely subjective’, immune to rational argument and liable to revision whenever the mood strikes? Stevenson, R.M. Hare (1952) and others have argued that nothing in noncognitivism prevented speakers from seeing their attitudes as based upon straightforwardly cognitive, objective considerations, so long as this relation is not seen as an analytic derivation (see Hare, R.M.). Perhaps it is part of what makes an attitude moral that one is committed to universalizing the judgments it supports or giving certain kinds of impersonal reasons in its defence. By the 1950s, noncognitivism’s combination of explanatory power with freedom from metaphysical baggage enabled it thoroughly to supplant intuitionism as the dominant position in analytic ethics.

2 Challenges to noncognitivism

Not everyone was convinced that noncognitivism could adequately accommodate the cognitive aspects of moral thought and language. Peter Geach (1965) pointed out that noncognitivists failed to show how moral claims, construed as essentially non-propositional, could display the full logic and grammar of propositions, as actual moral judgments unquestionably do. If, for example, ‘Stealing is wrong’ expresses one’s attitude of disapproval of stealing, then how are we to understand the conditional, ‘If stealing is wrong, then stealing without being caught is still wrong’, which could be asserted sincerely by someone who does not disapprove of stealing at all? Recent noncognitivists, notably Simon Blackburn and Allan Gibbard, have taken up Geach’s challenge, but it is fair to say that no fully satisfactory solution has yet been given.

Critics like Philippa Foot (1978) and Geoffrey Warnock followed a different strategy against noncognitivism, in part by noting that the open question argument has narrower scope than previously supposed. Understanding moral language, they argued, involves grasping certain contentful relations of relevance as well as knowing how to use its expressive force. Consider the remark, ‘This new petrochemical project is an ethical marvel; it will make our firm famous throughout the world! Of course, it will cause human dislocation and suffering - but what could that possibly have to do with ethics?’ Such a remark would betray a very imperfect understanding of moral language, even on the part of someone indifferent to human suffering who nevertheless cared unconditionally about the fame of his company. A plausible noncognitivism must at least allow that substantive norms of relevance govern moral discourse and that descriptive content can thereby accrue to moral language in a secondary way. But once substantive content has been admitted, the challenge can be pushed further. Why say that content is secondary and expressive force primary? Noncognitivists will point to the success of their ‘internalist’ account of the relation of moral judgment and motivation. But Foot challenges this. If a person calls their project an ethical marvel because it publicizes their company, we do not know what they are talking about. But someone who says, ‘Sure, a progressive tax on incomes would be more just, and that is fine if you care about justice for its own sake, but what is it to people like me?’, will strike us as more antipathetic than linguistically confused. Perhaps, as Foot and William Frankena have suggested, it would accord better with actual use to see the connection between moral judgment and motivation as a matter of what is typical rather than essential. Typically we care very much, individually and socially, about the kinds of things morality is concerned with - such as wellbeing and even-handedness - and we tend to dislike and distrust those who show no interest in such matters. Moreover, we tend to think they ought to show more interest. But we can understand this ‘ought’ as signalling the unconditional character of moral norms, without seeing it as marking a special realm of rational or motivational necessity. After all, we apply norms of etiquette even to the obdurately rude.

Critics have also questioned some of the contrasts upon which noncognitivism has been based. Some have followed Quine in challenging the logical positivist’s version of the analytic/synthetic distinction (see Quine, W.V. §§3, 8). Thomas Nagel (1970) and John McDowell (1985) have considered alternatives to the Humean thesis that cognitive states cannot suffice for action except when combined with desires. McDowell and David Wiggins (1987) have challenged us to rethink the subjective/objective distinction, by exploring a possible analogy between value and secondary qualities such as colour, which seem both to involve a human response and to be objective (see Secondary qualities). Hilary Putnam (1981) has argued that philosophy of science no longer supports the fact/value contrast as traditionally drawn, since rationally optional norms suffuse the process of scientific ‘fact-finding’ (see Putnam, H. §8).

At the same time, various philosophers have sought to develop a positive conception of the factual status of moral judgments. Some have done so ‘on the cheap’, by urging a minimalist conception of truth according to which a discourse is apt for truth or falsity merely if it displays the full grammar and logic of assertion, as moral discourse uncontroversially does. Others have retained a substantive notion of truth, but have claimed that moral statements can earn truth-evaluabilty in this more robust sense. For example, one group of nonreductionist moral realists, including Richard Boyd and Nicholas Sturgeon, have argued that moral predicates can meet naturalistic criteria of property-attribution by playing a role in the best explanatory theories of empirical science. Other philosophers who take naturalistic concerns seriously, such as Richard Brandt, Gilbert Harman and David Lewis, have sought to provide reductions or reforming definitions of moral notions in terms of idealizations of psychological properties. Yet another group, partly inspired by a non-naturalist Kantian tradition, have argued that the objectivity of moral judgment cannot be impugned by invidious comparisons with empirical science. Morality’s subject matter, they argue, is a realm of practical reasons - reasons for action, not belief - and whether this domain can be a source of truth and knowledge depends not upon vindicating an ontology of ‘moral facts’, but upon the existence of objective reasons for agents. Kurt Baier, Thomas Nagel and John Rawls, among others, have attempted to show how we might understand the possibility of such reasons.

Other critics of the dialectic set in motion by noncognitivism have taken a more radically questioning stance. Bernard Williams (1985), Alasdair MacIntyre and various feminist philosophers have in different ways asked where the demand for objective or rational validation in ethics comes from in the first place, and whether, on reflection, it has sufficient credibility or interest to sustain the project of analytic ethics or ‘moral theory’ (see Williams, B.A.O.; Feminist ethics).

3 Leading issues

Although noncognitivism has been widely criticized, no cognitivist explanation of moral phenomena has yet been developed with anything like the systematic power found in the work of Stevenson, Hare or Gibbard. Nor have those who call for an end to ethical theorizing managed to show how we could do without it. The main questions one might expect to figure in continuing debates include: In what sense is it a substantial achievement for a discourse to be truth-evaluable, or is this the modest and inevitable outcome of an assertoric grammar? If the former, then what does that achievement require? If the latter, then what notions, if any, of objectivity and factuality remain to distinguish among assertoric practices, and how does ethics stand with these? Is motivation necessarily related to making or being subject to moral judgment? Is a noncognitivist approach to moral discourse ultimately self-destabilizing, since it construes normativity in non-factualist terms and yet appears to presuppose for its own purposes facts of meaning, arguably a normative domain? Should historicist and feminist criticism of analytic ethics be understood as offering an alternative, or as showing how a more genuinely objective and worthwhile analysis of ethics might be possible?

Analytical philosophy

Philosophical analysis is a method of inquiry in which one seeks to assess complex systems of thought by 'analysing' them into simpler elements whose relationships are thereby brought into focus. This method has a long history, but became especially prominent at the start of the twentieth century and, by becoming integrated into Russell's development of logical theory, acquired a greater degree of sophistication than before. The logical positivists developed the method further during the 1930s and, in the context of their anti-metaphysical programme, held that analysis was the only legitimate philosophical inquiry. Thus for them philosophy could only be 'analytical philosophy'.

After 1945 those philosophers who wanted to expand philosophical inquiries beyond the limits prescribed by the positivists extended the understanding of analysis to include accounts of the general structures of language and thought without the earlier commitment to the identification of 'simple' elements of thought. Hence there developed a more relaxed conception of 'linguistic analysis' and the understanding of 'analytical philosophy' was modified in such a way that a critical concern with language and meaning was taken to be central to it, leading, indeed, to a retrospective re-evaluation of the role of Frege as a founder of analytical philosophy. At the same time, however, Quine propounded influential arguments which suggest that methods of analysis can have no deep significance because there is no determinate structure to systems of thought or language for the analytical philosopher to analyse and assess. Hence some contemporary philosophers proclaim that we have now reached 'the end of analytical philosophy'. But others, who find Quine's arguments unpersuasive, hold that analytical philosophy has virtues quite sufficient to ensure it a role as a central philosophical method for the foreseeable future.

1 The method of analysis

The term 'analysis' has its origins in a classical Greek word denoting the activity of taking something apart; and the thought that such an activity might be a model for explanations of complex structures by reference to their simpler parts is itself a Greek thought, exemplified by Socrates' dream in Plato's *Theaetetus* (see Plato §15). In the early modern period, the idea of analysis reappears in Descartes' injunction that one should identify the 'simple natures' characteristic of one's subject-matter, which Arnauld explicitly describes in *La logique, ou l'art de penser (The Art of Thinking)* (1662) as the adoption of a 'method of analysis' (see Arnauld, A.; Descartes, R.). This method then can be found in much of the philosophy of the period, as in Locke's account of 'complex ideas' in his *Essay Concerning Human Understanding* (1689), which is conducted in terms of an analysis of them into their constituent 'simple ideas' (see Locke, J. §4).

Kant's 'Transcendental Analytic' in his *Critique of Pure Reason* moves away from the Cartesian analysis of 'ideas' to the analysis of our capacities for understanding and judgment (see Kant, I. §§6-7); and as the idealist tradition develops, especially in the work of Hegel, there is a further shift away from the method of analysis to the 'method of dialectic'. Hence one aspect of the break with idealism initiated by G.E Moore (§2) is a call for a return to the method of analysis: thus in the course of arguing against idealist accounts of judgment, he maintained that 'a thing becomes intelligible first when it is analysed into its constituent concepts' (Moore 1899: 182). As Russell always acknowledged, it was this Moorean conception of analysis which initially inspired his own analytical programme, although in also accepting that there is a sense in which 'analysis is falsification' (Russell 1903: 141), he equally recognized its limitations.

Although Russell had a decisive role in the emergence of the self-consciously 'analytical' conception of philosophy, many other philosophers at the end of the nineteenth century sought to return to a method of analysis. Brentano's approach to psychology was explicitly analytical, and there is a direct route from Brentano's analytical psychology to Husserl's programme of phenomenological analysis (see Brentano, F.; Husserl, E.; Phenomenology, epistemic issues in). Similarly, from among the American pragmatists, C.S. Peirce wrote that that 'the only thing I have striven to do in philosophy has been to analyse sundry concepts with exactitude' (Passmore [1957] 1968: 104).

2 From philosophical analysis to analytical philosophy

The core thought behind this conception of analysis is that of the explanation of a whole by reference to its parts. But since philosophical analysis involves no physical decomposition of a whole into its parts, it needs to be made clear how this talk of ‘analysis’ makes sense.

In the case of logical analysis the basic idea is that one can explain the inferential significance of a statement through an account of its ‘logical form’, which, by identifying the presence of certain simple ‘logical constants’ in the statement, enables one to fit it into a general logical theory that shows how to argue for it and from it. In Russell’s writings the scope of this idea was much extended by allowing that the logical analysis of a statement can lead one to an account of its logical form which discerns the presence of logical constants that were certainly not apparent in the surface structure of the statement. His theory of descriptions, which assigns to the statement ‘The present King of France is bald’ the logical form ‘ $(\exists x)(Fx \mathbin{\&} (\forall y)(Fy \rightarrow y = x) \mathbin{\&} Bx)$’ is a classic case of a logical analysis of this kind (see Descriptions). Russell further enhanced the significance of logical analysis by taking it that a statement’s logical analysis revealed the ‘constituents’ of the proposition expressed by the statement. Thus he took it that his theory of descriptions showed that it was a mistake to regard the phrase ‘The present King of France’ as identifying a constituent of the propositions expressed by statements in which it occurs, even when they are true, since the description is eliminated by the logical analysis (see Logical constants; Logical form).

In the case of epistemological analysis, the guiding assumption is that complex claims to knowledge are justified by reference to simpler items of evidence, typically observations concerning which a high degree of certainty can be accepted. Hence the classic context for epistemological analysis is the empiricist theory that all evidence is, in one way or another, perceptual evidence and many empiricists have held that, in so far as beliefs about the world are warranted at all, it should be possible to provide an epistemological analysis of them which shows just how they can be supported by perceptual evidence (see Empiricism).

Both logical and epistemological analyses are normative, and for this reason can also be subversive. Russell develops his theory of descriptions into a theory of ‘logical fictions’ which implies that our ontological commitments are less extensive than we might at first suppose. Likewise, epistemological analyses imply that where a putative belief (a belief in immortality, perhaps) is one for which analysis reveals no satisfactory evidence, the credentials of the belief are called into question. This normativity is an aspect of all properly philosophical analyses: phenomenological analyses, properly understood, are not just introspective descriptions of appearances; they are supposed to elucidate the priorities within different modes of consciousness.

I shall not attempt to characterize here all the different kinds of analysis that are properly philosophical. For ‘analytical philosophy’ can be provisionally defined by the priority it assigns to logical and epistemological analysis. I have already mentioned the work of Moore and Russell, though neither of them held that philosophy is just analysis. Their most famous pupil was Wittgenstein, whose *Tractatus Logico-Philosophicus* (1922) is a paradigmatic exercise in logical analysis, resting on the assumption that ‘A proposition has one and only one complete analysis’ (1922: 3.25) (see Logical atomism). A little later, the members of the Vienna Circle sought to develop the analyses of Russell and Wittgenstein within the context of their positivist programme (see Vienna Circle). Despite their many disagreements, one common feature of their programme was the belief that ‘what is left over for *philosophy*… is only a *method*: the method of logical analysis’ (Carnap 1932: 77). They held that the only proper task for the philosopher is to engage in logico-epistemological analysis which clarifies the sense of questions about the world in such a way that they can be answered on the basis of scientific observation and experiment. It is, then, in the explicitly anti-metaphysical context of logical positivism that there occurs the transition from ‘philosophical analysis’, conceived of as *an* important method of inquiry, to ‘analytical philosophy’, which restricts genuine philosophy to analysis (as in Bergmann (1945: 194), which is, I think, the first explicit use of the term ‘analytical philosophy’).

3 Linguistic analysis

In the early post-1945 period this positivist conception of analytical philosophy was regarded as unnecessarily restrictive by many philosophers, especially those not enamoured of the scientific context of the positivist programme. Not wanting to return directly to old-fashioned metaphysics, they sought instead to extend the range of analytical techniques to cover a general concern with the normative aspects of language, while shedding a commitment to the identification of simple meanings or basic certainties. In Wittgenstein’s writings of this period

the underlying hope was the 'therapeutic' aspiration that philosophical perplexities would thereby be set to rest; whereas in the writings of Ryle, Austin, Strawson and other 'ordinary language' philosophers there was still the presumption that answers to old metaphysical questions such as those concerning the status of the mind (Ryle), appearances (Austin) and universals (Strawson) could be extracted from these inquiries (see Ordinary language philosophy, school of).

This broader conception of 'analytical philosophy' came to self-consciousness in the 1961 Anglo-French conference at Royaumont (Montefiore and Williams 1966), and it is, I think, only after this conference that use of the term 'analytical philosophy' became widespread (as in the title of the characteristic collections *Analytical Philosophy*, edited by R.J. Butler - Butler 1962, 1965). The sense of the term was, therefore, no longer confined to the logico-epistemological analyses of Russell and the logical positivists; instead it embraced a much broader critical concern with language, still resting on the presumption that this concern could somehow be put to work to solve, or dissolve, important philosophical problems.

This conception of analytical philosophy has been further refined by Michael Dummett, who has maintained that its distinctive feature is the priority it assigns within philosophy to the philosophy of language and that the founder of analytical philosophy, so conceived, is not Russell, but Frege (Dummett 1993). Both these claims, however, need some qualification.

As Dummett acknowledges, his emphasis on Frege's work is in part a retrospective re-evaluation. For although familiarity with Frege's work in logic and mathematics played an essential part in the development of Russell's work, Russell took his basic philosophical assumptions from Moore. Doubtless it would have been better if Russell had appreciated the significance of Frege's sense/reference distinction, but in fact he famously thought that his theory of descriptions rendered it unnecessary (Russell 1905). However, Rudolf Carnap - who, as we have seen, is one of the first to propound the thesis that philosophy can only be analytical - explicitly acknowledges his indebtedness to Frege, whose lectures he had attended (Carnap 1937: xvi); and it was, therefore, through Carnap's writings that Frege's philosophy of language was brought into the mainstream of analytical philosophy. Carnap also here acknowledges his debt to the great Polish logicians Ajdukiewicz, Leśniewski, Łukasiewicz and Tarski, whose works constitute in their own right major contributions to analytical philosophy, though ones that there is no space to describe here in detail (a full account should also include an account of the work of Hägerström and the other members of the early Swedish school of analytical philosophers) (see Polish logic; Scandinavia, philosophy in).

Although Dummett's claim that the distinctive feature of analytical philosophy is the priority it assigns to the philosophy of language fits well the conception of analytical philosophy that emerged from the early work of Wittgenstein and Carnap, it is certainly not a feature of Russell's early work nor, in fact, a self-conscious feature of Frege's writings, which famously include instead the thesis that sentences are true only in virtue of the nonlinguistic thoughts they express. Further, although Dummett's explanation of this priority in terms of the basic role within philosophy of a 'theory of meaning' fits his own writings and some of those of Donald Davidson, one has only to think of the hostility to 'theorizing' that is characteristic of Wittgenstein's later writings to see that Dummett's account is distinctly tendentious. Indeed, recent work in the philosophy of language and of mind increasingly calls into doubt Dummett's priority thesis (Stalnaker 1984) (see Evans, G.). Yet since those who argue for the alternative priority of mind over language employ the methods of logical and epistemological analysis characteristic of previous analytical philosophers - though applied now to the structure of mental, rather than just linguistic, representations - it would be quite inappropriate to locate here a movement that threatens to bring about the 'end of analytical philosophy'. That threat certainly exists, but it comes from another direction.

4 The end of analytical philosophy?

Just when analytical philosophy was coming to self-consciousness in the early post-war period, two of the assumptions of traditional methods of logical and epistemological analysis were called into question by W.V. Quine: (1) the assumption that there is a clear distinction (the 'analytic/synthetic' distinction) between logic and other disciplines which enables one to conduct the logical analysis of a statement without reference to these other disciplines; (2) the assumption that there is a single chain of justification from observation to more speculative claims about the world which enables one to construct an epistemological analysis of the latter in terms of the former (Quine 1953). In both cases Quine argued that in fact we find only a complex network of interdependent

relationships which undermines the prospect of establishing definitive logical or epistemological analyses. Further, he argued later (Quine 1960), our understanding of each other, and in particular of each other's utterances, is generally underdetermined by our observations of each other, and, as a consequence, the meaning of most of our utterances must be intrinsically indeterminate since there cannot be anything more to their meaning than is available to an intelligent observer (see Analyticity; Radical translation and radical interpretation).

Despite the fact that Quine's writings employ the standard techniques of logical analysis, some hold that his conclusions signal the end of analytical philosophy (Rorty (1980) gives an influential statement of this thesis). In thinking about this, however, one must bear in mind that already by 1945 most analytical philosophers had abandoned any commitment to simple meanings and basic certainties, and that the positivist thesis that philosophy could only be analytical philosophy was also soon rejected. Instead, the practice of analytical philosophers rested only on the assumption that methods of analysis can clarify conceptual and epistemological relationships in a way which contributes to the resolution or dissipation of philosophical problems. Do Quine's claims show that this assumption is unfounded? His indeterminacy thesis implies that the results of analytic inquiries can only be relative to one of an indefinite number of alternative systems of 'analytical hypotheses' between which there is nothing to choose (Quine 1960: 68), and thus that little of intrinsic significance can be detached from them. But Quine's arguments for the indeterminacy thesis are problematic since he allows only a narrow, behaviourist characterization of the evidence that is admissible to determine questions about the meaning of utterances. In order to question this restriction one need only invoke his own criticisms of 'foundationalist' approaches to questions of justification which imply that no such restriction on admissable evidence is legitimate. Quine's earlier arguments, by contrast, point to the holistic structure of our language and beliefs, and few analytical philosophers would want to dispute this (though there are exceptions, such as Dummett). But they will argue that indeterminacy does not follow from holism; on the contrary, talk of holism implies a system of normative relationships that is itself a legitimate subject for analytical inquiry. Admittedly, if there is no absolute analytic/synthetic distinction, the significance of these inquiries must itself remain open to question in the light of the broader theoretical concerns that influence one's choice of logic and epistemology. But this, so far from being the end of analytical philosophy, just reiterates the anti-positivist thesis that philosophy is not just analysis.

Analytical philosophy can, therefore, survive the contemporary prophets of doom by retreating to the pre-positivist thesis of the merits of philosophical analysis as an ingredient of philosophical inquiry, with a core commitment to the *explicit* articulation of the normative relationships, involving inference and justification, that connect concepts, beliefs and statements. This may seem too minimal a commitment to be worth a distinctive characterization as a kind of philosophy, but one has only to sample contemporary philosophical writings that do not share this commitment to recognize its value. To say this is not to say, however, that the methods of philosophical analysis are equally valuable in all areas of philosophy. There are those, such as Bernard Williams, who hold that in ethics and aesthetics the characteristic virtues of philosophical analysis may actually obstruct the proper exercise of a philosophical inquiry that aims to be truthful or imaginative (Williams 1995).

None the less, the robustness of analytical philosophy thus understood is best seen in the remarkable expansion in the acceptance and use of its methods that has taken place during the last half-century. This expansion has been both geographical and disciplinary. There has been an explosion of interest in analytical philosophy within non-anglophone countries, both in Europe and elsewhere (for instance, South America), leading to new dialogues between philosophers who had previously remained isolated in their own traditions. At the same time the ideas and methods of analytical philosophy have been applied to advance debates in areas of philosophy which had previously appeared remote from analytic concerns, such as the study of ancient philosophy (see Owen, G.E.L.; Vlastos, G.) and Marxism (Cohen 1978). By putting down roots around the globe and throughout the academy, analytical philosophy has shown that it is far too early to write its obituary (see Analytic ethics; Analytical philosophy in Latin America).

Analytical philosophy in Latin America

In Latin America, philosophical analysis has been portrayed as an intellectual revolution. Its avowed goal has been to replace the abstruseness and obscurantism of scholastic and metaphysical jargon perceived as typical of much of Latin American philosophy with the clarity and rigour of mathematical and scientific discourse. Arriving around the mid-1940s analytic philosophy at first met with little interest because of a shortage of its classics in translation, cultural obstacles and opposition from the more traditional, entrenched philosophies. By the 1960s it had overcome many obstacles and stimulated considerable philosophical activity, mainly in Mexico and Argentina. By the 1980s, in spite of political opposition, analysis had created an international forum for the discussion of philosophical problems. It attracted to its ranks several distinguished philosophers and scientists with philosophical interests, among them Mario Bunge (Argentina and Canada), Héctor-Neri Castañeda (Guatemala and the USA) and Francisco Miró Quesada (Peru). An ambitious translation effort was launched and several important journals were founded, such as Análisis filosófico (Philosophical Analysis), Revista latinoamericana de filosofía (Latin American Journal of Philosophy) (Argentina), Crítica. Revista hispanoamericana de filosofía (Criticism. Hispanoamerican Journal of Philosophy) (Mexico), Manuscrito (Manuscript) (Brazil) and Diálogos (Dialogues) (Puerto Rico).

1 Early development

Broadly understood, philosophical analysis is a collection of methods for uncovering the presuppositions, implicit meanings and logical implications of statements in philosophical, scientific, or ordinary language. Some Latin American contemporaries, such as Rabossi (1977), have portrayed analysis as a set of common concerns, an attitude of caution towards metaphysics, a demand for logical rigour and conceptual clarity and an interest in scientific and linguistic problems. Others, such as Salmerón (1992) considered it to be a collective task of philosophical reconstruction which leaves little space for local or personal peculiarities and makes international life and communications easier. Still others viewed it as 'an intellectual revolution… It's object is relatively clear: to steer philosophy in the direction of a coherent and scientific investigation' (Nuño 1965). The inspiration for analysis was the historical movement that emerged from the philosophical activities of Frege, Russell,Moore and the Vienna Circle (see Ordinary language philosophy, school of; Vienna Circle).

In Latin America, analysis did not receive much attention until the mid-1940s. A lack of translations accounts for this late start. Prior to 1945 only two works on analysis were available in Spanish: *Ethics* (Moore 1912) and *Problems of Philosophy* (Russell 1912), both of which were published in Buenos Aires in 1929, with a Portuguese edition of the latter at São Paulo in 1939. From 1945 a stream of translations began to appear of the work of such philosophers as Wittgenstein, Carnap, Ayer and Max Black. Another reason for the late start of analysis was a lack of awareness in Latin America of modern logical techniques so important to analytic work. Up to the 1940s most logic studies were about syllogisms (Romero and Pucciarelli 1939), or fallacies (Vaz Ferreira 1910). After the 1940s the modern logic texts of Ferreira da Silva (1940), Quine (1944) and Miró Quesada (1963) stand out. Later, the texts of Ferrater Mora and Leblanc (1955) and Hegenberg (1966) were prominent.

Other factors impeded the diffusion of analysis. Links to logical positivism brought to mind the outdated views of Comte, Spencer and the nineteenth-century Latin American positivists (see Anti-positivist thought in Latin America). The popularity of opposing approaches, such as well-entrenched idealism, Marxism, with its careful socioeconomic analysis of reality, or neo-Thomism, with its rigorous criticisms of science and modern formalism, hindered the growth of analysis. As a further hindrance, Gaos and other refugees from the Spanish Civil War brought with them well-articulated forms of existentialism and phenomenology. Several other Latin American philosophers expressed reservations about analysis, including Caso (1939; 1941) and Bunge (1944), both of whom were critical of logical positivism, and Frondizi (1945).

Some early support for analysis came from personal contacts with visiting scholars, such as Quine, Strawson and von Wright and from local philosophers who had direct acquaintance with logical positivists, such as Schajowicz (1964) and Lindemann (1946). It was not until the 1950s that analysis began to flourish, particularly in Mexico and Argentina.

2 Mexico

In Mexico, the earliest discussion of analysis can be found in Caso's works (1939; 1941). Caso, an opponent of nineteenth-century positivism, formulated a phenomenalist critique of what he called neopositivism. Philosophical analysis remained taboo until it was defended by Molina Flores (1954). However, it took six years for the Centro de Estudios Filosóficos, renamed in 1964 the Instituto de Investigaciones Filosóficas, to publish his translations of Moore (1912), Carnap and Ayer in its series *Cuadernos*.

With a growing body of translations and an increase in interest, the centre became a hub of analytic work and sponsored the journal *Crítica. Revista hispanoamericana de filosofía (Criticism. Hispanoamerican Journal of Philosophy)*, under the editorial supervision of Villoro, Salmerón and Rossi. The journal's policy was to display a critical attitude towards metaphysical speculation, traditional philosophical systems and problems, *Weltanschauung* philosophies and cultural or anthropological reflections on Latin American cultures. Committed to establishing a body of rigorous professional and technical materials, *Crítica. Revista hispanoamericana de filosofía (Criticism. Hispanoamerican Journal of Philosophy)*'s editors expressed a preference for verifiable explanations which referred to description and analysis, linked philosophy with methodological and scientific problems in the physical or social sciences, and which required rigour, precision and clarity instead of oratory or literary elegance. *Crítica. Revista hispanoamericana de filosofía (Criticism. Hispanoamerican Journal of Philosophy)*'s editors had originally trained in phenomenology under Gaos, but shifted towards analysis over a twenty-year period.

During the 1970s and 1980s, analysis became well established and a generation of students who grew up from there began to work at the institute, for instance, Trejo (1977), Margain (1978) and Olivé (1985a, 1985b). The institute brought to Mexico many well-known analytic philosophers. It also drew from the growing ranks of Latin American philosophers doing analysis, such as Bunge (1980) and Moulines (1982), as well as Castañeda, Coffa, Gracia and Sosa (see Mexico, philosophy in).

3 Argentina

One of the first Argentinian philosophers to be identified with analysis was Mario Bunge. A graduate from the University de la Plata, with a doctorate in physics from Simon Fraser University, Bunge was attracted to analysis after his initial rejection of it. In 1944 he became editor of the short-lived Minerva: Revista continental de filosofía (Minerva: Continental Magazine of Philosophy) (1944-5), the first Latin American journal dedicated exclusively to philosophy. Opting for an open, pluralistic approach, the journal published several early discussions on logical positivism, including Lindemann's, 'El "Círculo de Viena" y la filosofía crítica' (The Vienna Circle and Critical Philosophy) (1944).

In 1945 the members of the Grupo Argentino de la Academia Internacional de la Historia y Filosofía de la Ciencia began to meet periodically to examine the works of Russell and Moore. By 1952 the number of philosophers interested in analysis was large enough to found the Círculo Filosófico de Buenos Aires, with Bunge as its first chair. It was at the Círculo in 1954 that a draft of Bunge's important analysis of causality was first discussed (Bunge 1959). In 1956 the Agrupación Rioplatense de Lógica y Filosofía Céntifica was founded as a forum for Argentinian and Uruguayan philosophers and scientists interested in logic and the philosophy of science. Greater interest and specialization led in 1957 to the formation of two complementary groups. One, led by Gioja, the new director of the Instituto de Filosofía del Derecho y Sociología at the University of Buenos Aires, focused on problems in the philosophy of law, ethics, society and politics. The institute became a gathering place for international figures like Strawson, von Wright, Castañeda and younger Argentinian philosophers of law with an analytic orientation, among them Carrió (1965; 1970) and Rabossi (1977). The institute also sponsored *Notas de filosofía del derecho (Notes on Legal Philosophy)* (1964-9), a journal which published essays with an analytic orientation. The other, a more informal group, was interested in problems related to the philosophy of science, logic and language. It was led by Klimovsky and García, both of whom had joined Bunge in 1957 at the University of Buenos Aires. Of this group, Simpson distinguished himself with *Formas lógicas, realidad y significado (Logical Forms, Reality and Significance)* (1964), one of the earliest books in Spanish that dealt with such philosophers as Russell and Frege from an analytic perspective (see Argentina, philosophy in).

Between 1966 and 1983 political events decimated Argentinian intellectual life and many, including several analytic philosophers, were forced into exile - some permanently (Bunge went to Canada, Coffa and Gómez to the

USA).

4 Elsewhere in Latin America

In Brazil, the reaction against nineteenth-century positivism shifted attention to other approaches, such as Marxism and existentialism at the expense of the philosophies of science and logic. However, in São Paulo two of the earliest works in formal logic to appear in Latin America were published: Ferreira da Silva's *Elementos (Foundations of Mathematical Logic)* (1940) and Quine's *O Sentido da Nova Lógica (The Meaning of Modern Logic)* (1944). Quine's presence at the University of São Paulo in the early 1940s helped to make formal logic part of the philosophy curriculum and allowed Granger (1955), French philosopher of science, to teach logic and philosophy of science there from 1947 onwards. However, the 1964 military coup, in an effort to purge progressive elements at the University of São Paulo, eliminated logic and philosophical analysis from the curriculum. Philosophers found themselves without a livelihood or means of disseminating their knowledge until the late 1970s, when J.P. Monteiro, a specialist in Hume and contemporary epistemology, founded *Ciência e Filosofia* (1979-86), an interdisciplinary journal which published some analytic works. In 1975 Porchat Pereira, an Aristotelian scholar and logician, left the University of São Paulo to found the Centro de Lógica, Epistemología e História da Ciência at the University of Campinas. This new centre attracted many philosophers concerned with analysis, among them, da Costa, a specialist in nonstandard logic, and Dascal. It began to publish its journal, *Manuscrito* in 1977 (see Brazil, philosophy in).

In Peru two figures are important, Salazar Bondy, who died young and Miró Quesada, both members of the editorial board of *Crítica. Revista hispanoamericana de filosofía (Criticism. Hispanoamerican Journal of Philosophy)*. Salazar Bondy's essays were published in *Para una filosofía del valor (Towards a Philosophy of value)* (1971), a book on the analysis of the language of values in which he blends logical positivism and critical idealism to form a normative axiology. Miró Quesada, aware of the shortcomings of the traditional views of logic and science, found that formal logic and conceptual analysis provide both a critical attitude and a superior methodology, as they study the foundations of philosophy, or metatheory: 'a theory of theories… Its subject matter encompasses the study of principles, the analysis of points of departure, and the possibilities of deriving consequences of their fundamental presuppositions' (1963).

In Chile, where phenomenalism and neo-Thomism were popular, Rivano's translation of Ayer (1926) and Stahl's work on formal logic (1956; 1964) provided a theoretical base for later works by such philosophers as Torretti (1967), who made a study of Kant and later (1983) turned to problems of the history of science and Gómez-Lobo (1989), who translated Frege and applied the methods of analysis to ancient philosophy.

In Venezuela, Nuño turned to analysis after becoming interested in contemporary semantics. A polemical writer, his *Sentido de la filosofí contemporánea (Directions in Contemporary Philosophy)* (1965) is a general view of contemporary philosophy, especially logical empiricism and analytic philosophy. Elsewhere in Latin America, there has been little analytic activity. However, the wide dissemination of journals and books on analysis (Cuba being the exception) and the large number of international congresses and visiting philosophers make the scope of analysis (and of other Latin American philosophic movements as well) intercontinental. Contributing to that dissemination are the many philosophers who have migrated to the USA and Canada, such as Frondizi, Bunge, Castañeda, Gómez, Gómez-Lobo, Torretti, Sosa and Gracia. Of these, some, like Castañeda and Sosa, identify themselves with the English-speaking tradition: others, like Frondizi, with Latin America. While others, like Gracia, have succeeded in bridging the two continents.

Analyticity

In Critique of Pure Reason Kant introduced the term 'analytic' for judgments whose truth is guaranteed by a certain relation of 'containment' between the constituent concepts, and 'synthetic' for judgments which are not like this. Closely related terms were found in earlier writings of Locke, Hume and Leibniz. In Kant's definition, an analytic judgment is one in which 'the predicate B belongs to the subject A, as something which is (covertly) contained in this concept A' ([1781/1787] 1965: 48). Kant called such judgments 'explicative', contrasting them with synthetic judgments which are 'ampliative'. A paradigmatic analyticity would be: bachelors are unmarried. Kant assumed that knowledge of analytic necessities has a uniquely transparent sort of explanation. In the succeeding two centuries the terms 'analytic' and 'synthetic' have been used in a variety of closely related but not strictly equivalent ways. In the early 1950s Morton White (1950) and W.V. Quine (1951) argued that the terms were fundamentally unclear and should be eschewed. Although a number of prominent philosophers have rejected their arguments, there prevails a scepticism about 'analytic' and the idea that there is an associated category of necessary truths having privileged epistemic status.

1 The attack on 'analytic'

'Analytic' has been used in a wide variety of ways: truth by conceptual containment and truth whose denial is contradictory (Kant 1781/1787); logical truth (Bolzano 1837; Feigl 1949); truth by definition and logical derivation (Frege 1884; Pap 1958); truth in virtue of form (Schlick 1930-1); truth by definition and logical truth (Carnap 1937, 1947); truth by definition (Ayer 1936); truth based on meaning (Ayer 1936; C.I. Lewis 1944); truth by semantical rule (Carnap 1947); truth in all possible worlds (C.I. Lewis 1944; D.K. Lewis 1969); convertibility into logical truth by substitution of synonyms (Quine 1951); truth by implicit convention (Putnam 1962); and so on. Although related, not all of these uses are equivalent. For example, logical truths are not true by definition (in the sense of explicit definition), but they are trivially true by definition *plus* logic. Furthermore, Gödel's incompleteness result shows that logical derivability and logical truth are not equivalent (see Gödel's theorems §3). Likewise various principles (for example, supervenience principles; see Supervenience) which are true in all possible worlds seem not to be true by definition plus logic (if 'definition' does not include 'implicit definitions'; see Definition). Similarly, it may be doubted that correct definitions provide exact synonyms (see §4). Little care has been taken to distinguish these disparate uses and needless confusions have resulted. But, as Strawson and Grice (1956) note, observations of this sort 'would scarcely amount to a rejection of the distinction [as Quine urges]. They would, rather, be a prelude to clarification'.

In 'Two Dogmas of Empiricism' (1951), Quine went far beyond the call for clarification; he argued that there simply was no distinction between analytic and synthetic truths. Quine's argument is an enthymeme with roughly the following form: there is no non-circular, purely *empiricist* clarification of the distinction, and therefore there is no distinction at all: 'That there is such a distinction to be drawn at all is an unempirical dogma of empiricists, a metaphysical article of faith' (see Quine, W.V. §8).

2 Extending the attack to 'necessary' and 'a priori'

Quine's attack did not stop with 'analytic'. Following the lead of logical positivists, he (wrongly) held that, if there were any such distinctions, the analytic/synthetic distinction would be the same as the necessary/contingent distinction, which in turn would be the same as the a priori/a posteriori distinction. So, on his view, since there is no analytic/synthetic distinction, there is no necessary/contingent distinction and no a priori/a posteriori distinction either. It is an error, however, to equate these distinctions, so these further conclusions do not follow.

Quine's attack on the necessary/contingent distinction has not convinced many. Most philosophers accept the distinction and invoke it in their work; modal logic and modal metaphysics are thriving subjects (see Modal logic; Modal logic, philosophical issues in). Do modal notions have non-circular definitions? Although definitions have been suggested, such as Church (1951) and Bealer (1982), there would be nothing unreasonable in holding them to be primitive (Prior and Fine 1977). After all, everyone must take *some* notions to be primitive.

What *epistemic justification* do we have for the necessary/contingent distinction? No doubt Quine was right that it cannot be justified on purely empirical grounds (that is, using only phenomenal experience and/or observation).

But justification is not always purely empirical: logicians, mathematicians, linguists and philosophers rely heavily on *intuitions* in the justification of their theories. (Quine himself relies on intuition in defending his formulations of set theory over others.) And there are no convincing arguments that such use of intuitions is illegitimate. Once one acknowledges intuitive evidence, the necessary/contingent distinction has a straightforward justification: we have a very wide range of robust modal intuitions (for example, the intuition that it is contingent that the number of planets is greater than seven - there could have been fewer), and when such intuitions are taken as evidence, the best theory is one which accepts the distinction at face value.

The necessary/contingent distinction is a metaphysical distinction. The a priori/a posteriori distinction, by contrast, is epistemological. Indeed, Kripke and Putnam have convincingly argued that there are necessary truths (Hesperus is Phosphorus, water is H_2O, and so on) which are impossible to justify a priori (see Kripke, S.A. §3; Putnam, H. §3). While the former distinction might well lack a non-circular analysis, the latter certainly has one: *p* is a piece of a posteriori evidence if and only if *p* is the content of an experience (a phenomenal experience, observation, memory or testimony); *p* is a piece of a priori evidence if and only if *p* is a piece of evidence which is not the content of an experience in the relevant sense. (On the assumption that one's intuitions are evidence, the contents of those intuitions would constitute one's a priori evidence.) A theory has an a posteriori justification if and only if the evidence on which that justification is based is a posteriori; a theory has an a priori justification if and only if the evidence on which that justification is based is a priori. Note that this sort of analysis does not presuppose that any theory has an a priori justification; one could deny that there is any a priori evidence. The point is that, contrary to Quine's allegation, the *notion* of a priori justification has a straightforward analysis (see A posteriori; A priori).

Quine seems to assume that a priori judgments would need to be infallible and unrevisable. But this is mistaken, as is evident from our ongoing a priori theorizing about the logical paradoxes. One of the main traditional lines of thought on the a priori - from Plato to Gödel - recognizes that a priori justification is fallible and holistic, relying on dialectic and/or a priori theory construction.

3 Defending 'analytic' against Quine

Unlike 'necessary', 'analytic' is a technical term. Accordingly, it is legitimate to demand, as Quine (1951) does, that its use be explained. This could be done with examples, but none of the (nonequivalent) notions listed above fits the standard examples perfectly, nor does any stand out as *the* most salient. This leaves the alternative of giving a definition. Quine's view is that *not one* of the historically prominent uses of 'analytic' (except the 'logical truth' use) has a satisfactory definition. But this radical scepticism is unwarranted.

Consider the following definition: a necessarily true sentence is analytic if and only if it may be converted into a logically true sentence by replacing its syntactically simple predicates with predicates which mean exactly the same thing. This seems to respect the idea that analytic truths are a priori and moreover are justifiable in a specially simple way. Quine (1960) would object to this definition by appeal to his thesis of the indeterminacy of translation - the thesis that 'there is no fact of the matter' concerning claims about identity of meaning (see Radical translation and radical interpretation §§1-3). His arguments for this thesis have not convinced many philosophers, however, for they depend on quasi-verificationist or behaviourist premises. Most philosophers reject Quine's scepticism about meaning, realism having become the dominant view. One reason for this is the advent of the broadly Gricean picture (Grice 1989) according to which meaning is analysable in terms of the propositional attitudes. Accordingly, if there is a fact of the matter about the latter, there is about the former (see Communication and intention). And, since the cognitivist revolution in psychology and philosophy of mind, nearly everyone is a realist about propositional attitudes. Thus, at least one use of 'analytic sentence' ought to be acceptable to these realist philosophers.

The same moral holds for at least certain uses of 'analytic' as it applies to propositions. Despite Quine's scepticism, most philosophers have become convinced that in logic, psychology and semantics there is need for structured propositions, that is, propositions which have a logical form (or sense structure). This makes possible a definition of 'analytic' in another one of its standard uses (Katz 1986; Bealer 1982): *p* is analytic iff_{def} every proposition having the same form (structure) as *p* is necessary.

4 More damaging problems with ‘analytic’

Although the above definition of ‘analytic’ is cogent, the term so-defined fails to apply to a number of examples which traditionally would have been deemed ‘analytic’; the definition is too narrow. For example, the defined use does not cover Kant’s paradigm example of an analyticity, namely, that bodies are extended. To accommodate this and a wide array of other examples (that circles are curves and so forth; see below), one must turn to a wider definition of ‘analytic’ - one relying on some philosophically robust notion such as definition, conceptual analysis, or the kind of meaning relations which hold between a definiendum and a definiens or between an analysandum and an analysans. For example, it is at least credible that there is a definition of ‘body’ in one of its senses according to which ‘Bodies are extended’ would be true by definition. Unfortunately, these wider accounts of ‘analytic’ give rise to a complementary problem: they let in too much.

The following familiar definitions illustrate the problem: *x* is a circle if and only if *x* is a closed plane figure every point on which is equidistant from a common point; *x* is a circle if and only if *x* is a closed plane figure every arc of which has equal curvature. There seems to be nothing to recommend one over the other; if either is a correct definition, both are. In that case it seems that the following would be true by definition plus logic: *x* is a closed plane figure every point on which is equidistant from a common point if and only if every arc of *x* has equal curvature. But Kant would deem this biconditional ‘ampliative’: in any standard axiomatic formulation of geometry, the proof of it would require axioms and axioms - as opposed to definitions - are supposed to be synthetic. Evidently, this argument can be adapted to many other a priori necessities traditionally thought to be paradigmatically synthetic.

A related kind of problem arises in connection with conceptual analysis. One of the most celebrated conceptual analyses in mathematical philosophy is the classical analysis of effective calculability, or computability. On Church’s version, a function is effectively calculable if and only if it is lambda-calculable. On Turing’s version, a function is effectively calculable if and only if it is Turing computable (see Church’s thesis). Most philosophers deem each version to be a successful conceptual analysis. But when the two analyses are combined, it follows immediately that a function is recursive if and only if it is Turing computable. But this biconditional - which is an important ‘ampliative’ theorem of formal number theory - would then turn out to be analytic (in the sense of being true by conceptual analysis plus logic) even in the event that logicism is false.

These problems suggest that there is no coherent way to draw an analytic/synthetic distinction along the lines Kant thought. One response is to settle for a severely restricted use of ‘analytic’ which concerns only concepts with unique structures (that is, unique ‘decompositions’). The price of this move, however, is high: the vast majority of our concepts - including nearly all of the concepts philosophers have sought to define or analyse (good, true, valid, number, meaning, knowledge, and so on) - are in this sense unstructured and so would not give rise to new analyticities. At best, rather uninteresting concepts (such as bachelor) are of this sort. In consequence, even if knowledge of analyticities (in the narrow sense) had a transparent epistemic explanation as Kant assumed, the sort of knowledge one seeks in typical philosophical definitions or analyses would need quite another sort of explanation.

5 Epistemological problems with ‘analytic’

Kant and his successors simply assumed that knowledge of analyticities has a transparent sort of explanation (often linked to a simplistic ‘pictorial’ or ‘mereological’ view of concepts). Just what that explanation is supposed to be has never been satisfactorily stated. It cannot be that analytic propositions are those whose truth is recognized just by virtue of possessing the constituent concepts, for *no* proposition is like this. For example, it is in principle possible that someone who possesses the relevant concepts but who is in sufficiently defective cognitive conditions (deficient intelligence, attentiveness, and so on) might fail to recognize that all and only bachelors are unmarried men. It does no good to relax this account by holding that analytic propositions are those whose truth would be recognized by anyone in sufficiently good cognitive conditions just by virtue of possessing the constituent concepts, for this lets in too much: anyone in sufficiently good cognitive conditions could not fail to recognize, say, that figure *A* is congruent with figure *B* if and only if *B* is congruent with *A*. But such propositions are the very paradigms of what Kant would have deemed synthetic a priori and requiring a different sort of explanation. (For these same reasons, purely epistemic definitions of ‘analytic’ are problematic.)

Another line of explanation is to liken our knowledge, say, that bachelors are men to our knowledge that unmarried men are men, or more generally, that *AB*s are *B*s - that is, to liken this knowledge to our knowledge of a certain kind of *logical* truth. But how do we know the logical truth that *AB*s are *B*s? Is the explanation fundamentally different from the explanation of our knowledge of other kinds of logical truths - for example, that *B*s are *A*s or *B*s? It is hard to see why it should be. This raises the question of how we know logical truths generally. For instance, is the explanation of our (logical) knowledge that identity is a symmetric relation ($A = B$ iff $B = A$) really different from the explanation of our (nonlogical) knowledge that congruence is a symmetric relation? From a phenomenological point of view, both instances of knowing (logical and nonlogical) arise from a priori intuitions and these intuitions, phenomenologically, are not relevantly different. On this score, therefore, there is no reason to think that our a priori knowledge divides neatly into two kinds having quite different explanations.

On the contrary, there is a promising unified explanation of a priori knowledge generally, which goes roughly as follows. In every case a priori knowledge is based evidentially on a priori intuition. The evidential force of a priori intuition is to be explained in terms of a general analysis of concept possession: it is constitutive of concept possession that in suitably good cognitive conditions intuitions regarding the behaviour of the concept need to be largely correct. If in suitably good cognitive conditions one did not have such intuitions, one would not be said to possess the concept. If something like this is right, then, although they mark cogent logical and metaphysical distinctions, all the listed uses of ‘analytic’ - even the narrow uses - fail to mark an epistemically significant category of knowledge.

The picture that results is complicated somewhat by Kripke and Putnam’s doctrine that there are essentially a posteriori necessities - for example, water = H_2O. Among these are some which may plausibly be deemed *scientific definitions*. If ‘analytic’ is used in the sense of truth by definition plus logic, where ‘definition’ is understood to include scientific definitions, then there would be necessities which would be both analytic and essentially a posteriori. Evidently the Kripke-Putnam doctrine applies only to ‘semantically unstable’ expressions - that is, expressions (‘water’, ‘gold’, ‘heat’, and so on) whose meaning could be different in some population of speakers whose epistemic situation is qualitatively identical to ours. These are expressions to whose meaning the external environment makes some contribution (see Content: wide and narrow). The above picture, however, holds straightforwardly for semantically stable expressions (‘conscious’, ‘know’, ‘good’, and so on) which loom large in philosophical analysis.

6 Whither ‘analytic’?

At this stage, one may reasonably ask whether continued use of ‘analytic’ serves any purpose in philosophy. Although the term evidently lacks the epistemological significance once attributed to it, the wider use of ‘analytic’ in the sense of true by definition plus logic still has utility, namely, in posing an important question: Are there necessary truths (supervenience principles, the incompatibility of colours, and so on) which are not analytic in this sense? The answer appears to be affirmative if ‘definition’ is understood straightforwardly as ordinary explicit definition. But if, as some have proposed, ‘definition’ is understood to include ‘implicit definitions’, the answer is controversial and depends on what information may legitimately be loaded into ‘implicit definitions’. On pain of trivializing significant traditional questions, however, surely not everything is admissible. Plainly there still are unanswered questions here. But they are really about the nature of definitions; ‘analytic’ does no work.

Anaphora

Anaphora describes a dependence of the interpretation of one natural language expression on the interpretation of another natural language expression. For example, the pronoun 'her' in (1) below is anaphorically dependent for its interpretation on the interpretation of the noun phrase 'Sally' because 'her' refers to the same person 'Sally' refers to.

(1) Sally likes her car.

As (2) below illustrates, anaphoric dependencies also occur across sentences, making anaphora a 'discourse phenomenon':

(2) A farmer owned a donkey. He beat it.

The analysis of anaphoric dependence has been the focus of a great deal of study in linguistics and philosophy. Anaphoric dependencies are difficult to accommodate within the traditional conception of compositional semantics of Tarski and Montague precisely because the meaning of anaphoric elements is dependent on other elements of the discourse.

Many expressions can be used anaphorically. For instance, anaphoric dependencies hold between the expression 'one' and the indefinite noun phrase 'a labrador' in (3) below; between the verb phrase 'loves his mother' and a 'null' anaphor (or verbal auxiliary) in (4); between the prepositional phrase 'to Paris' and the lexical item 'there' in (5); and between a segment of text and the pronoun 'it' in (6).

(3) Susan has a labrador. I want one too.
(4) John loves his mother. Fred does too.
(5) I didn't go to Paris last year. I don't go there very often.
(6) One plaintiff was passed over for promotion. Another didn't get a pay increase for five years. A third received a lower wage than men doing the same work. But the jury didn't believe any of it.

Some philosophers and linguists have also argued that verb tenses generate anaphoric dependencies.

1 Syntactic and static semantic approaches

An expression is 'anaphoric' if it depends for its interpretation on the interpretation of another expression. For example, the pronoun 'her' in (1) below is anaphorically dependent on the noun phrase 'Sally'.

(1) Sally likes her car.

Anaphoric dependencies also occur across sentences, making anaphora a discourse phenomenon:

(2) A farmer owned a donkey. He beat it.

Though anaphoric dependencies are a semantic phenomenon, syntax has a very important role to play in their analysis. In the early sixties, syntacticians noticed that anaphoric dependencies were subject to peculiar constraints that syntax could explain. For instance, consider (3) and (3′):

(3) John hit himself.
(3′) John hit him.

In (3) 'John' and 'himself' must refer to the same thing (they must be 'coreferential'), while in (3′) 'John' and 'him' cannot do so. Such observations prompted Chomsky (1981) to devise a theory of binding for anaphoric expressions, whereby all noun phrases in the syntactic representation are assigned an index. Reflexive pronouns are subject to a constraint that forces 'himself' in (3) to be co-indexed with and so bound to some noun phrase (NP) that occurs within the same clause, while nonreflexive pronouns obey another constraint that implies that 'him' in (3′) cannot be bound by an NP within the same clause in which it occurred.

While Chomsky and other syntacticians recognized that there is a semantic component to anaphora, they never

clearly articulated the semantic interpretation of co-indexed and non-co-indexed NPs. Semantics furnishes a translation of a syntactic structure into a logical representation, a ‘logical form’, that can then be assigned a model-theoretic interpretation using the formal semantics for the logical representation language, typically the language of first-order or higher-order logic (see Model theory). The syntactically generated indices on NPs are interpreted as indices on variables. Pronouns introduce an indexed variable in the logical form, while noun phrases introduce a generalized quantifier, which in turn introduces a bound variable with the index of the NP. The quantifier binds all occurrences of the same variable in its scope. So a sentence such as (1) can be represented as follows:

(1′) $\exists x_j \exists x_i(x_i =$ Sally & car(x_j) & owns(x_i, x_j) & likes(x_i, x_j)).

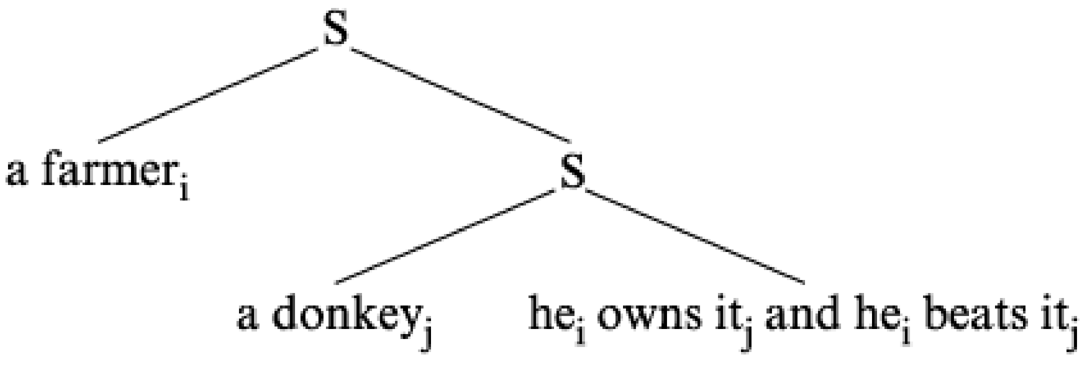
This approach works well enough for the simple cases of intra-sentential anaphora. But anaphoric links between pronouns and their antecedents also occur across sentences. For example, in giving the logical form of (2) above, anaphoric pronouns cause a problem. Formally, the first sentence yields (ignoring tense):

(2a) $\exists x$(farmer(x) & $\exists y$(donkey(y) & owns(x, y))).

We now tackle the second sentence. The pronouns in the second sentence are anaphorically bound to the noun phrases in the first sentence, and so we should translate the pronouns as variables that are to be bound by the quantifiers introduced by the noun phrases in the first sentence. But we have already finished the translation of the first sentence and so closed off the rightward scope of the quantifiers. Conjoining the translation of the second sentence does not produce a bound variable reading of the variables introduced by the pronouns. It produces an open sentence:

(2′) $\exists x$(farmer(x) & $\exists y$(donkey(y) & owns(x, y))) & beats(x, y).

Montague Grammar (see Montague, R.M.) seems to solve this problem with the procedure of ‘quantifying in’ (Gamut 1991). We first postulate a syntactic rule on which the noun phrase is replaced in the syntactic tree by a pronoun with an appropriate index, and the original noun phrase is adjoined with the sentence. We then apply the Montague Grammar translation procedure. Now if we interpret a sequence of two sentences as a conjunction, we can then use the quantifying-in procedure to interpret (2). First, we quantify in the two noun phrases ‘a farmer’ and ‘a donkey’. The syntactic rule for quantifying in produces the following structure for (2):



This tree now yields in Montague Grammar the correct logical form for (2):

(2*) $\exists x_j \exists x_i$(farmer(x_i) & donkey(x_j) & owns(x_i, x_j) & beats(x_i, x_j)).

However, if we wish to continue to use the procedure of quantifying in to deal with discourses in which anaphoric linkage to an antecedently occurring noun phrase exists over multiple sentences as in (4), then we must suppose a complete syntactic analysis of the discourse prior to the interpretation of any of its constituent sentences.

(4) A farmer owned a donkey. He beat it. It ran away.

This conclusion is not cognitively plausible and suggests that the Montague approach to anaphora is wrong. There are other difficulties too. Anaphoric dependencies across attitude contexts such as that between ‘a witch’ and ‘she’ in (5) below are also difficult to treat for Montague Grammar without assuming a *de re* reading of the attitude

reports (see further Geach 1963).

(5) Hob believes that a witch blighted his mare. Nob believes she killed his cow.

2 Dynamic semantics

Kamp (1981) and Heim (1982) independently proposed a formal and rigorous solution to the problem of anaphoric pronoun interpretation that has come to be called ‘dynamic semantics’. The solution redefines the semantic contribution of a sentence to the content of a discourse. In Montague Grammar, the contribution of a sentence is a proposition - formally, a set of possible worlds in which the sentence is true (see Semantics, possible worlds). Such a proposition contributes to the content of a discourse in a simple way: the meaning of a discourse is just those possible worlds that are in the intersection of all the propositions that are the meanings of the discourse’s constituent sentences. In dynamic semantics, the interpretation of a sentence *S* is a function from a discourse context to another discourse context. Such contexts may be understood in different ways (see Barwise 1987, Groenendijk and Stokhof 1991, Webber 1978). Sketched below is Kamp’s approach to discourse semantics, ‘Discourse Representation Theory’ or DRT.

A discourse context in DRT contains a set of discourse entities or ‘discourse referents’ to which elements of subsequent discourse may refer. DRT assigns a truth-conditional meaning to a natural language discourse in two steps. First, we construct a representation of the content of the discourse known as a ‘discourse representation structure’ or DRS. Second, we embed a DRS in a Tarskian model of the sort familiar from first-order logic to provide truth-conditions. A DRS is naturally construed as a partial model and conceptual representation of the discourse. It consists of a pair of sets: a set of discourse referents, or universe; and a set of conditions. The universe of a DRS is analogous to the domain of a partial model; it contains the objects (discourse referents) talked about in the discourse. Conditions are property ascriptions to these discourse referents (Asher 1993). DRSs as partial models should be distinguished from the language used to describe them. The DRS language uses a box notation - the upper part of the box lists the discourse referents in the universe of the DRS, while the lower part of the box describes the conditions. For instance, the DRS for ‘a farmer owns a donkey’ is given below. It tells us that the discourse speaks of two entities, one a farmer (*x*), the other a donkey (*y*), and that the farmer owns the donkey.

(K2a)

$$\begin{array}{|c|}\hline x \quad y \\ \hline \text{farmer}(x) \\ \text{donkey}(y) \\ \text{owns}(x, y) \\ \hline \end{array}$$

(Wada and Asher (1986), Zeevat (1989) and Asher (1993) develop a construction procedure whereby each lexical element contributes some sort of DR-theoretic structure. These then combine together compositionally following the syntactic structure of the sentence to produce a DRS for the sentence.) A noun phrase such as ‘a farmer’ introduces a novel discourse referent into the DRS as well as a condition on that discourse referent, while verbs introduce conditions on the discourse referents introduced by the noun phrases that constitute their syntactic arguments. Anaphoric pronouns, following the original Kamp treatment of DRT in 1981, are treated analogously to bound variables; they introduce occurrences of discourse referents that have been introduced previously by the processing of noun phrases in prior discourse.

The construction of a DRS for a discourse proceeds incrementally, exploiting the syntactic parse of each sentence. If $\tilde{\mathbf{K}}$ is the DRS derived from the first *n* sentences and K_{n+1} is the DRS derived from the sentence $n+1$, then the DRS for the $n+1$ sentence discourse is just the DRS that combines the universes of $\tilde{\mathbf{K}}$ and K_{n+1} and their condition sets:

$$\langle(\mathrm{U}_{\tilde{\mathbf{K}}} \cup \mathrm{U}_{\mathrm{K}_{n+1}}), (\mathrm{Con}_{\tilde{\mathbf{K}}} \cup \mathrm{Con}_{\mathrm{K}_{n+1}})\rangle.$$

So in constructing a DRS for (4), for example, we would add to the DRS K2a above the conditions ‘beats(*x*, *y*)’ and ‘runs away(*y*)’ to get a DRS for (4):

(K4)

$x \quad y$
$\text{farmer}(x)$
$\text{donkey}(y)$
$\text{owns}(x, y)$
$\text{beats}(x, y)$
$\text{runs away}(x, y)$

DRT solves another problem for Montague Grammar, having to do with indefinites, pronouns and conditionals. In Montague Grammar (as for Frege), the noun phrase ‘a man’ contributes a property of properties - that is, the property of some property *P* that there is some man that has *P* or, in symbols, $\lambda P \exists x(\text{man}(x) \ \& \ P(x))$. But then how do we account for the contribution of ‘a farmer’ in (6)?

(6) If a farmer owns a donkey, he beats it.

If we translate ‘a farmer’ with the existential quantifier, we must assign it wide scope over the conditional in order to bind the variable introduced by ‘he’ which is intuitively linked to ‘a farmer’. But this gives (6) incorrect truth-conditions. (6) requires the following translation for ‘a farmer’:
$\lambda P \forall x(\text{farmer}(x) \rightarrow P(x))$.

Montague Grammar has no uniform translation of the indefinite determiner that yields a correct treatment of (2) and (6), and also fails to explain why its translation of indefinites is context sensitive in this way. DRT, however, has a uniform translation. DRT uses its analysis of indefinite noun phrases and pronouns, together with construction procedures for conditionals and universally quantified NPs. Both constructions introduce what is known as a ‘complex condition’ in a DRS; complex conditions consist of DRSs as arguments to some operator. For instance, the grammatical conjunction ‘If…, then… ’ introduces the following relation on DRSs:

$\lambda K \lambda K'$

$K \quad \Rightarrow \quad K'$

When we have two clauses linked by ‘If…, then… ’, the first clause gives us a DRS replacing the variable *K*, while the second gives us a DRS replacing *K′*. For example, if we choose the right discourse referents for the pronouns ‘he’ and ‘it’, we translate (6) as in the DRS below, using a uniform treatment of indefinites, conditionals and pronouns.

(K6)

$x \quad y$		
$\text{farmer}(x)$ $\text{donkey}(y)$ $\text{owns}(x, y)$	$\Rightarrow$	$\text{beats}(x, y)$

As K6 shows, DRSs can occur within DRSs. DRT postulates a constraint on anaphora called ‘accessibility’ which exploits these complex structures. A discourse referent ‘ α’ is accessible from a condition ‘ β’ if and only if ‘ α’ is declared in the universe of a DRS that either contains ‘ β’ or a DRS containing ‘ β’, or is the antecedent of a conditional ‘ $\Rightarrow$’ of which the DRS containing ‘ β’ is the consequent. We may translate a pronoun with the discourse referent ‘ α’ only if ‘ α’ is accessible to the conditions of which the pronoun is the argument. This means that DRT predicts some anaphoric connections to be semantically incoherent - for example, as in ‘If a farmer $_i$ owns a donkey, he $_i$ beats it. *He $_i$ is fined’.

3 Dynamic semantics (cont.)

Let us now briefly discuss the correctness definition for DRSs. The correctness definition tells us what conditions must obtain in order for a DRS to be properly embedded in a 'DRS model'. These are the truth-conditions for the discourse the DRS represents. A DRS model is a pair $\langle D, I \rangle$, where *D* is a non-empty set (a domain of individuals) and *I* is a function that assigns to atomic *n*-ary conditions of DRSs *n*-tuples from D^n. Atomic conditions are those conditions that are derived from natural language nouns, verbs and some adjectives - the sort that are contained in the DRSs for (2) and (6). A DRS *K* is properly embedded in a DRS model *M* if and only if there is a function from U_K into the universe of *M* such that all the conditions of *K* are satisfied in *M*. What we have to do now is to define satisfaction of a condition in *K*. For atomic DRS conditions, the definition of satisfaction is completely analogous to the satisfaction of an atomic formula of first-order logic relative to a model and an assignment to free variables. The recursive definition for, for example, complex conditions of the form $K \Rightarrow K'$, however, is novel, reflecting the quantificational force of '$\Rightarrow$'. $K \Rightarrow K'$ is satisfied in a DRS model *M* relative to an embedding function *f* if and only if for every function *g* that extends *f* to a proper embedding of *K* in *M* there is an extension *h* of *g* that is a proper embedding of K' in *M*.

In applying the correctness definition to K4, we get the intuitively right truth-conditions for the sentence. The function *f* is a proper embedding of K4 just in case there is an object *a* and an object *b* such that *a* is a farmer, *b* is a donkey, *a* owns *b*, *a* beats *b*, and *b* runs away. The correctness definition also captures the truth-conditions of a conditional sentence such as (6) - for more details see Kamp and Reyle (1993).

Since its introduction, DRT and other theories of dynamic semantics have been used to analyse various anaphoric phenomena - for example, plural anaphora (Kamp and Reyle 1993), anaphora across attitude contexts (Asher 1987), temporal anaphora (Kamp and Rohrer 1983, Kamp and Reyle 1993) and verb phrase (VP) ellipsis (Klein 1986).

DRT makes an important contribution to our understanding of anaphora. But there are problems. DRT's approach to anaphors and quantification sometimes fails to get the right readings in examples such as the following:

(12) If I have a dime in my pocket, I'll put it in the meter.

DRT predicts that every dime I have in my pocket will be put in the meter, a prediction that must somehow be blocked. Sentences involving pronouns and other quantifiers yield similar difficulties. (13) casts doubt on a basic principle of both Montague Grammar and DRT; the 'it' in (13) does not seem to function as a bound variable but rather as a definite description (Evans 1980).

(13) Either there's no bathroom in this house, or it's in a funny place.

Yet another difficulty for the DRT account of anaphora is that it cannot handle many cases of propositional anaphora. DRT does not offer for (14), for instance, any entities of the appropriate type to which 'it' can refer.

(14) One plaintiff was passed over for promotion. Another didn't get a pay increase for five years. A third received a lower wage than men doing the same work. But the jury didn't believe any of it.

One approach to propositional anaphora such as that in (14) has been to analyse in greater detail the discourse structure of a text. Interpreters naturally understand a text as divided into meaningful segments related in various ways. Some parts give a narrative; others furnish a background for a narrative; still others may elaborate or explain other parts. Such discourse structure is completely missing from DRT, but Asher (1993) and Webber (1991) argue that these parts of the text can serve as referents to anaphoric pronouns. Notions of discourse structure have been incorporated into a dynamic-semantic framework (Asher 1993) to analyse propositional anaphora, VP ellipsis and temporal anaphora (Lascarides and Asher 1993).

Anarchism

Anarchism is the view that a society without the state, or government, is both possible and desirable. Although there have been intimations of the anarchist outlook throughout history, anarchist ideas emerged in their modern form in the late eighteenth and early nineteenth centuries in the wake of the French and Industrial Revolutions.

All anarchists support some version of each of the following broad claims: (1) people have no general obligation to obey the commands of the state; (2) the state ought to be abolished; (3) some kind of stateless society is possible and desirable; (4) the transition from state to anarchy is a realistic prospect

Within this broad framework there is a rich variety of anarchist thought. The main political division is between the 'classical' or socialist school, which tends to reject or restrict private property, and the 'individualist' or libertarian tradition, which defends private acquisition and looks to free market exchange as a model for the desirable society. Philosophical differences follow this division to some extent, the classical school appealing principally to natural law and perfectionist ethics, and the individualists to natural rights and egoism. Another possible distinction is between the 'old' anarchism of the nineteenth century (including both the classical and individualist traditions) and the 'new' anarchist thought that has developed since the Second World War, which applies the insights of such recent ethical currents as feminism, ecology and postmodernism.

Anarchists have produced powerful arguments denying any general obligation to obey the state and pointing out the ill effects of state power. More open to question are their claims that states ought to be abolished, that social order is possible without the state and that a transition to anarchy is a realistic possibility.

1 Philosophical anarchism

A common starting point for anarchists is 'philosophical anarchism', the denial of any general duty in the individual to obey the laws of the state. The best-known formulation of this view is that of R.P. Wolff (1970), who argues that any such claim of duty comes into conflict with the individual's moral autonomy (see Autonomy, ethical). People who accept a duty to act merely because the state has so commanded thereby surrender their capacity to judge the rightness of actions for themselves. Assuming that moral autonomy should never be surrendered, a general duty to obey the state (regardless of the content of its command) is inadmissible. This argument is a strong one, but from a genuinely anarchist point of view its implications are limited. Even if one should not act merely because the action has been commanded by the state, there may be good reason, acceptable to an autonomous agent, to comply with the state's command in particular cases. Philosophical anarchism is consistent with accepting the state's continued existence. It is at best a necessary, not a sufficient, element of a full anarchist case.

2 Abolition of the state

Full-blooded anarchism involves the claim that the state should be abolished. Anarchists have advanced several lines of argument to this end.

First, a utilitarian case might be made, in the manner of Godwin, the earliest systematic writer in the 'classical' anarchist tradition (Crowder 1991) (see Godwin, W. §3). For Godwin, the disutility of government results, first, from its support for 'the established administration of property', which diminishes the sum of human happiness by dividing society into unequal and antagonistic classes; second, from its tendency to overreach the limits of its competence (Godwin 1798). Utility requires that goods be distributed so as to bring about the greatest happiness, and that people's affairs be left to those most familiar with them, namely the individuals themselves (see Utilitarianism).

A second line of argument is also found in Godwin: perfectionism (see Perfectionism). Anticipating J.S. Mill, Godwin sees 'the perfection of which human nature is capable' as involving the development of a robustly autonomous personality. Government, however, by its very nature tends to crush or undermine this kind of autonomy, either by coercion, or by encouraging an attitude of servile obedience or by upholding relations of economic inequality that place one class at the mercy of another. Government must thus be abolished, as an obstacle to the realization of true humanity. A similar element of perfectionism is present in all the classical

anarchists. In Bakunin, Kropotkin and others, the influence of the romantic movement is apparent in their insistence that perfection requires the development of individual uniqueness. This is an emphasis popular among contemporary anarchists, but in the classical texts the promotion of personal idiosyncrasy is usually circumscribed by a prior commitment to some conception of a universal moral law.

This latter insistence suggests a third ground of opposition to the state, the assumption, again characteristic of the classical anarchists, that there is an objective moral law somehow immanent in or deducible from nature. This group thus subscribes to the notion of natural law (see Natural law §3). As to the precise form and content of natural law they offer different accounts, but all agree that it is violated by the state. Closest to the traditional Thomistic notion of natural law as the command of God is the view found put forward by Lev Tolstoi (Tolstoi 1936). For Tolstoi, the content of the moral law is Christian, centring upon the idea of universal brotherhood and the command to love one’s neighbour. These imperatives, Tolstoi believes, are incompatible with the existence of states, since states set up barriers of enmity between people by creating false national identities and shoring up class distinctions.

Tolstoi is the only major anarchist thinker to adopt an explicitly theistic and Christian foundation; the general self-image of the anarchists is militantly antireligious, an outlook exemplified by Bakunin’s (1882). The most fully worked out account of natural law along these secular lines is found in the work of Kropotkin, who takes his cue from Darwinian evolution. In opposition to ‘social Darwinists’ like Herbert Spencer, Kropotkin (1902) argues that the dominant factor of evolutionary development is not competition but ‘mutual aid’ within species (see Evolution and ethics). The state must be abolished because, divisive and hierarchical, it constitutes an obstacle to humanity’s conforming with this law of nature. Once government is removed, nature can be expected to take its course, ushering in a new era of universal cooperation and brotherhood.

In the individualist tradition, the natural law style of argument against the state takes the form of claims to natural rights. Murray Rothbard (1973), for example, argues that the kind of rights defended by John Locke - rights, rooted in human nature, to security of person and possessions - are incompatible with the state. Government, by its very nature, violates people’s rights by coercing them in various ways, including the taxation of their property. Although it might be replied that government is also capable of protecting the individual’s rights, the individualist anarchist response is that such protection is provided only at the cost of invading rights in other respects. This is impermissible, since natural rights are absolute. (A similar argument is made by ‘minimal state’ liberals like Robert Nozick (see Libertarianism §3; Nozick, R.).)

Another line of individualist argument appeals to self-interest. Ethical egoism, the view that people ought to prefer their own self-interest to any other principle of conduct, was first developed in an anarchist direction by the Young Hegelian Stirner. Extending Feuerbach’s argument against religion to strike at all notions of ‘the sacred’, Stirner (1845) argues that people’s potential for self-realization is impeded by the very idea of ethical obligation. Among the various ‘spooks’ that restrict our lives at present, the state, with its demand for obedience, is one of the most oppressive. The state is not the sacred institution we suppose it to be, but merely an especially pervasive agency of violence and coercion. Self-interest demands that we dismantle it.

These arguments may be challenged on many points. For example, the anarchist arguments based on natural law and natural rights may be thought to illustrate some familiar problems with those doctrines, such as the apparent arbitrariness of the content attributed to them (see Natural law §5). Kropotkin does not adequately justify his emphasis on mutual aid rather than competition; Rothbard’s natural rights are narrowly defined to exclude the possibility of ‘positive’ rights to welfare assistance of the kind historically associated with government intervention. More generally, all these anarchist arguments may be accused of a certain one-sidedness. Taken by themselves, the anarchists’ criticisms of the state are often powerful, but their attacks are seldom balanced by any fair consideration of points in government’s favour. The tendency is to set out a vivid catalogue of the evils of which the state is capable, and to leave the argument at that.

3 Types of anarchy

After the attack on the state, the next step in the anarchist case is the presentation of some account of the stateless society as a desirable alternative. The general picture anarchists present varies from case to case; their different grounds of opposition to government imply different values to be promoted in anarchy. At one extreme is

Kropotkin's vision of a society characterized by voluntary mutual aid, at the other Stirner's conception of a 'union of egoists' in which the only constraints on people's conduct will be the limits of their personal power.

A major source of contrast between different anarchies is the issue of how goods should be distributed. Roughly speaking, the classical tradition argues for the rejection or restriction of private property; the individualist school defends it, looking to market exchange as its central model of social relations. The dominant view in the classical tradition is Kropotkin's 'communist' anarchism, which requires distribution according to need (see Communism). At the other end of the spectrum, contemporary individualists like Rothbard reject virtually all restrictions on the operation of the market, and are happy to accept the label 'anarcho-capitalist'. On this view, even services traditionally performed by governments, such as law enforcement and defence, should be voluntarily purchased from private suppliers. An intermediate position is occupied by Proudhon's 'mutualism' (see Proudhon, P.-J.), under which goods are to be distributed by free contract, with the strong qualification that prices be fixed according to units of labour-time. The good society would thus be one in which all would work, and each (assuming roughly equal abilities and industry) would receive roughly similar rewards (Proudhon 1923).

The many difficulties faced by all of these schemes lead to a general problem with conceptions of anarchy, that of how to ensure social order in the absence of the familiar enforcement machinery of the state. Here again there are several different proposals. Confronted by the problem of crime, most classical anarchists first suggest that there will be very much less crime in the absence of private property and its associated inequalities. But assuming the likelihood of at least occasional criminal acts and, more generally, interpersonal disputes, they part company over the best response. For some, such problems will be solved by an eventual universal convergence of ethical judgment brought about by either or both of the following: (1) the release (especially through revolutionary comradeship) of natural feelings of solidarity hitherto suppressed by artificial state-imposed divisions; (2) an improvement in rational understanding of ethical obligations resulting from advances in the natural and social sciences. A second response to the problem of order is the device of public censure, under which people will be brought into line by the pressure of public opinion. Third, some individualists are happy to endorse a system of courts and coercive enforcement, as long as this is maintained by voluntarily paid subscription.

4 Theories of transition

A perennial difficulty in anarchist thought is the question of how society can pass from the existing state system, apparently well entrenched, to the future stateless order. It was principally on this point that the anarchist and Marxist streams of nineteenth-century socialism eventually diverged (see Socialism). Anarchists like Bakunin rejected the Marxist notions of a vanguard party and a transitional period of revolutionary government on the ground that these devices are incipiently authoritarian, and in this they may appear prescient. But the price of their consistency is that they are left to formulate a plausible alternative.

Some anarchists insist on strictly nonviolent means, relying on rational enlightenment (Godwin) or religious reawakening (Tolstoi). Bakunin and Kropotkin emphasize the role of science in promoting progress through rational agreement. Individualists like Tucker (1972) are generally committed to nonviolence, allowing at most passive forms of civil disobedience such as refusing to serve in the armed forces or to pay taxes.

Alongside these irenic views, and sometimes awkwardly combined with them, there is also a strong commitment in some anarchists (Proudhon, Bakunin, Kropotkin) to revolutionary action (see Revolution). All these thinkers agree in principle that the anarchist revolution must be spontaneous or 'bottom-up' rather than subject to any kind of leadership that could evolve into a government. There are, however, various proposals for ways of stimulating the revolution without actually leading it. 'Anarcho-syndicalists' believe that the revolution is to be advanced by direct industrial action culminating in a general strike (Rocker 1938). The school of 'propaganda by deed' urges that the insurrection be inspired by sudden, symbolic acts of anti-bourgeois terrorism. The resulting popular association of anarchism with arbitrary violence is, however, unfair and misleading. It is true that some anarchists, like Bakunin, place an emphasis on the violent destruction of the existing order that sometimes goes beyond the recommendation of a necessary means to an end and becomes a form of self-affirmation held to be valuable in itself. But this tendency is not distinctively anarchist, and neither follows from nor fits comfortably with the most fundamental anarchist principles, which give priority to autonomous judgment and ethical restraint.

5 The 'new' anarchism

The anarchists' principled repudiation of governmental organization even for the purposes of revolution is one of several factors that contributed to the eclipse of anarchism as a political force after the Second World War. Against a background of expanded welfare states in the West and state socialist hegemony in the East, the inheritors of the classical tradition in particular were challenged to revise their thinking. The results have been described as a 'new' generation of anarchist thought (Runkle 1972).

Not surprisingly, some post-war anarchists (see, for example, Ward 1973) have retreated from theories of comprehensive social transformation, concentrating instead on developing spheres of individual and small-group autonomy in the interstices of existing state structures. In this connection, existentialist approaches to anarchism have been developed (see, for example, Read 1954). More ambitious claims continue to be advanced, however. In the 1960s some anarchists were attracted to the apparently revolutionary potential of the 'situationist' ethic that emerged from the amorphous New Left movement (Debord 1983). However, current interest is for the most part focused on three main lines of thought: feminism, ecology and postmodernism.

Feminist anarchism, pioneered by Emma Goldman (1917), is the view that the state is a typical institution of patriarchy, an expression of the characteristic male ethic of impersonal 'justice' backed by violence. Women, in contrast, are said to be anarchists by nature, since female instincts and ideals - of sexuality and motherhood, for example - are non-hierarchical and anti-authoritarian. This claim is vulnerable to the same objections that attach to any 'essentialist' form of feminism, namely that evidence for distinctively male and female 'natures', and hence male and female ethics, is inconclusive (see Feminist political philosophy §5). That is not to rule out the more moderate claim that the historical experience of women gives them an interest in dismantling the state over and above the interest in doing so possessed by men.

The leading ecological anarchist, Murray Bookchin (1982), argues that the state expresses and reinforces a principle of hierarchy which, when applied to people's dealings with nature, encourages the view that humanity's proper relation to the natural world is one of control and conquest. The result is the devastation of our environment. The solution is the 'ecological society', which will be an anarchist society, since in repudiating the hierarchical values that threaten nature it will abandon the hierarchies that have oppressed human beings. To this it might be replied that it is far from obvious that a society that considers itself an equal partner with nature must be internally egalitarian; ecological goals might well be achieved - perhaps more easily achieved - through non-democratic institutions (see Green political philosophy §§1, 3).

Finally, the loosely defined tendency in contemporary thought known as 'postmodernism' may be thought suggestive from an anarchist point of view (May 1994). Michel Foucault's technique of undermining dominant value systems by laying bare the contingent and power-seeking genealogies underlying them implies a kind of liberation for those people previously controlled or marginalized by such systems. It is easy to see that notions of government, state and authority could be dismantled in this way. Less obvious is the possibility of passing from here to a positive recommendation of anarchism, since this too could be undermined by the same genealogical method. An anarchism based on postmodernism is conceivable, but it would probably be negative or destructive in tone (see Postmodernism and political philosophy).

Short of massive and unforseeable changes in world political and economic conditions, it is hard to see any of these more recent developments leading to a revival of anarchist influence at the level it enjoyed in the late nineteenth century. The present power of states, the pervasive influence of international capitalism and the widespread demand for the goods and services these institutions provide, all combine to make anarchism an unlikely political option. The new formulations testify, nevertheless, to the resilience of anarchist ideas and to their continuing role as correctives or counterweights to more conventional views.

Anaxagoras (500-428 BC)

Anaxagoras of Clazomenae was a major Greek philosopher of the Presocratic period, who worked in the Ionian tradition of inquiry into nature. While his cosmology largely recasts the sixth-century system of Anaximenes, the focus of the surviving fragments is on ontological questions. The often quoted opening of his book - 'all things were together' - echoes the Eleatic Parmenides' characterization of true being, but signals recognition of time, change and plurality. Even so, Anaxagoras is deeply committed to the Eleatic notions that, strictly speaking, there can be no coming into being or going out of existence, nor any separation of one part of reality from any other. His main object is to show how the variety of the world about us is somehow already contained in the primordial mixture, and is explicable only on the assumption that latent within each substance are portions of every other. Whether or not he owed his conception of unlimited smallness to Zeno of Elea, he held that there could be no such thing as a magnitude of least size; and he claimed that there was accordingly no difference in complexity between the large and the small.

Mind, however, is a distinct principle; unlimited, autonomous, free from the admixture of any other substance. Hence Anaxagoras' decision to make it the first cause of the ordered universe we now inhabit. Mind initiates and controls a vortex, which from small beginnings sucks in an ever-increasing expanse of the surrounding envelope. The vortex brings about an incomplete separation of the ingredients of the original mixture: hot from cold, dry from wet, bright from dark, and so on, with a flat earth compacted at the centre and surrounded by misty air and clearer ether above and below. Contemporaries were scandalized by Anaxagoras' claim that sun, moon and stars were nothing but incandescent stones caught up in the revolving ether.

Later fifth-century physicists - notably Archelaus and Diogenes of Apollonia - developed revised versions of Anaxagoras' system, but abandoned his dualism. His conception of mind excited but disappointed Socrates, and exercised a profound influence on Plato's cosmology and Aristotle's psychology. Aristotle was also fascinated by the complexities of the remarkable theory of 'everything in everything'. Anaxagoras' philosophy was never subsequently revived, but he was remembered as the mentor of the statesman Pericles and the poet Euripides. His reputation as a rationalist critic of religion persisted throughout antiquity.

1 Life and work

Anaxagoras, son of Hegesibulus, was a native of Clazomenae (a coastal town in what is now Turkey). He was the first major philosopher to spend time in Athens, where he was an associate of the statesman Pericles. The evidence for his residence there is confused although quite extensive. He is said to have arrived in Athens in the archonship of Callias (456/5 BC). Knowledge of his ideas probably preceded his arrival, to judge from echoes of his explanation of physical phenomena in Aeschylus' tragedies *Supplices* (*c.*463 BC) and *Eumenides* (458 BC). He was believed to have predicted the fall of a large meteorite in Thrace that is dated *c.*467 BC. Anaxagoras' stay in Athens may have lasted for about twenty years (so Mansfeld 1979-80), until his prosecution and trial on a charge of impiety (dated by Mansfeld to 437/6 BC). He died in Lampsacus on the Hellespont, where the funeral honours accorded to him suggest a high reputation.

Diogenes Laertius (I 16) counts Anaxagoras among those philosophers who wrote only one work. But some of his views, for example those on perspective and geometry, may have been the subjects of separate memoranda (A38-40). The surviving fragments all appear to come from a general work on the nature and origins of the physical world. The fact of their survival makes for a more direct impression of Anaxagoras' style of thought and his major theses than is possible in the case of Presocratics such as Anaximenes. However, there remain considerable problems of interpretation. One reason is that Anaxagoras' prose, while capable of striking and elevated effect, is too dense and imprecise to allow determinate formulation of the subtle and ingenious distinctions which scholarship has seen as fundamental to his system. Another is that the Aristotelian commentator Simplicius, who is responsible for preserving most of the fragments, quotes them not in the course of a straightforward exposition of Anaxagoras' philosophy, but in order to illustrate various points in either Aristotle's account of Anaxagorean ontology or his own Neoplatonist interpretation of the cosmogony. So while possession of actual extracts from Anaxagoras' book is a huge bonus, their function in his argumentative or expository strategy often eludes us.

2 The original condition

The first few sentences of Anaxagoras' book ran as follows:

> All things were together, unlimited both in quantity and in smallness. For the small was indeed unlimited. And with all things being together nothing was manifest on account of smallness. For air and ether contained all things, both being unlimited. For these are the greatest present among the totality of things, both in quantity and in magnitude.

(fr. 1)

Much in this speculative story is mysterious. What range or category of items count as 'things' (*chrēmata*)? How is their 'smallness' to be understood? In what sense did air and ether 'contain' everything? What is the difference intended between their greatness in quantity and their greatness in magnitude? It was a characteristic trait of Presocratic writing first to grab the reader's attention with a memorable opening, and then to whet the appetite with a pregnant development whose full meaning and justification would emerge only gradually. Anaxagoras provides a copybook example of the technique.

Only one other fragment describes the original condition:

> Before these things were separated off, when all things were together, not even any colour was manifest. For the mingling together of all things prevented it - of the wet and the dry and the hot and the cold and the bright and the dark, much earth being present there also and seeds unlimited in quantity, in no way like each other. For of the others no one is at all like another. Since this is so, one must suppose that all things were present in the totality.

(fr. 4, second part)

Putting the two passages together, we get the following lists of ingredients of the mixture: (1) air and ether (the predominant constituents), a lot of earth and seeds unlimited in number; (2) the wet and the dry, the hot and the cold, and so on. The relation of lists (1) and (2) is obscure. It may be that the wet and the dry and so on, simply *are* earth, air, ether, and so on, under another description, one particularly important for understanding the process of separation which initiates cosmogony. There is also the question of which form of description Anaxagoras conceived as the more fundamental for ontology.

The major items listed in (1) are presumably the actual quantities of the material stuffs which dominate the universe as it is now. The identity and ontological status of Anaxagoras' seeds has been much debated. The final sentences of fragment 4 suggest that he is once again extrapolating from what the universe at present contains to what it must be supposed to have contained originally. A best guess is that from the irreducible present variety of an unlimited number of living species (plants as well as animals), he infers unlimited numbers of biological seeds in the original condition. These he may have conceived as small particles - that would make sense of the explanation in fragment 1 that nothing was manifest 'on account of smallness'. So interpreted, Anaxagoras is making the general assumption that instances of whatever clearly differentiated species of living things now exist must also have existed at least in seminal form before cosmogony.

The thesis in fragment 1 - that there is no lower limit on how small something could be in the original condition - has as its counterpart the thesis that there is no upper limit on how large things can be. From fragment 2, which speaks of what surrounds our differentiated universe as unlimited in quantity, we can infer that the totality was and is infinite in size. Anaxagoras appears to argue the point about largeness by parity of reasoning:

> For of the small there is no least but always a lesser (for what is cannot not be) - but also there is always a larger than the large. And it is equal in quantity to the small. But with respect to itself each thing is both large and small.

(fr. 3)

Readers of fragment 3 have often been reminded of Zeno's paradoxes (see Zeno of Elea §§4-6), although it is not known which philosopher wrote first. Anaxagoras evidently differs from Zeno in finding the notion of infinite divisibility basically unproblematic. The similarity lies not just in the denial that there is a least, but in the metaphysical status of that claim, sustained as it is not by physical considerations but by reflection on our

conceptions of magnitude, and here particularly the logic of 'large' and 'small'.

3 In everything a portion of everything

The evidence suggests that Anaxagoras next introduced the theme of the separation of the ingredients of the primordial mixture. It looks as though this section of the book emphasized not the process itself nor its outcome in cosmic order, but a very general feature of reality as it is in its separated state: in everything there is a portion of everything. Despite separation, there is a sense in which mixture remains the general condition of things.

This paradoxical theory dominates the presentation of Anaxagoras' views in Aristotle and in what we can recover of other ancient writers who report them. Anaxagoras apparently appealed to several different lines of argument, perhaps designated 'signs' (*sēmeia*) or 'evidences' (*tekmēria*), in recommending the theory to his readers. For one of these we have his own statement (fr. 6). Others are mentioned by Aristotle and the subsequent tradition; here only one sentence attributable to Anaxagoras himself survives (fr. 10).

Most weight was accorded to an argument from growth (for example, A46). Bread and water must contain hair, flesh, nails, bone, and so on. Otherwise the ingestion of food would not make them grow: 'how could hair come from non-hair or flesh from non-flesh?' (fr. 10). As Aristotle puts it, Anaxagoras said that everything is in everything because he saw everything coming to be from everything (*Physics* I 4). A subsidiary argument developed a parallel story about opposites. White has black in it: otherwise the brilliance of snow could not turn into the darkness of water (A97). Anaxagoras made a similar point (details unknown) about heavy and light. Finally, only if there were indivisible minima would it be possible for microscopic pure stuffs to be isolated (fr. 6). But as it is there is no lower limit on smallness (fr. 3), and indeed the small (that is, the latent) must be regarded as no less complex than the large (that is, the manifest):

> And since, too, there are portions equal in number of both the large and the small, in this way too all things will be in everything; nor can they exist separately, but all participate in a portion of everything. Since the least cannot be, none of them could be separated, nor come to be on its own, but as in the beginning so too now all things must be together. And in all things there are many even of those that are separating off, equal in number in both the larger and the smaller.
>
> (fr. 6)

Ancient and modern interpreters alike have been intrigued by the doctrine that there is something of everything in everything. It has accordingly been subject to post-Anaxagorean theoretical refinement and elaboration. Aristotle, followed by the doxographical tradition, inferred from Anaxagoras' arguments for it that the basic building blocks of his ontology were 'homoeomerous', that is, things whose parts were all the same in character as the whole (fr. 6). And he identified these building blocks as the bone, flesh and so on, introduced in the main argument (see, for example, A43, 46). On two occasions he went so far as to claim that air and fire are not themselves elements but composites of 'these and all the other seeds' (see, for example, A43).

These interpretative moves are probably all mistaken. Seeds certainly look to be fundamental items in Anaxagoras' system. But if it is right to suppose that they are conceived in biological terms, as containing what we would call the genetic code for the various living forms which will emerge from them, none like any other, then they cannot be identified with homoeomerous substances such as bone. Indeed, in containing something of everything they will have bone, flesh and so on, as actual or potential ingredients. Whether biological seeds are themselves homoeomerous seems irrelevant to their role in Anaxagoras' system. Again, while Anaxagoras undoubtedly treated bone, flesh and so on, as ingredients also of bread and water, it is unlikely that he regarded them as more fundamental than the animal seeds from which ultimately they emerge. Lastly, to treat air and ether as composites of other more elemental items is to reverse the whole direction of Anaxagoras' explanatory enterprise, which insists on the irreducibility of the variety of the world, and is guided by the maxim: 'The appearances are a sight of what is not manifest' (fr. 21a).

Although Aristotle gave pride of place to homoeomerous stuffs in his account of Anaxagoras' ontology, he also acknowledged the elemental role of opposites. Some modern scholarship has argued that this relative emphasis should be reversed. In the surviving fragments it is certainly the opposites dry and wet, hot and cold, dark and bright and so on, which figure most prominently in Anaxagoras' most general statements about ingredients of

mixtures and separation from mixtures. They also recur as the key factors in his explanation of perception (see §5): we discern the cold by the hot, the drinkable by the brackish, the sweet by the pungent. This evidence has suggested that the claim that there is a portion of everything in everything is to be understood primarily as the thesis that every substance or seed of an organism contains opposite powers of every sort - as fragment 4 puts it: 'forms and colours and savours of every kind'. On this view, Anaxagoras may well have conceived such powers as more fundamental than air, ether, earth and living species, at least to the extent of holding that such things derive their distinctive characters and causal properties from the particular combinations of opposite powers which are inherent in them as portions.

The word 'portion' (*moira*) looks as if it may be an Anaxagorean technical term. Modern scholarship has argued that it should be interpreted as equivalent to '*pro*portion'. On this view the point of its introduction can be elucidated by confronting an objection to Anaxagoras' thesis that 'each thing is or was most manifestly the things it contains or contained most of' (fr. 12, end). Take the convenient if probably non-Anaxagorean example of gold. If to count as gold a substance has to contain a predominance of gold, even though it has in it something of everything, must not the predominant gold itself contain a predominance of gold, and so *ad infinitum*? This potentially vicious regress succumbs to a distinction between the discrete substances apparent in the world about us, which contain portions of all things, and the unmixed elements that in different proportions make up these discrete substances. Gold is most manifestly gold because it contains a predominant proportion of *pure* gold. So construed, participation (*metechein*) in portions begins to look like an anticipation of Plato's notion of participation in Forms.

Some distinction of this kind is undoubtedly needed if Anaxagoras' doctrine of a portion of everything in everything is to sustain a claim to intelligibility. And the proposal that the expression 'portion' is its vehicle is unquestionably attractive. But it is not without difficulties. Consider for example the beginning of fragment 4: 'These things being so, it is right to think that in all the things that were being put together there were many things of all kinds, and seeds of all things - having forms and colours and savours of every kind'.

This statement is clearly a version of the doctrine. The words 'these things being so' might even be a reference to the *tekmēria* we have just been reviewing. In any event, Anaxagoras is here applying the theory to emerging compounds, and highlighting the omnipresence of seeds within them. But are ingredient seeds pure elemental portions? Not if as argued above they are complex particles, which mention of forms, colours and so on, tends to confirm. Perhaps seeds are ingredients which are themselves made up of elemental portions; or perhaps there is a degree of indeterminacy in the notion of a portion.

4 Mind

At least once in his exposition of the doctrine of 'everything in everything' Anaxagoras announced an exception to the general rule: 'In everything there is a portion of everything except mind, but there are some things in which there is mind too' (fr. 11). Fragment 12 issues a symmetrical disclaimer: just as there are things whose ingredients do not include mind, so mind is something which itself has no ingredients. This is less obviously true, so Anaxagoras argues out the proposition at some length:

> The other things participate in a portion of everything, but mind is unlimited and self-controlling and is not mixed with any thing, but exists alone itself by itself. For if it were not by itself but had been mixed with something else, it would participate in all things, if it had been mixed with any (for in everything there is a portion of everything, as I have said earlier); and the things mixed together with it would be preventing it, so that it would not control any thing in the same way as it actually does being alone by itself. For it is finest of all things and purest; moreover it has all knowledge about everything and harbours greatest strength; moreover all the things that have soul, both the larger and the smaller, all of them mind controls.
>
> (fr.12)

This passage establishes Anaxagoras as a dualist. It is an open question whether in predicating fineness and purity of mind he means to characterize it as incorporeal, or as a uniquely pure body unlike any other material substance - or perhaps simply as something with no specific features of its own other than the capacity for knowledge and control, as seems to be Aristotle's interpretation. Some scholars, noting the hymnic quality of some of the prose in fragment 12, write 'Mind', not 'mind'. But Anaxagoras is talking in general terms, even though the agent of the

cosmogony he is about to describe must be a supreme mind. In seeking to identify a cause adequate to account for an ordered universe, he hits on two properties of mind which qualify it alone for the role: its freedom from the (unspecified) limitations which inhibit all other substances, and its power of controlling movement (presumably other things are subject to the forces exercised upon them by other bodies). No earlier thinker enunciated either the concept of a first cause or its identity as mind with anything approximating Anaxagoras' explicitness.

Having established mind's aptness for the task, Anaxagoras went on to sketch his hypothesis about how the world was formed. He writes as though there *is* only one world, and the ancient doxographers confirm that this was his view, despite some now obscure discussion by him of a separation 'elsewhere' (fr. 4, first part). The account runs as follows:

> And mind controlled the whole rotation, so that it began to rotate at the beginning. And first it began to rotate in a small way, but it is rotating more, and it will rotate more. And the things which were being mixed together and separated off and distinguished, mind knew them all. And whatever things were to be - both those which were and those which are now and those which will be - all these mind ordered, and also this rotation in which now rotate the stars and the sun and the moon and the air and the ether which are being separated off. And the rotation itself caused them to be separated off. And the dense is separated off from the rare, and the hot from the cold, and the clear from the murky, and the dry from the wet.
>
> (fr. 12, continued)

Aristotle echoed the Platonic Socrates' disappointment with this account (A47). Anaxagoras' introduction of mind as principal cause seemed to them to promise a demonstration of how things were ordered for the best. But its actual role in his cosmogony seemed like a mere device to trigger the vortex, which is what does all the real explanatory work. It is indeed quite unclear how mind exercises any 'control' over the process. Should we suppose that, like a design engineer, it could have designed a different mechanistic system from the one it actually produced? Another complaint was that in accounting for particular phenomena Anaxagoras seldom invoked mind, but appealed to 'airs and ethers and waters and many other absurdities' (Plato, *Phaedo* 98c). Post-Newtonian and post-Darwinian readers may think this a point in his favour.

The principal function of the vortex is clearly to 'separate off' (*apokrinein*) concentrations of air and ether, or again of heavier matter; for example, in the form of the earth and the heavenly bodies. But something else mind achieves is 'dispersal' (*diakrinein*):

> And when mind had begun to cause motion, it was separated off from everything moved by it. And whatever mind set in motion, all this was dispersed. But once such things were being moved and dispersed the rotation caused them to be dispersed much more.
>
> (fr. 13)

The idea of dispersal is less clear than that of separation. Perhaps it is the process whereby 'seeds' are disentangled from one another, in contrast with what is necessary for stuffs like air and ether. 'Mixture' (*symmisgesthai*), the other main process referred to in fragment 12 and elsewhere, is not attributed to mind's activity. Doubtless it is the mechanism by which humans and animals and plants are 'compounded' (fr. 4): fragment 17 asserts that what the Greeks call coming into being is really mixture. The extant fragments say nothing about how mixture works. Do seeds somehow control a process whereby portions of the appropriate stuffs are absorbed from the earth and elsewhere into the growing organism? On this view they would exercise one of the key functions carried out in Empedocles' system by Love, with mind playing a role analogous to his Strife (see Empedocles §5).

5 Conclusion

Anaxagoras evidently included in his book discussion of the full range of particular physical problems that had become mandatory topics for a treatise on nature. These include details of the formation of the earth and the heavenly bodies, accounts of meteorological phenomena, a treatment of the origins of animal life and an exploration of the fundamentals of human physiology and psychology. By comparison with his ontology, Anaxagoras' views on these issues are mostly less original. None the less some specific points deserve a mention.

Anaxagoras knows, for example, that the moon has plains and ravines, borrows its light from the sun and is eclipsed when screened by the earth. His explanation of the rising of the Nile in summer, as due to snows melting

to the south, is eminently reasonable, albeit probably wholly speculative (A42). His most interesting remark about humans is the claim that 'it is the possession of hands which makes them the wisest of living things' (A102). Theophrastus tells us at some length about Anaxagoras' theory of sensation. The main idea is that like is not affected by like: something that is as warm or cold as us does not warm or cool us. We are aware of warmth because we are cold, or rather because the warmth in us is deficient relative to the cold (A92).

Anaxagoras' physical system, like the atomism of Leucippus and Democritus, is developed within a framework that is at once Eleatic and Ionian. But he offers an opposite approach to most of the problems he attacks. He is what would nowadays be described as a mind-matter dualist: they are materialists. In place of discrete atoms in eternal motion through a void, he thinks of matter as intrinsically inert,and constituting an infinitely divisible continuum. And the powers inherent in matter are without effect unless triggered by the purposive decision of mind.

Anaxarchus (*c*.380-*c*.330 BC)

The Greek philosopher Anaxarchus of Abdera was a friend of Alexander the Great, teacher and friend of Pyrrho, and heroic victim of a tyrant. More a court philosopher than a school one, and an ambiguous personality, he seems to have mixed a highly original philosophical cocktail: a primarily ethical, cynically inclined outlook, combined with certain elements of Democritean ethics, epistemology and physics. His only attested work was a treatise On Kingship, his dominant interest perhaps being the theory and practice of relations between intellectual and ruler.

Little is known of Anaxarchus' early life before meeting Alexander. His background lay in the writings of Democritus, like him a native of Abdera, and in the teaching of the obscure Diogenes of Smyrna, a pupil of the sceptical Democritean, Metrodorus of Chios. The ancient writers of philosophical 'successions' placed Anaxarchus in a chain running from the Eleatics and Democritus to Pyrrho, to give Pyrrhonian scepticism a distinguished ancestry. That chain underlies the life of Anaxarchus recounted by Diogenes Laertius (Book IX).

After somehow joining Alexander's inner circle, Anaxarchus followed him on his eastern campaign, and brought Pyrrho with him. Alexander's biographers frequently cite his witticisms and sayings. He comes over mainly as caustic and arrogant - strongly enough placed to have no fear of making enemies, notably Nicocreon, who later took cruel vengeance on him, and Callisthenes, a relative of Aristotle who was eventually put to death by Alexander. This feud with Callisthenes explains the striking hostility of the Peripatetic tradition towards Anaxarchus, described in it as a voluptuary and an odious flatterer of Alexander (A4, A9). His attitude towards the king seems actually to have been the much more complex one of a sort of philosopher-jester. Boldly exercising his 'freedom of speech' (*parrhēsia*) in sometimes risky jokes, he pretends to encourage Alexander's ambitions of conquering the world, of being hailed in the oriental fashion (*proskynēsis*), or of being acknowledged as a god, using doubled-edged arguments which are implicitly derisive. He mocks the tears which Alexander sheds after killing his friend Clitus, with the put-down remark that 'everything done by those in power is just and lawful'. In these different situations, Anaxarchus 'skilfully mixes sweetness and acidity' (A7), and perhaps shows how we may interpret his ambition of 'bringing people back to their senses in the easiest way' (A1). The two preserved fragments of his treatise *On Kingship* happen to bear on the two areas in which the relations between the intellectual and power can pose thorny problems: the spoken word (fr. 1) and money (fr. 2). In these areas, one should show the kind of wisdom which Anaxarchus (fr. 1) defines as 'knowledge of the measures of *kairos* [the right moment]'.

The tales of Anaxarchus' death, however, confirm that he was not merely an opportunistic courtier. Having accidentally fallen into the hands of his old enemy, the Cypriot tyrant Nicocreon, he was thrown into a mortar and crushed with iron pestles. Retaining his calm and his irony even under torture, he said: 'Crush, crush Anaxarchus' container; Anaxarchus himself you will not crush.' This heroic death, like Socrates', long remained a paradigm of philosophical martyrdom.

According to Plutarch, Anaxarchus 'from the beginning beat an original path in philosophy'. This frustratingly brief statement is hard to flesh out. On the basis of his nickname, 'the happiness man' (*eudaimonikos*), earned by 'his impassivity and his even temper in life' (A1), late sources (A14) implausibly make him the founder of a 'happiness school'. In reality, 'impassivity' was a Cynic trait and 'even temper' a Democritean one. Both passed, in time, into Pyrrhonism (see Pyrrhonism §6).

According to Sextus Empiricus (A16), many ranked Anaxarchus with the philosophers who 'abolished the criterion of truth'. However, it is unlikely that he maintained a very sophisticated scepticism. In one of his preserved fragments (fr. 1) he presents himself implicitly as a 'polymath', someone of multiple knowledge, and one anecdote (A11) has him, in conversation with Alexander, preaching the Democritean doctrine of infinite worlds. If there is any scepticism in him, it is rather a practical, lived scepticism, albeit influenced by Democritus' famous assault on the reality of the sensible world (see Democritus §3). It is expressed in the ironic yet despairing saying attributed to Anaxarchus, as also to the Cynic Monimus: 'They compared existing things to a stage-painting (*skēnographia*), and thought that they resembled the images seen in dreaming or insanity' (A16).

Just as an old world was vanishing and a new one being born amidst the din, the blood and the fury, Anaxarchus knew how to give striking expression to that feeling of unreality which accompanies such turnings in the tide of history. In that troubled age, which lost its bearings without finding new ones, Anaxarchus remained happy both in pleasure and under torture. He won and kept the friendship of people like Alexander and Pyrrho, and aroused the lasting hatred and resentment of someone like Nicocreon. No doubt he was, as Timon suggests (A10), an ambiguous man. Certainly he was no ordinary man.

Anaximander (*c*.610-after 546 BC)

The Greek philosopher Anaximander of Miletus followed Thales in his philosophical and scientific interests. He wrote a book, of which one fragment survives, and is the first Presocratic philosopher about whom we have enough information to reconstruct his theories in any detail. He was principally concerned with the origin, structure and workings of the world, and attempted to account for them consistently, through a small number of principles and mechanisms. Like other thinkers of his tradition, he gave the Olympian gods no role in creating the world or controlling events. Instead, he held that the world originated from a vast, eternal, moving material of no definite nature, which he called apeiron *('boundless' or 'unlimited'). From this, through obscure processes including one called 'separation off', arose the world as we know it. Anaximander described the* kosmos *(world) and stated the distances of the celestial bodies from the earth. He accounted for the origin of animal life and explained how humans first emerged. He pictured the world as a battleground in which opposite natures, such as hot and cold, constantly encroach upon one another, and described this process as taking place with order and regularity.*

1 Life and work

Very little is known of Anaximander's life. His dates (*c*.610 BC-shortly after 546 BC) are not certain, but make him a generation younger than Thales, whose pupil, successor and associate he is variously called. Like Thales he was a Milesian. He is said to have travelled to Sparta, where he predicted an earthquake and set up a *gnōmōn* (a Babylonian invention for marking the length of the sun's shadow, which he is credited with discovering) on the sundials there to mark solstices, equinoxes and the hours of the day. He is also said to have led a Milesian colony to Apollonia on the Black Sea and, it is reported, made the first map and the first 'sphere' or celestial globe. He wrote at least one work, known as *On Nature* (the title the Alexandrian scholars later gave to the works of most of the Presocratics; it is not Anaximander's title) in which he presented his views on the *kosmos*. (We hear of several other works - *Circuit of the Earth*, *On the Fixed Stars*, *Celestial Globe* - but these are dubious.)

As with other reported discoveries of the Presocratics, this evidence demands cautious treatment. The map is possible, although it will have been extremely crude and founded more on principles of symmetry than on measurement. (See Herodotus, IV 36 for a critical assessment of early maps.) And, since Anaximander had views about the size and shape of the *kosmos*, he may have constructed a model of it. If he foretold an earthquake however, it was just a lucky guess. Alternatively, later authors could have invented the prediction to give Anaximander something comparable to Thales' prediction of an eclipse. The report about the *gnōmōn* is usually accepted as likely, as it agrees with Anaximander's undoubted interest in astronomy.

2 The *apeiron*

Anaximander is best known for his physical theory, which described the original material of the universe as *apeiron*: 'boundless' or 'unlimited' or, possibly, 'indefinite' (the word later acquired the more technical meaning of 'infinite'). What this material is like, how it is related to the *kosmos* around us, and how Anaximander justified his view are basic and controversial issues in understanding his thought. To begin with, what kinds of bounds or limits does it lack? The description 'eternal and unageing' indicates that it is unlimited in time, and since it 'surrounds all the *kosmoi* [plural of *kosmos*]' (Hippolytus, *Refutation* I 6.1, A11) it is vast in extent, and if not infinite, at least unlimited in that there is nothing outside it that limits or determines its size. Furthermore, since it is 'neither water nor any other of the things called elements, but some different *apeiron* nature' (Simplicius, *On Aristotle's Physics* 24.16, A9), it is without any definite character or qualities. Hence some argue that it was called unlimited because it lacks internal boundaries or distinctions. It is not clear that the word *apeiron* can bear this meaning, but Anaximander's original substance is nevertheless indefinite in this way too. The original substance was also the originative substance 'out of which came to be all the heavens and the *kosmoi* in them' (*On Aristotle's Physics* 24.17, A9). Anaximander presented a cosmogony in which the *kosmos* arose from the *apeiron* in a series of developmental stages. Thus, the *apeiron* is the ancestor of all that exists.

Aristotle and his followers present another view: the *apeiron* is the element or substance out of which everything is composed, an Aristotelian material cause (see Aristotle §9). Thus, everything is made of *apeiron* in the way coal and diamonds are made of carbon. Aristotle occasionally identifies the *apeiron* instead as a mixture of the four

elements that he recognized, and also as a substance intermediate between fire and air or between air and water. These ’mixture’ and ’intermediate’ interpretations must be discarded as guesswork, and the idea that it is a material cause must be rejected as Aristotelian invention too, since it does not fit the rest of the evidence on the role of the *apeiron* in Anaximander’s system.

Not only is the *apeiron* our ancestor, it is divine. Anything that is ’eternal and ageless’ and also ’in motion’ (*On Aristotle’s Physics* 24.13, A9), which is ’immortal and imperishable’ and which ’surrounds all and steers all’ counts, for the Greeks, as a divine being (Aristotle, *Physics* 203b11-13, A15). It is disputed how many of these words were Anaximander’s, but the ideas they represent seem authentic. Just what ‘divine’ means in this context is of critical importance. In some sense the *apeiron* is the Creator, but it is remote from the Greeks’ anthropomorphic conception of the Olympian gods, who demand worship, intervene in human affairs and are motivated by pride, anger and favouritism. Like Xenophanes’ god, the *apeiron* is ’not similar to mortals in form or thought’ (Xenophanes, fr. 23) (see Xenophanes §3). Unlike Xenophanes’ god, the *apeiron* lacks perceptive and cognitive capacities (Xenophanes, fr. 24). It seems to have generated the *kosmos* not through any conscious purpose, but somehow as the result of its eternal motion, and the sense in which it ’steers all’ seems to be simply that the way the *kosmos* was generated guarantees that the events that take place in it are governed by an immutable, impersonal, universal law.

Why make the originative substance *apeiron*? The sources attribute two arguments for this thesis to Anaximander (although other ancient arguments are sometimes thought to go back to him as well). The first, which argues that it must be *apeiron* in the sense of ’unlimited in extent’, goes as follows: ’it must be unlimited lest generation fail’ (Aristotle, *Physics* 208a8, A14; Aëtius, I 3.3, A14). Aristotle criticizes the argument on the grounds that ’the destruction of one thing can be the origin of another, the total being limited’. If Anaximander is assumed to be referring either to our own finite *kosmos* or to a succession of finite *kosmoi*, one after another (see §3), it is indeed a bad argument. But if he held that there are an unlimited number of *kosmoi* at the same time, as Aëtius’ text suggests, the argument succeeds as far as the vagueness of the term ’unlimited’ permits.

The second argument concludes that the *apeiron* is qualitatively indefinite: ’The elements have opposite qualities. Air is cold, water wet, fire hot. If any of them were infinite, the others would have been destroyed. Therefore, the elements arise from something different’ (Aristotle, *Physics* 204b26, A16). As it stands, the argument is laden with Aristotelian terminology, and does not prove that the *apeiron* is qualitatively indefinite, only that it is different from the four Aristotelian elements. Its authenticity has been questioned, but it probably has an Anaximandrian kernel, attacking Thales’ conception of water as the basic material of the universe using the argument: ’If everything were made of, or originated from, water, then everything would be wet; but some things are wet, others dry (the opposite of wet); therefore, the basic substance cannot be wet, or dry either’ (see Thales §2). The argument can be generalized to show that the basic substance is unlike any definite substance and lacks all perceptible qualities.

3 The *kosmos*

The point of having an indeterminate originative substance is to allow to arise the wide variety of things (including opposites) that we find in the world around us. Anaximander’s account of the origin of the *kosmos* confirms this interpretation. From the eternal *apeiron*, ’something capable of producing hot and cold’ separated off. This gave rise to hot in the form of a sphere of flame, which surrounded cold, in the form of dark mist, ’like bark around a tree’. The sphere of flame subsequently broke up to form the sun, moon and stars, while the mist afterwards became earth and sea.

This is not a creation myth where a divinity creates or acts on matter separate from itself, but an essentially biological account of generation or development which takes place because of the nature of the material that generates the *kosmos*. On this account, the *apeiron* plays no active role after the obscure initial process, which is described as ’separation off’. Once started, the world goes its own way. Anaximander speaks of other events that involve ’separation off’, and to judge by them the process does not require purposeful activity or the intervention of an agent. It need not involve any more than some part or amount of an existing thing coming together and being isolated from the rest in such a way as to take on a distinct identity from the rest and behave differently.

Several details of Anaximander’s astronomy deserve mention. The heavenly bodies are rings of fire enclosed in

tubes of mist pierced with holes for the fire to shine through. Eclipses and the phases of the moon are caused when the holes are blocked. The sun is the same size as the earth. The sun is farthest from the earth, followed by the moon, with the stars nearest. The earth is a cylinder, ’like a column drum’, whose depth is one-third its breadth. Anaximander gave the distances of the heavenly bodies from the earth, and although the evidence is untidy, most scholars agree that he made the distances of the stars, moon and sun respectively nine, eighteen and twenty-seven times the size (?breadth) of the earth. The earth is in the centre of the *kosmos* and remains there without support.

The absence of the *apeiron* and of the Olympian gods is notable, as is the boldness of Anaximander’s ideas. His figures for the size of the *kosmos* are fanciful, but his conviction that the *kosmos* is symmetrical and based on proportion, and the tenet that important facts about the physical world can be expressed numerically, are a priori principles worthy of a scientist. The odd picture of the celestial bodies as rings rather than points of fire is doubtless the answer to the question where all the fire in the cosmogonic sphere of flame went to. Anaximander may (although this is speculation) have located the stars nearest the earth through the following reasoning: their light is dimmest and they give the least heat because the fire they are made of is less pure than that of the sun; celestial fire is purer the less affected it is - and therefore the more remote it is - from the cool region of the earth; therefore the stars are nearest the earth and the sun farthest.

Anaximander believed the earth stays in the centre without support ’because it stays put on account of its similar distance from all things’ (Hippolytus, *Refutation* I 6.3, A11). Also, ’it is no more appropriate for what is located in the middle and similarly related to the extremes to move up, down or sideways; and it is impossible to move in opposite directions simultaneously; and so by necessity it is at rest’ (Aristotle, *On the Heaven* 295b12, A26). Although not all scholars accept this reasoning as Anaximander’s, there is no reason why he could not have said something similar to the former of these reports. Aristotle could then have supplied the missing steps in the argument, which amounts to the first recorded use of the Principle of Sufficient Reason. The picture of the earth hanging free in the middle of the *kosmos* contrasts with Greek mythology and with Thales’ belief that the earth rests on water, as well as with that of Anaximander’s successor, Anaximenes (§2), who believed that it is supported by a column of air. It is based on our experience that the earth does not seem to move, along with Anaximander’s theory of the origin and structure of the *kosmos*, which leaves no room for a prop.

Like other Presocratics, Anaximander gave accounts of meteorological phenomena agreeing with his cosmogony and cosmology. Fire and dark mist are again prominent, as is ’separation off’, this time caused by the sun’s heat, which accounts for wind, clouds and (if ’separation off’ of dry from wet involves ’exhalation’ and ’drying’) rain, as well as other effects, including the eventual desiccation of the earth. Wind in turn is the cause of thunder, lightning, thunderbolts, waterspouts and hurricanes.

Anaximander took the same approach to the problem of the origin of life. ’The first animals were born in moisture, surrounded by thorny barks, and when they grew older they went forth onto drier regions, and when the bark broke off they lived a different life for a brief time’ (Aëtius, V 19.4, A30). Animals have a similar origin to the *kosmos* (the repetition of the image of a tree’s bark is hardly coincidental) and one linked to the progressive drying out of the sea. Regarding the beginning of human life, ’from water and earth that had been heated arose fishes or animals very similar to fishes; humans grew in these and remained inside until puberty; then at last they burst and men and women came forth already able to feed themselves’ (Censorinus, 4.7, A30). Although this is not an anticipation of the theory of evolution (as some have thought), it gives a typically bold solution to the problem of how the first generation of humans could have survived until they could take care of themselves and reproduce.

Two other issues are whether our *kosmos* will last forever and whether it is unique. Regarding the first, Anaximander’s fragment can be taken to imply that the inconclusive war between opposites will continue forever, so that our *kosmos* has a beginning but no end. However, there is no trace of such a view in the sources and, since later Greek philosophers strongly rejected such asymmetries, the silence indicates that Anaximander did not maintain the view explicitly. On the other hand, since it is unclear how the *kosmos* would come to an end, it is likely that he did not discuss the matter in any detail.

Regarding the second issue, most scholars hold either that Anaximander considered the *kosmos* unique or that he posited an infinite succession of *kosmoi*, one after another. However, several sources mention a limitless number of coexistent *kosmoi*. The evidence is not unanimous and can be taken in different ways, but it would arguably be consistent with Anaximander’s system and with his use of the Principle of Sufficient Reason for him to maintain

that the process which formed our world need not occur only at one time or in one place.

4 Anaximander's fragment

Aside from a few words in the doxography which may be original, we possess one fragment less than a sentence long. Even here it is disputed which words are original and which are paraphrase. The passage reads as follows (the material in italics is widely thought to be genuine): 'Things that are perish into the things from which they arise, *according to necessity. For they pay penalty and retribution to one another for their injustice, according to the ordinance of time*'. Simplicius, who quotes the fragment in his text *On Aristotle's Physics* (24.18, fr.1), says it describes the relation between things in the world and the *apeiron*, but on grammatical as well as systematic grounds most scholars think it gives Anaximander's view of events in the world without reference to the *apeiron*. Day and night, summer and winter, and many other phenomena involve the regular alternation of the preponderance of one opposite over another. The opposites here are hot and cold, wet and dry, light and dark, etc, conceived not as properties of substances but as 'powers' (*dynameis*) which are capable of affecting things and are embodied or contained in the substances characterized by them. The *kosmos*, then, is a battleground in a war between opposites, a dynamic equilibrium in which one invades the other's territory but is repulsed and loses some of its own ground in turn. On this interpretation the fragment accords with the view favoured above, that the *apeiron* plays no part in the ongoing functioning of the *kosmos*; it was needed at the beginning of the *kosmos*, but, because of the way the *kosmos* was generated, things go on without further need of it.

Noteworthy is the legal language, which Anaximander probably meant literally, since he and other Presocratics did not contemplate any radical difference between humans and the rest of the *kosmos* that would make certain concepts and vocabulary appropriate to one but not the other. Also significant is the idea that events in the world are governed by necessity and occur in an inevitable sequence - a revision of traditional beliefs about the powers of the Olympian gods.

Anaximander brilliantly extended Thales' approach to the understanding of the world to explain a wide range of phenomena. He saw the *kosmos* as a place of order, balance and symmetry; also of change and conflict, subordinated to larger-scale patterns of stability. The testimonia reveal him as a pioneer in several fields of science, but at least as important is his unprecedented use of abstract and general considerations in his reasoning, together with his observations of the world, to articulate a largely unified and coherent understanding of it. His most striking theories were too bold for his immediate successors, but his goal of constructing an intelligible account of the history and workings of the *kosmos* remained as his legacy to philosophy and science.

Anaximenes (6th century BC)

The Greek philosopher Anaximenes of Miletus followed Anaximander in his philosophical and scientific interests. Only a few words survive from his book, but there is enough other information to give us a picture of his most important theories. Like the other early Presocratic philosophers he was interested in the origin, structure and composition of the universe, as well as the principles on which it operates. Anaximenes held that the primary substance - both the source of everything else and the material out of which it is made - is air. When rarefied and condensed it becomes other materials, such as fire, water and earth. The primordial air is infinite in extent and without beginning or end. It is in motion and divine. Air generated the universe through its motion, and continues to govern it. The human soul is composed of air and it is likely that Anaximenes believed the entire kosmos *(world) to be alive, with air functioning as its soul. Like other Presocratics, he proposed theories of the nature of the heavenly bodies and their motions, and of meteorological and other natural phenomena.*

1 Air, the cosmic principle

Practically nothing is known of Anaximenes' life. He is called the associate and the pupil of Anaximander, on which inadequate basis the ancient testimony makes him a generation younger than his teacher. He wrote a book in 'plain and simple Ionian dialect', but like the works of the other Presocratics it has not survived, although it must be the source of the few words the sources assign to Anaximenes.

From Aristotle onwards, Thales, Anaximander and Anaximenes have been accepted as working within a single tradition: they tackled a single set of problems and used the same methods to solve them (see Thales; Anaximander). These three Milesian philosophers initiated the Greek philosophical tradition by investigating the origin, structure and workings of the *kosmos* by rational means, abandoning traditional religious and mythological accounts in favour of observation and reason. It is commonly accepted that Anaximander designed important elements of his system to avoid objections he found to Thales' views, and that Anaximenes returned to a theory closer to Thales' but one that both avoided Anaximander's objections and did not suffer from faults that can be found in Anaximander's theory. On this standard view, Milesian philosophy made progress from philosopher to philosopher, and the progress was due to the use of rational criticism. While this line of interpretation is plausible for certain central elements in the thought of these three thinkers, most obviously for their views on the nature of the basic substance, it does not give an adequate picture of other facets of their wide-ranging theories. Also, it is an interpretative construct, not one based on original texts. The sources tell to some extent what the three men's theories were, but not why they adopted them.

Where Anaximander postulated a substance of indeterminate nature, unlike anything found in the world around us, as the ultimate source of the diversity of materials found in the *kosmos*, Anaximenes returned to Thales' idea of basing the *kosmos* on a single familiar substance. However, where Thales selected water, Anaximenes chose air. According to the standard interpretation, Anaximander rejected water because there are materials in the world, such as fire, that lack the properties of water (indeed, they have opposite properties), and so could not have arisen from or be made of water. Thus, the basic material must lack all perceptible properties. Anaximenes objected to Anaximander's idea of founding the world on something imperceptible, indefinite and unfamiliar, and returned to a form of material monism, but one not open to Anaximander's objection. Anaximenes held that air in its most 'even' state (as on a clear, dry, windless day when the air seems neither hot nor cold) is imperceptible, but when it becomes more rare or more dense it turns into other kinds of materials. 'When thinned out it becomes fire, and when thickened it becomes wind, then cloud, and when thickened still more, water, then earth, then stones, and the rest come from these' (Theophrastus, quoted by Simplicius, *On Aristotle's Physics* 24.29-31, A5). The mechanisms of rarefaction and condensation engender a more sophisticated monism, according to which fire, for example, is not really different from air, but *is* air in a certain condition, just as ice is not really different from water, but is water in a certain state. 'And the rest come from these' suggests (although this issue is disputed) that air occurs in certain basic forms (the ones listed above), and that other substances, such as wood or wheat, arise through some combination of them. If Anaximenes held this 'proto-chemical' view of the composition of entities, the absence of further discussion in the sources makes it unlikely that he developed the idea through analysis of particular kinds of materials or illustrative examples of other sorts.

Anaximenes was the first reductionist. From the familiar phenomenon that when we exhale through pursed lips our breath feels cold, but when we exhale with the mouth wide open it feels warm, he concluded generally that compression is the cause of cooling and rarefaction the cause of heating, so that hot and cold depend on rare and dense (Plutarch, *The Principle of Cold* 947F, fr.1). The observation on which this conclusion is based is hardly a scientific experiment (although it has sometimes been called the first one), but there are many elements of scientific reasoning in the way Anaximenes begins from a repeatable result and generalizes it to an explanatory principle related to a larger theory, and also in the way he accounts for one range of phenomena in terms of another which he considers more basic. The fact that his conclusion is exactly wrong is less important than these other considerations.

Density and rarity are quantitative concepts - more or less of something in a given volume - while hot and cold are qualities. Anaximenes is thus credited with being the first to subscribe to the scientific objective (also pursued shortly afterwards by the Pythagoreans) of reducing qualities to quantities (see Pythagoreanism §2).This is probably a misinterpretation however. For although we define density in quantitative terms, Anaximenes need not have seen it this way. There is no reason to suppose he thought there were fixed proportions governing the changes of air, so that, for example, so much fire contains the same amount of air as so much water. He held that ice is denser than water (Aëtius, III 4.1, fr. 3), but is there more water in a cup full of ice than in a cup full of water? (Indeed, water at 4° Celsius is denser than ice, but Anaximenes was unaware of this fact.) The evidence suggests that he did not take a quantitative view of these matters, but considered air, clouds, rain, etc. as more or less dense, as if rarity and density were qualities apparent to the senses and not dependent on measurement.

Like Anaximander’s originative substance, Anaximenes’ air is described as eternally in motion and also as *apeiron* (’boundless’ or ’unlimited’;the word later meant ’infinite’, but in Anaximenes’ time did not yet have any precise mathematical sense), meaning that it has no limits in space or time. Not that all air is in motion all the time, since air in motion is wind, and wind is denser than air in its most ’even’ state. Thus, air is mobile, and at any given time, much of it is in motion. Moving through its own nature, it is alive, and being everlasting, it is divine. (These were also Anaximander’s reasons for regarding his basic substance as divine.)

2 The *kosmos*

Like other Presocratic philosophers, Anaximenes proposed a cosmogony and a cosmology that fitted his basic principles. Little information on these topics survives and some of it seems to be inconsistent. Our *kosmos* originated out of the self-moving air which became so dense in one region that it was ’felted’ (the word may be Anaximenes’ own), or compressed, to form earth. The earth is a flat ’table-like’ disc and so rides on the air beneath it like a leaf. There are different accounts of the heavenly bodies. According to the most plausible one, as the earth grew more dense there arose from it moisture that became rarefied and turned into fire; the fire went aloft and became the heavenly bodies. The stars do not give heat because of their great distance from the earth. Like the earth, these fiery bodies stay aloft because of their flatness. There are also earthen bodies in the heavens, which may be posited to account for eclipses. The heavenly bodies do not move underneath the earth, but around it, as when a felt cap (shaped like a yarmulke) is turned about its centre while on someone’s head. The geometry of this model is difficult to work out, but the simple and homespun analogy is characteristic of Anaximenes.

Also typical of the Presocratics is Anaximenes’ interest in meteorological phenomena. Wind, clouds, rain, etc. are condensed air. When rain freezes as it falls it becomes hail, and it becomes snow when ’something of the nature of breath’ is combined with the moisture. Anaximenes explains the rainbow, traditionally the goddess Iris, as the effect of the sun’s rays striking condensed air, and offers an account of why it has different colours. Lightning and earthquakes (the work of Zeus and Poseidon) likewise receive naturalistic explanations.

To our knowledge, Anaximenes did not discuss the origin and conditions of animal life, although this may be due to the meagre evidence we possess about his ideas. Certainly these issues were prominent with Anaximander. Anaximenes did declare that the gods are made of air, thus decisively subordinating the Olympian religion to physics. A purported quotation bears on the nature of the soul, a topic which as far as we know Anaximander did not discuss: ’As our soul, being air, holds us together and controls us, also breath and air surrounds the whole *kosmos*’ (fr. 2). This fascinating statement (some of whose language is almost certainly a rewording of the original) starts from the traditional, non-philosophical idea that the soul, or principle of life, is the breath. The soul maintains us in existence (’holds us together’) as living beings and governs our activities (’controls’), although

how it governs and what activities it controls are unclear. (So, for example, we cannot tell whether the soul has cognitive or moral aspects, or whether creatures other than humans possess souls.) The point of the analogy must be that 'breath and air' has (note the singular verb, as in the Greek of the fragment; 'breath and air' is a single idea, perhaps equivalent to 'breath in the form of air') similar functions in the *kosmos*. As it stands, the fragment is not an argument. It is an analogy, which despite its lack of probative force may reveal one of the insights that led Anaximenes to choose air as his basic substance or one that confirmed his choice. The fragment contains the first explicit use of the microcosm-macrocosm analogy in Greek thought. It suggests (although it is not certain that Anaximenes held this view) that air is the soul of the *kosmos*, and therefore that the entire universe is alive. This idea resembles the view attributed to Thales that all things possess soul through their connection with the divine originative substance water. Anaximenes, then, may have found air a more plausible basic substance than water because of the animating functions it possesses according to the traditional conception of the 'breath-soul'.

The last of the great Milesian thinkers, Anaximenes shared with his predecessors an interest in the natural world and the goal of explaining its principal features acceptably to human reason. His cosmology influenced many of the later Presocratics. More conservative than Anaximander in some ways, he devised a theory of the *kosmos* that was intellectually justifiable by the standards of his time and also closer to common experience.

Ancient philosophy

The philosophy of the Greco-Roman world from the sixth century BC to the sixth century AD laid the foundations for all subsequent Western philosophy. Its greatest figures are Socrates (fifth century BC) and Plato and Aristotle (fourth century BC). But the enormously diverse range of further important thinkers who populated the period includes the Presocratics and Sophists of the sixth and fifth centuries BC; the Stoics, Epicureans and sceptics of the Hellenistic age; and the many Aristotelian and (especially) Platonist philosophers who wrote under the Roman Empire, including the great Neoplatonist Plotinus. Ancient philosophy was principally pagan, and was finally eclipsed by Christianity in the sixth century AD, but it was so comprehensively annexed by its conqueror that it came, through Christianity, to dominate medieval and Renaissance philosophy. This eventual symbiosis between ancient philosophy and Christianity may reflect the fact that philosophical creeds in late antiquity fulfilled much the same role as religious movements, with which they shared many of their aims and practices.

Only a small fraction of ancient philosophical writings have come down to us intact. The remainder can be recovered, to a greater or lesser extent, by piecing together fragmentary evidence from sources which refer to them.

1 Main features

'Ancient' philosophy is that of classical antiquity, which not only inaugurated the entire European philosophical tradition but has exercised an unparalleled influence on its style and content. It is conventionally considered to start with Thales in the mid sixth century BC, although the Greeks themselves frequently made Homer (*c*.700 BC) its true originator. Officially it is often regarded as ending in 529 AD, when the Christian emperor Justinian is believed to have banned the teaching of pagan philosophy at Athens. However, this was no abrupt termination, and the work of Platonist philosophers continued for some time in self-imposed exile (see Aristotle commentators; Neoplatonism §1; Simplicius §1).

Down to and including Plato (in the first half of the fourth century BC), philosophy did not develop a significant technical terminology of its own - unlike such contemporary disciplines as mathematics and medicine. It was Plato's pupil Aristotle, and after him the Stoics (see Stoicism), who made truly decisive contributions to the philosophical vocabulary of the ancient world.

Ancient philosophy was above all a product of Greece and the Greek-speaking parts of the Mediterranean, which came to include southern Italy, Sicily, western Asia, and large parts of North Africa, notably Egypt. From the first century BC, a number of Romans became actively engaged in one or other of the Greek philosophical systems, and some of them wrote their own works in Latin (see Lucretius; Cicero; Seneca; Apuleius). But Greek remained the *lingua franca* of philosophy. Although much modern philosophical terminology derives from Latinized versions of Greek technical concepts, most of these stem from the Latin vocabulary of medieval Aristotelianism, not directly from ancient Roman philosophical writers.

2 The sixth and fifth centuries BC

The first phase, occupying most of the sixth and fifth centuries BC, is generally known as Presocratic philosophy (see Presocratic philosophy). Its earliest practitioners (Thales; Anaximander; Anaximenes) came from Miletus, on the west coast of modern Turkey. The dominant concern of the Presocratic thinkers was to explain the origin and regularities of the physical world and the place of the human soul within it (see especially Pythagoreanism; Heraclitus; Anaxagoras; Empedocles; Democritus), although the period also produced such rebels as the Eleatic philosophers (Parmenides; Zeno of Elea; Melissus), whose radical monism sought to undermine the very basis of cosmology by reliance on a priori reasoning.

The label 'Presocratic' acknowledges the traditional view that Socrates (469-399 BC) was the first philosopher to shift the focus away from the natural world to human values. In fact, however, this shift to a large extent coincides with the concerns of his contemporaries the Sophists, who professed to teach the fundamentals of political and social success and consequently were also much concerned with moral issues (see Sophists). But the persona of Socrates became, and has remained ever since, so powerful an icon for the life of moral scrutiny that it is his name that is used to mark this watershed in the history of philosophy. In the century or so following his death, many

schools looked back to him as the living embodiment of philosophy and sought the principles of his life and thought in philosophical theory (see especially Socratic schools).

3 The fourth century BC

Socrates and the Sophists helped to make Athens the philosophical centre of the Greek world, and it was there, in the fourth century, that the two greatest philosophers of antiquity lived and taught, namely Plato and Aristotle. Plato, Socrates' pupil, set up his school the Academy in Athens (see Academy). Plato's published dialogues are literary masterpieces as well as philosophical classics, and develop, albeit unsystematically, a global philosophy which embraces ethics, politics, physics, metaphysics, epistemology, aesthetics and psychology.

The Academy's most eminent alumnus was Aristotle, whose own school the Lyceum came for a time to rival its importance as an educational centre. Aristotle's highly technical but also often provisional and exploratory school treatises may not have been intended for publication; at all events, they did not become widely disseminated and discussed until the late first century BC. The main philosophical treatises (leaving aside his important zoological works) include seminal studies in all the areas covered by Plato, plus logic, a branch of philosophy which Aristotle pioneered. These treatises are, like Plato's, among the leading classics of Western philosophy.

Platonism and Aristotelianism were to become the dominant philosophies of the Western tradition from the second century AD at least until the end of the Renaissance, and the legacy of both remains central to Western philosophy today.

4 Hellenistic philosophy

Down to the late fourth century BC, philosophy was widely seen as a search for universal understanding, so that in the major schools its activities could comfortably include, for example, biological and historical research. In the ensuing era of Hellenistic philosophy, however, a geographical split helped to demarcate philosophy more sharply as a self-contained discipline (see Hellenistic philosophy). Alexandria, with its magnificent library and royal patronage, became the new centre of scientific, literary and historical research, while the philosophical schools at Athens concentrated on those areas which correspond more closely to philosophy as it has since come to be understood. The following features were to characterize philosophy not only in the Hellenistic age but also for the remainder of antiquity.

The three main parts of philosophy were most commonly labelled 'physics' (a primarily speculative discipline, concerned with such concepts as causation, change, god and matter, and virtually devoid of empirical research), 'logic' (which sometimes included epistemology), and 'ethics'. Ethics was agreed to be the ultimate focus of philosophy, which was thus in essence a systematized route to personal virtue (see Aretē) and happiness (see Eudaimonia).There was also a strong spiritual dimension. One's religious beliefs - that is, the way one rationalized and elaborated one's own (normally pagan) beliefs and practices concerning the divine - were themselves an integral part of both physics and ethics, never a mere adjunct of philosophy.

The dominant philosophical creeds of the Hellenistic age (officially 323-31 BC) were Stoicism (founded by Zeno of Citium) and Epicureanism (founded by Epicurus) (see Stoicism; Epicureanism). Scepticism was also a powerful force, largely through the Academy (see Arcesilaus; Carneades), which in this period functioned as a critical rather than a doctrinal school, and also, starting from the last decades of the era, through Pyrrhonism (see Pyrrhonism)

5 The imperial era

The crucial watershed belongs, however, not at the very end of the Hellenistic age (31 BC, when the Roman empire officially begins), but half a century earlier in the 80s BC. Political and military upheavals at Athens drove most of the philosophers out of the city, to cultural havens such as Alexandria and Rome. The philosophical institutions of Athens never fully recovered, so that this decentralization amounted to a permanent redrawing of philosophical map. (The chairs of Platonism, Aristotelianism, Stoicism and Epicureanism which the philosopher-emperor Marcus Aurelius (§1) established at Athens in AD 176 were a significant gesture, but did not fully restore Athens' former philosophical pre-eminence.) Philosophy was no longer, for most of its adherents, a living activity within the Athenian school founded by Plato, Aristotle, Zeno or Epicurus. Instead it was a subject pursued in small study groups led by professional teachers all over the Greco-Roman world. To a large extent, it was felt that the history

of philosophy had now come to an end, and that the job was to seek the correct interpretation of the ‘ancients’ by close study of their texts. One symptom of this feeling is that doxography - the systematic cataloguing of philosophical and scientific opinions (see Doxography) - concentrated largely on the period down to about 80 BC, as did the biographical history of philosophy written *circa* AD 300 by Diogenes Laertius.

Another such symptom is that a huge part of the philosophical activity of late antiquity went into the composition of commentaries on classic philosophical texts. In this final phase of ancient philosophy, conveniently called ‘imperial’ because it more or less coincides with the era of the Roman empire, the Hellenistic creeds were gradually eclipsed by the revival of doctrinal Platonism, based on the close study of Plato’s texts, out of which it developed a massively elaborate metaphysical scheme. Aristotle was usually regarded as an ally by these Platonists, and became therefore himself the focus of many commentaries (see Platonism, Early and Middle; Peripatetics; Neoplatonism; Aristotle Commentators). Despite its formal concern with recovering the wisdom of the ancients, however, this age produced many powerfully original thinkers, of whom the greatest is Plotinus.

6 Schools and movements

The early Pythagoreans constituted the first philosophical group that can be called even approximately a ‘school’. They acquired a reputation for secrecy, as well as for virtually religious devotion to the word of their founder Pythagoras. ‘He himself said it’ (best known in its Latin form ‘*ipse dixit*’) was alleged to be their watchword. In some ways it is more accurate to consider them a sect than a school, and their beliefs and practices were certainly intimately bound up in religious teachings about the soul’s purification.

It is no longer accepted, as it long was, that the Athenian philosophical schools had the status of formal religious institutions for the worship of the muses. Their legal and institutional standing is in fact quite obscure. Both the Academy and the Lyceum were so named after public groves just outside the walls of Athens, in which their public activities were held. The Stoics too got their name from the public portico, or ‘stoa’, in which they met, alongside the Athenian agora. Although these schools undoubtedly also conducted classes and discussions on private premises too, it was their public profile that was crucial to their identity as schools. In the last four centuries BC, prospective philosophy students flocked to Athens from all over the Greek world, and the high public visibility of the schools there was undoubtedly cultivated partly with an eye to recruitment. Only the Epicurean school kept its activities out of the public gaze, in line with Epicurus’ policy of minimal civic involvement.

A school normally started as an informal grouping of philosophers with a shared set of interests and commitments, under the nominal leadership of some individual, but without a strong party line to which all members owed unquestioning allegiance. In the first generation of the Academy, for example, many of Plato’s own leading colleagues dissented from his views on central issues. The same openness is discernible in the first generations of the other schools, even (if to a much lesser extent) the Epicurean. However, after the death of the founder the picture usually changed. His word thereafter became largely beyond challenge, and further progress was presented as the supplementation or reinterpretation of the founder’s pronouncements, rather than as their replacement.

To this extent, the allegiance which in the long term bound a school together usually depended on a virtually religious reverence for the movement’s foundational texts, which provided the framework within which its discussions were conducted. The resemblance to the structure of religious sects is no accident. In later antiquity, philosophical and religious movements constituted in effect a single cultural phenomenon, and competed for the same spiritual and intellectual high ground. This includes Christianity, which became a serious rival to pagan philosophy (primarily Platonism) from the third century onwards, and eventually triumphed over it. In seeking to understand such spiritual movements of late antiquity as Hermetism, Gnosticism, Neo-Pythagoreanism, Cynicism and even Neoplatonism itself, and their concern with such values as asceticism, self-purificaton and self-divinization, it is inappropriate to insist on a sharp division between philosophy and religion (see Hermetism; Gnosticism; Neo-Pythagoreanism; Cynics §4; Neoplatonism).

‘Ancient philosophy’ is traditionally understood as pagan and distinguished from the Christian Patristic philosophy of late antiquity (see Patristic philosophy). But it was possible to put pagan philosophy at the service of Judaism (see Philo of Alexandria), or Christianity (see for example Clement of Alexandria; Origen; Augustine; Boethius; Philoponus), and it was indeed largely in this latter capacity that the major systems of ancient philosophy eventually became incorporated into medieval philosophy and Renaissance philosophy, which they proceeded to

dominate (see Medieval philosophy; Renaissance philosophy).

This extensive overlap between philosophy and religion also reflects to some extent the pervasive influence of philosophy on the entire culture of the ancient world. Rarely regarded as a detached academic discipline, philosophy frequently carried high political prestige, and its modes of discourse came to infect disciplines as diverse as medicine, rhetoric, astrology, history, grammar and law. The work of two of the greatest scientists of the ancient world, the doctor Galen and the astronomer Ptolemy, was deeply indebted to their respective philosophical backgrounds.

7 Survival

A very substantial body of works by ancient philosophical writers has survived in manuscript. These are somewhat weighted towards those philosophers - above all Plato, Aristotle and the Neoplatonists - who were of most immediate interest to the Christian culture which preserved them throughout the Middle Ages, mainly in the monasteries, where manuscripts were assiduously copied and stored. Some further ancient philosophical writings have been recovered through translations into Arabic and other languages, or on excavated scraps of papyrus. The task of reconstituting the original texts of these works has been a major preoccupation of modern scholarship.

For the vast majority of ancient philosophers, however, our knowledge of them depends on secondary reports of their words and ideas in other writers, of whom some are genuinely interested in recording the history of philosophy, but others bent on discrediting the views they attribute to them. In such cases of secondary attestation, strictly a ‘fragment’ is a verbatim quotation, while indirect reports are called ‘testimonia’. However, this distinction is not always rigidly maintained, and indeed the sources on which we rely rarely operate with any explicit distinction between quotation and paraphrase.

It is a tribute to the philosophical genius of the ancient world that, despite the suppression and distortion which its contributions have suffered over two millennia, they remain central to any modern conspectus of what philosophy is and can be.

Anderson, John (1893-1962)

Arguing against metaphysical 'ultimates' (that is, supposed unconditioned conditions of things), relative truth, appeals to subjective experience, and opposing some of the main tendencies of twentieth-century philosophy, Anderson developed a wide-ranging realist and empiricist philosophy. Highly critical of religion, he was much concerned with other cultural values and advanced views (influential in Australia) on freedom of thought, education, ethics and aesthetics. In ethics, for example, his view is that objective good is not good because it is approved of by certain people; rather those who approve of good (or have other relations to it) do so because it is *good. He carefully distinguished questions about the intrinsic character of good from those about relations social groups may have to it, and goes on to develop an account of intrinsic goods as certain socio-mental activities: enterprise or freedom, objective inquiry, artistic production and appreciation, love and courage.*

Similarly, in aesthetics he distinguishes characteristics of works of art from possible relations between artists, works, appreciators and critics, such as a work's relation to a writer's intentions. In Anderson's view the character and structure of the work itself alone provides an aesthetic criterion for assessing the merit of works of art.

1 Life

John Anderson, Scottish-born philosopher, studied at Glasgow University and lectured there and in Cardiff and Edinburgh before becoming professor of philosophy at Sydney University (1927-58) where he became the leading Australian philosopher of his time, and also a leading controversialist. He was twice censured by the New South Wales Parliament, but was also named as one of the official 200 Australian 'Greats' at the 1988 Bicentenary.

Anderson was influenced by idealist teachers at Glasgow and subsequently in realist ways by William James, G.E. Moore, the New Realists, Kemp Smith, and above all Samuel Alexander. He was also influenced by Heraclitus, Plato, Sorel, Freud, Marx, Vico and Croce, and on wider issues by *The New Age*, a journal of critical thought, during its editorship by A.R. Orage.

A charismatic teacher, Anderson influenced people in a remarkable number of fields, including about thirty who became professional philosophers. These varied in the extent to which they used or agreed with his views. For example, J.A. Passmore, J.L. Mackie and D.M. Armstrong produced well-known work of their own (although Mackie did expand Anderson's views on causes and on hypotheticals), while others, such as A.R. Walker, T.A. Rose, A.J. Anderson and W.V. Doniela, taught and developed views more in the Andersonian tradition. In Britain, Anderson influenced Rush Rhees at Edinburgh and through him his students at Swansea.

Anderson's political orientations, though not his main social theory, changed over the years. At first a communist sympathizer (he mistakenly believed Soviet workers were exhibiting Sorel's 'ethic of the producer'), he was then a Trotskyist between 1933 and 1937, and finally a critical oppositionist concerned to defend pluralist values and 'expose illusions' wherever they are found. In the 1950s he criticized communism and the welfare 'servile state' while tenaciously defending learning and thinking values in education against practicalist and supposedly 'egalitarian' ones.

2 Systematic realism

In Anderson's view there is a certain dogmatism about advancing any philosophic position; nevertheless, support can be offered by showing confusions and inconsistencies in rival views and, as Socrates suggested, by using a hypothetical method to reveal the consequences of your position. Criticism is integral to Anderson's philosophizing; not someone who relies on announcing his 'intuitions', he is one of the leading philosophical 'arguers'.

For brevity, Anderson's position is best stated in terms of the '-isms' he sometimes employed. It is mainly one of realism, objectivism, empiricism and pluralism - interlocking views which may be summed up as 'systematic realism'. Conceptions of relative truth are rejected. There may be much illusory thinking, but attempts to deny the absolute or objective truth of *all* propositions are self-refuting - ' If I say "X is true for me", then I am saying that X's being true for me is an absolute fact' (1962: 294). Anderson likewise rejects, for instance, antirealist claims

that unverified propositions about the past which are unverifiable today are not true or false.

Contrary to idealists and phenomenalists, he holds that the knower and the known have independent status. Opposing views, as in conceptions of ‘dependent existences’ such as ideas, perceptions or sense-data, involve confusions of qualities with relations, and Anderson calls such views ‘relativist’. In a relational situation in which *A* has *r* to *B*, neither *A* nor *r* nor *B* ontologically constitutes any of the others, even when, say, *B* depends on *A* for its origin or continued existence. But in the case of knowledge, relativist confusions are common and are facilitated by cognate accusatives, talk of intentional objects and other ambiguities in the use of such words as ‘perception’ and ‘experience’. Confusions about qualities and relations are also notably rife in ethics and aesthetics (see Realism and antirealism; Relativism).

Anderson’s realism and empiricism (which differs from traditional empiricism) rejects overt and covert rationalistic attempts to set up ‘levels of reality’ in the shape of philosophical ‘ultimates’ such as necessary or divine beings, monism’s one, dualism’s two, or the units of atomistic philosophers (for example, Hume’s perceptions and the simples of Russell and the early Wittgenstein). Arguing against such views - that ‘monism explodes into dualism’, though dualism cannot account for the relations between its two sides, and that atomism fails to reduce complexity to unitary elements - Anderson is an ontological egalitarian: whatever exists is on *the same level of existence* as anything else, and is open to objective, empirical investigation, but there are no underlying ultimate, final or purposive explanations.

In Anderson’s empiricism all knowledge is obtained by observation (and experiment), including introspection, but observation is not indubitable. In any field there is the possibility of discovery and also of error, which arises because of the ‘pluralist complexity’ both of mind and of non-mental things. Mind is a network of varied and conflicting tendencies: because of this and because of Freudian mechanisms we are prone to *mis*observe as well as observe. He sums up his pluralism thus: ‘ There is not only an unlimited multiplicity of things to which the single logic of events applies but anything whatever is infinitely complex so that we can never cover its characters in a single formula or say that we know "all about it"’ (1958: 55) (see Pluralism).

3 Logic, categories

Although the different parts of his position are separably arguable for or against, Anderson places special emphasis on a realist ‘logic of events’, including a realist formal logic. While his broad conception of logic is of the conditions of existence, his formal logic is traditional logic developed and made consistently realist. It deals with AEIO propositional forms, their implications and other logical relations. Just as there is one level of existence, there is one level of discourse and nothing is above or below the proposition whose copula is the ‘is’ of occurrence coupling two terms, one of which, the subject, locates an actual or possible situation, and the other of which, the predicate, characterizes it. Identity, existential and hypothetical statements are analysed in AEIO ways, any term is a ‘real term’ - or presupposed to exist in Strawson’s sense - and more precisely is a ‘complex place-character’ which is the subject of some true propositions and predicate of others. The force of the last point - in regard to the problem of universals - is that there are not separate entities, particular or universal; every situation has both particularity and universality (see Ancient logic §3; Strawson, P.F. §§2-3; Universals §3).

Anderson’s acceptance of subject-predicate logic thus puts him at variance with the assumptions of modern logic. But Anderson considers that modern logic and its refinements are derivative from realist logic, in that without prior recognition of the truths of that logic, modern logic would have no objective basis. In any case his logic provides a thoroughgoing realist version of syllogistic logic by requiring all propositions to be contingent and all terms, including their ‘logical opposites’, to be non-empty, and by paying considerable attention to complex terms and to arguments other than syllogistic ones.

The logic is also closely connected with Anderson’s theory of space, time and the categories, which is a revised version of Alexander’s theory, and ties in the categories with the form of the proposition as a kind of realistic parallel to Kant’s ‘metaphysical deduction’ of the categories (see Alexander, S.). In Anderson’s theory, the categories - particularity, universality, causality and so on - are not compartmentalized, but as pervasive conditions of existence they are all present in all situations.

4 Theory of mind, determinism

Anderson takes a materialist view of mind, maintaining that mental phenomena have spatial, temporal, chemical and suchlike properties. He disagrees, however, with the identification of mind and brain (as made, for instance, by Armstrong 1968) on the grounds that this position is excessively physicalist. His own view is that there is a qualitative difference between mental and non-mental brain processes, consisting in the fact that mind is feeling or emotion.

Mental occurrences, he argues, are all caused, but we can distinguish certain *free* mental activities - ones which have a spontaneous, unstrained way of working - from activities which have a forced or compulsive character. Anderson is a 'pluralist determinist', criticizing conceptions of a single transitive chain of causes and the like. There are, he holds, separate, complex series of causal factors, interacting in various ways, as a result of which complete prediction is impossible. That is why his social theory is critical of social planners and would-be social engineers. Though every social occurrence has causal conditions, we cannot often predict what is going to happen, let alone bring it about; and furthermore social planning very often has undesired, unanticipated consequences.

One of his original conceptions concerns the causal 'field' - what the cause acts on to produce the effect, as when a virus causes a person to have influenza. Attention to the field helps clear up problems about necessary and sufficient conditions, causal series, and 'immediate', 'underlying', 'principal' causes and so on, since differing fields are involved.

5 Social thought

Anderson is a pluralist both in holding that society's way of working is pluralist and in espousing pluralist values. Against the claims of social voluntarism and atomism ('methodological individualism') that unitary individuals and subordinate relations between them are the main determinants of social affairs, he argues that 'forms of association are the primary social fact' (Baker 1979: 17) (see Individualism, methodological). These associations, such as movements and institutions, involve 'forms of psycho-social activity' passing through individuals: that is, these are forms of activity that exist in their own right. He likewise argues that solidarist or totalistic conceptions are falsified by the variety of factors which are present, including conflicts of group interests, some of which are irreconcilable. Appeals to the 'good of all', for example, disguise actual conflicts and have the covert effect of confusing issues and furthering certain special interests at the expense of other special interests. Social unity and harmony theorists, in Anderson's view, would be wise to heed what Heraclitus said long ago: 'Homer was wrong in saying: "Would that strife might perish from among gods and men!" He did not see that he was praying for the destruction of the universe; for if his prayer were heard, all things would pass away' (Burnet 1908: Fr. 43, 150).

In the case of Marx and Marxists, Anderson rejects their main totalistic conception of society and history and its associated 'philanthropic, servile and salvationist' ethic, but argues that there is a different, scientific and pluralistic strain in Marx's though which lays the foundation of a 'materialism of a non-totalistic kind' with its 'doctrine of social struggles throughout history'. With regard to freedom and democracy, Anderson argues that for people to be more than 'mere voting machines' what is needed is their active concern with the affairs of society at large and with those institutions to which they belong. Such activity is rarely widespread - all the less so with increasing government bureaucratization - but has enough strength to keep alive a permanent struggle of positive freedom against servility, which has its ups and downs (he here agrees with Vico and Croce) and is gauged by 'the extent of opposition to the ruling order, or criticism of ruling ideas' as carried on by resistant social groups (see Democracy).

Partly because Anderson was little known outside Australia and partly because of the range of his thought, much of his position was neither subjected to informed criticism, nor refined or worked out in detail.

Animal language and thought

The question of animal language and thought has been debated since ancient times. Some have held that humans are exceptional in these respects, others that humans and animals are continuous with respect to language and thought. The issue is important because our self-image as a species is at stake.

Arguments for human exceptionalism can be classified as Cartesian, Wittgensteinian and behaviourist. What these arguments have in common is the view that language and thought are closely associated, and animals do not have language. The ape language experiments of the 1960s and 1970s were especially important against this background: if apes could learn language then even the advocates of human exceptionalism would have to admit that they have thoughts. It is now generally believed that whatever linguistic abilities apes have shown have been quite rudimentary. Yet many sceptics are willing to grant that in some cases apes did develop linguistic skills to some extent, and clearly evidenced thought. Studies of other animals in captivity and various animals in the wild have provided evidence of highly sophisticated communicative behaviour. Cognitive ethology and comparative psychology have emerged as the fields that study animal thought. While there are conceptual difficulties in grounding these fields, it appears plausible that many animals have thoughts and these can be scientifically investigated.

1 Human exceptionalism versus continuity across species

Richard Sorabji (1993) has argued that debates about animal language and mind go to the core of the western philosophical tradition. Aristotelians and Stoics argued that only humans have reason or belief; some Platonists and Pythagoreans argued that these are shared by many kinds of animal. Indeed, Plato himself challenged the very framework presupposed by the debate. He thought that it was just as sensible to divide the world into cranes and non-cranes as humans and non-humans (see *Statesman* 263d).

Both human exceptionalism (HE) and continuity across species (CAS) have had strong supporters. HE was defended by Aquinas, Descartes and many twentieth-century linguistic philosophers, CAS by Voltaire, Hume and Darwin.

Although it is easy to characterize HE and CAS generally, it is difficult to do so precisely. Roughly, those who espouse HE believe that humans are unique in having language and sophisticated thought, and that there is a deep chasm between these human capacities and whatever thoughts and communication systems other animals may have. Those who embrace CAS hold that humans share the capacity for language or thought with at least some other animals and that the differences with respect to these capacities between humans and other animals are gradual and incremental.

However advocates of HE need not hold that humans are exceptional with respect to every capacity and every animal. They may contemplate honorary humanhood for dolphins (for example), or grant that a few other animals have thoughts but insist that these thoughts are always first-order or nonconscious, and thus very different from the thoughts that humans are capable of having. Defenders of HE may allow that many animals have communication systems, but then go on to claim that these are vastly weaker and less sophisticated than human language.

Supporters of CAS may grant that humans are capable of having some thoughts that no other animal can have. But they will generally see this as an evolutionary fact about humans that is not importantly different from other evolutionary facts about other animals. Perhaps only humans can ponder the neurophysiology of the wildebeest, but lions can think thoughts about wildebeests that humans cannot conceive. Defenders of CAS sometimes grant that only humans use language, but they often see this as a matter of definition or otherwise trivial. They are inclined to see complex communication systems as similar to languages or as sophisticated and important. Although the difference between HE and CAS may be vague, proponents of HE assert that there are enormous differences between humans and animals that centre on language and thought while advocates of CAS deny this.

The dispute between HE and CAS is important for several reasons. If animals lack central features of language and thought that humans have, then a profound gulf separates us from them. The existence of this gulf may have implications about the relations between the natural sciences and the human sciences. It may also justify discontinuous moralities with respect to humans and animals (see Animals and ethics; Moral standing). If HE is

correct, then we may be justified in seeing ourselves as special - perhaps even as ‘the crown of creation’. On the other hand, if CAS is correct, this may mean that action theory and philosophy of language should be seen as branches of ethology, and that our treatment of animals is a moral scandal. We may have to give up the view of ourselves as morally and metaphysically privileged, and instead see ourselves as one animal species among many. What is potentially at stake in arguments about animal language and thought is our human self-image - who we are, what we are like and what constitutes our proper relations with the rest of nature.

2 Arguments for human exceptionalism

Many philosophers have defended HE. Any attempt to collect these views into categories and to develop generic arguments involves regimentation. With these caveats in mind, it is useful to divide the arguments for HE into three categories: Cartesian, Wittgensteinian and behaviourist.

Cartesian views about animal language and thought have been influential on philosophers and linguists such as Vendler (1972) and Chomsky (1966). Although there is controversy about the exact nature of Descartes’ views about animals, the broad outlines are clear.

Chomsky credits Descartes with recognizing that language use is ‘creative’: it is both unbounded in scope and stimulus-free. Descartes wrote that while ‘magpies and parrots are able to utter words just like ourselves’ this is mechanical, ‘a movement of mere nature’ rather than a sign of thought (*Discourse on Method*, 1637: Part V). Having established to his satisfaction that animals do not have language, Descartes infers that they do not have thought, ‘for the word is the sole sign and the only certain mark of the presence of thought hidden and wrapped up in the body’ (letter to Henry More, 1649). Although Descartes is ambivalent about whether it can be proved that animals do not have thoughts, clearly he believes that they do not. Since animals do not have thoughts they do not have ‘real feeling’, for ‘real feeling’ involves propositional content and animals are incapable of propositional content because they do not have language.

Wittgensteinian accounts of animal language and thought have been given by Malcolm (1972-3) and Leahy (1991). Wittgenstein’s own views are characteristically difficult to unravel. In *Philosophical Investigations* (1953) he claims that animals ‘do not use language - if we except the most primitive form of language’, but appears to think that animals have sensations, emotions, intentions and first-order beliefs. However, Wittgenstein denies that animals have the power to simulate pain, to talk to themselves, or have attitudes about future events.

According to Malcolm, animals think but do not have thoughts. Having thoughts involves formulating and entertaining propositions, and he believes that animals are incapable of this. Although Malcolm (1972-3) does not identify thought with language, he claims that the relationship is ‘so close that it is really senseless to conjecture that people may *not* have thoughts, and also really senseless to conjecture that animals *may* have thoughts’. However, we know that animals think because ‘in real life we commonly employ the verb "think" in respect to animals’. Clearly Malcolm believes that animal thinking does not involve having thoughts, but says very little about how we are to understand it.

Behaviourists in both science and philosophy have denied animal language and thought (see Behaviourism, analytic; Behaviourism, methodological and scientific). Although some behaviourists deny thought to humans as well, most reserve their deepest scepticism for animals. Quine (1960) takes it as obvious that animals do not have language, and that ascribing thoughts to animals is an ‘essentially dramatic idiom’ - we imagine ourselves in the animal’s place and say what thoughts we would have were we the animal.

Davidson (1975) has produced the following argument for supposing that animals do not have thoughts: if an animal has a thought, then this thought must occur in a network of beliefs. This follows from Davidson’s holism which he takes from Quine: thoughts or beliefs come in ‘webs’, they cannot occur singly. In order to have a network of beliefs, an animal must have the concept of belief. This is because having a network of beliefs requires the ability to distinguish between someone holding a sentence to be true and the sentence actually being true. But having the concept of belief requires having language, for Davidson believes that this concept only arises in the context of linguistic interpretation. Since no animals have language they do not have the concept of belief. Since they do not have the concept of belief they do not have networks of beliefs. Hence, they do not have beliefs at all (see Davidson, D. §8).

What is striking about the arguments for HE, taken together, is that they turn on supposing a very close connection between language and thought. All of the arguments that we have reviewed suppose that having language is a necessary condition for having thoughts (although Malcolm grants that some kind of thinking may occur in the absence of language and thought). Moreover, some of these philosophers (for example, Malcolm) think that having language is sufficient for having thoughts.

It is against this background that the ape language experiments of the 1960s and 1970s caught the attention of philosophers. If it could be shown that apes could learn language then many philosophers would be convinced that apes are capable of having thoughts. Indeed, some philosophers would be convinced by nothing short of this.

3 The ape language controversy

Since the beginning of the twentieth century there have been at least half a dozen attempts to teach spoken language to an ape. In 1966 Beatrice and R. Allen Gardner began teaching American Sign Language to a chimpanzee named Washoe, and throughout the late 1960s and 1970s studies employing animals of different species using different communication systems were undertaken by David Premack, Duane Rumbaugh, Roger Fouts, Francine Patterson and others. In some cases extravagant claims were made about the linguistic abilities of these apes. These claims were deflated by Herbert Terrace in the late 1970s.

From 1973 to 1977 Terrace studied a chimpanzee named Nim Chimpsky. He concluded (1980) that there is no unequivocal evidence for supposing that apes can master syntactic, semantic or pragmatic aspects of language. Terrace’s results were devastating to the credibility and funding base of the ape language projects. The projects of Patterson and Fouts continue, funded primarily by private donations. The Rumbaugh project, now headed by Sue Savage-Rumbaugh, is one of the few that continues to produce significant scientific publications.

Beginning in 1981 Savage-Rumbaugh turned her attention to bonobos (so-called ‘pygmy chimpanzees’). Using a specially designed keyboard connected to a speech synthesizer one bonobo, Kanzi, has shown a surprising understanding of spoken English. He has a large vocabulary, is capable of communicating novel information and clearly follows simple syntactic rules. In a comparative study (1994) Savage-Rumbaugh concluded that the eight-year-old Kanzi’s linguistic skills were superior to those of a normal human two-year-old.

The ape language studies have been controversial from the beginning and continue to be so today. Terrace and other critics accuse most researchers of inaccurate observation and analysis, overinterpretation and cuing desired behaviour. Terrace has been faulted for failing to obtain results because of a lack of rapport with his subject and an impersonal training regime.

Animal behaviour, like human behaviour, is indeterminate, description-relative and open to interpretation. John Dupré (1991) has argued that the dispute over the ape language experiments primarily involves conflicts about the goals and methods of scientific research. The critics demand that claims about the linguistic abilities of apes be backed by compelling evidence that conforms to the most rigorous canons of scientific methodology. However, in the case of humans, language develops in a highly complex and emotive context and the application of principles of charity is an important part of the language-learning process (see Charity, principle of §4). It may be that there is an intrinsic conflict between teaching apes language in the most effective way possible and doing so in a way that will satisfy the scientific scruples of the sceptics.

It is clear that the ape language experiments have not convinced philosophers that at least some animals have language and therefore thoughts. However, one point is worth considering. Even sceptics may admit that some apes have demonstrated linguistic capacities to some degree or in some respect. But a similar view with respect to having thoughts is difficult to even understand. Having a thought appears to be an all or nothing matter. This may provide some evidence against the view that language and thought are as closely tied as some philosophers have claimed.

4 Animal communication

Even some scientists and philosophers friendly to the idea that animals have thoughts have been sceptical of the ape language experiments. For these experiments have focused on very few individuals from an even smaller number of species. They have been directed towards eliciting a variety of behaviours that these animals do not

manifest under natural conditions.

In addition to the ape language experiments there have been other interesting studies of the communication abilities of other captive animals (see Bekoff and Jamieson 1995; Ristau 1991). Louis Herman has claimed that bottle-nosed dolphins are capable of semantic and syntactic processing that ‘utilize a rich network of mental representations when responding to language-mediated tasks’, although they are less able to produce semantically and syntactically dense utterances. Irene Pepperberg has trained an African grey parrot to respond accurately to questions about the colour, shape, name and category of a variety of objects.

Under natural conditions many animals engage in highly sophisticated communicative activities. Cheney and Seyfarth have shown that vervet monkeys distinguish several different kinds of alarm call and behave appropriately with respect to each. Carolyn Ristau suggests that the broken wing displays in various species of plovers may be intended to lead intruders away from their nests. Deception has been claimed for a variety of animals including chimpanzees and elephants.

5 Thought without language

As we have come to know more about animals, the possibility that they may have thoughts without language has become increasingly plausible to many people. Even Joel Wallman (1992), one of the most thorough-going critics of the ape language experiments, holds that apes are ‘highly intelligent’, ‘reflexive’ and capable of ‘impressively abstract mentation’. Cognitive ethology and comparative psychology have emerged as the scientific fields that study the cognitive capacities of animals that may underlie some of their behaviour.

The dominant view in cognitive ethology, as well as among some philosophers who have written about cognitive ethology, is that an animal’s cognitive states must be inferred from its behaviour. Since an animal’s mental states are never observed but only inferred, the claim that an animal has a particular mental state or cognitive capacity can only be more or less probable. Often it is said even by cognitive ethologists that we can never really know that animals have thoughts.

In my view, this way of approaching the question of animal thought is fundamentally flawed. If by hypothesis the existence of animal thoughts can only be known by inference from behaviour, then it will always be an open question whether or not animals have thoughts. But if there are no convincing conceptual arguments for supposing that they do not, then we are justified in approaching the question of animal thoughts in the way that we approach the question of human thoughts. For there is no behaviour that an animal can engage in that will ineluctably drive us to the conclusion that it has thoughts. But if we were to view the claim that humans have thoughts as an inference from human behaviour, a sceptic could consistently deny the conclusion (see Other minds). As a matter of fact, however, we learn to view other humans as having thoughts in the process of psychological and social development. In many cases it is true to say that we see their thought in action. We can be wrong about the content of a particular thought, and indeed some versions of solipsism and scepticism may be logically possible or even defensible in a philosophy journal or seminar. But we do not confuse this with the practices of everyday life. Similarly, it seems that viewing some animals as sometimes having thoughts is part of our cultural practice. While we can take a sceptical stance and it may be useful to do so for certain methodological purposes, there is little reason to do so when it comes to fixing our beliefs. The idea that we are continuous with animals, unless it can be shown otherwise, appears to be a plausible naturalistic hypothesis.

Some philosophers may still be bothered by the fact that animals do not have full-blown human languages. But many animals may have powerful enough, nonlinguistic, representational systems to make their thoughts a significant possibility. For that matter, philosophers such as Ryle who deny that thinking necessarily involves manipulating representations may well be correct. At this stage in the investigation, the possibility that animals may have thoughts without language does not appear to be blocked by any convincing philosophical argument.

Animals and ethics

Does morality require that we respect the lives and interests of nonhuman animals? The traditional doctrine was that animals were made for human use, and so we may dispose of them as we please. It has been argued, however, that this is a mere 'speciesist' prejudice and that animals should be given more or less the same moral consideration as humans. If this is right, we may be morally required to be vegetarians; and it may turn out that laboratory research using animals, and many other such practices, are more problematic than has been realized.

1 The traditional view

In some Eastern systems of thought, animals are accorded great respect. The Jains of India hold that all life is sacred, drawing no sharp distinction between human and nonhuman life. They are therefore vegetarians, as are Buddhists, whose sacred writings forbid all needless killing. In the West, however, it was traditionally believed that animals were made for human use. This idea, familiar from the Old Testament book of Genesis and elaborated by a long line of Jewish and Christian thinkers, also formed part of Aristotle's worldview. Aristotle taught that 'nature does everything for a purpose', and so, just as plants exist to provide food for animals, animals exist to provide food and other 'aids in life' for humans (see Regan and Singer (eds) 1989).

This was cosmology with a moral point. Aquinas, who emphasized that it was God himself who provided the animals for human use, made the point explicit: 'Therefore,' he said, 'it is not wrong for man to make use of them, by killing or in any other way whatever' (*Summa contra gentiles*). Are there, then, no limits on how animals may be treated? One might think we have a duty to be kind to them out of simple charity. But Aquinas insisted that this is not so. 'Charity,' he said, 'does not extend to irrational creatures.'

There was, however, one way in which animals could gain a degree of protection. They might be the incidental beneficiaries of obligations owed to humans. If someone has promised to look after your dog, he is obliged to care for it. But the obligation is owed to you, not to the dog. There might even be a general duty not to torment animals, because, as Kant put it, 'He who is cruel to animals becomes hard also in his dealings with men' (1780-81: 240). But once again, the point was to protect the men, not the animals. (This has sometimes been called the 'indirect duty view' - that we can have duties to animals, but only indirect ones.)

This view might seem extreme in its near total disregard for nonhumans. Nevertheless, the idea that animals are essentially resources for human use was accepted by almost every important thinker in the Western tradition - including such figures as St Francis, who is popularly but wrongly believed to have advocated a more charitable stance. For this view to be defensible, however, there must be some difference between humans and other animals that would explain why humans have a privileged moral status. Traditional thought cited two such differences. For Aristotle, the difference was that humans alone are rational. Religious figures added that man alone was made in the image of God. These explanations seemed sufficient until 1859, when Darwin's *On the Origin of Species* (1859) transformed our understanding of man's relation to the rest of nature (see Darwin, C.).

2 Challenges to the traditional view

Darwin demonstrated that humans are not 'set apart' from other animals, but are related to them by evolutionary descent (see Evolution, theory of). It is no accident that we bear such a startling resemblance to the apes. Our bones and muscles are but modified versions of the ape's bones and muscles - they are similar because we inherited them from the same ancestors. The same is true of our rational faculties. Man is not *the* rational animal, for other animals also possess a degree of rationality. How could it be otherwise, when our brains developed from a common source? Darwin went so far as to declare, 'There is no fundamental difference between man and the higher mammals in their mental faculties' (1859: 35). Such differences as do exist, he said, are matters of degree, not kind.

Today it is widely accepted that Darwin was right, at least in the main outlines of his view, and this poses an obvious ethical dilemma: if humans are similar in so many ways to other animals, and humans merit moral protection, then why should other animals not merit protection too? As Asa Gray, Darwin's friend in America, put it, 'Human beings may be more humane when they realize that, as their dependent associates live a life in which man has a share, so they have rights which man is bound to respect' (1880: 54). Darwin himself regarded cruelty

to animals, along with slavery, as one of the two great human moral failings.

Another nineteenth-century development also cast doubt on the traditional exclusion of animals from the range of moral concern. The utilitarians, led by Jeremy Bentham and John Stuart Mill, argued that morality is fundamentally a matter of seeking to promote happiness and prevent suffering (see Utilitarianism). But Bentham saw no reason to limit moral concern to human suffering. In fact, he suggested that disregard for animals was a form of discrimination analogous to racism:

> The day may come when the rest of the animal creation may acquire the rights which never could have been withholden from them but by the hand of tyranny. The French have already discovered that the blackness of the skin is no reason why a human being should be abandoned without redress to the caprice of a tormentor. It may one day come to be recognized that the number of the legs, the villosity of the skin, or the termination of the os *sacrum* are reasons equally insufficient for abandoning a sensitive being to the same fate…. The question is not, Can they *reason*? nor, Can they *talk*? but, Can they *suffer*?
>
> (1789: 311; original emphasis)

It must be noted, however, that for most of Western history the moral status of animals did not seem to be much of an issue, and philosophers did not write very extensively about it (Bentham's discussion, for example, is confined to a footnote). The subject began to be widely discussed among philosophers only after the publication of Peter Singer's *Animal Liberation* in 1975.

3 The contemporary debate

One of the striking things about the debate concerning animals is that it is possible to reach radical ethical conclusions by invoking only the most common moral principles. The idea that it is wrong to cause suffering, unless there is a sufficient justification, is one of the most basic moral principles, shared by virtually everyone. Yet the consistent application of this principle seems to lead straight to vegetarianism or at least to the avoidance of factory-farmed meat. The argument is disarmingly simple. In modern factory farms, animals who are raised and slaughtered for food suffer considerable pain. Since we could easily nourish ourselves without eating them, our only reason for eating them seems to be our enjoyment of how they taste. So, unless one thinks our gustatory pleasure is a sufficient justification for causing torment, the obvious conclusion is that we are wrong to produce and consume such products.

Other arguments appeal to less commonplace notions. The word 'speciesism' was coined by Richard Ryder, a British psychologist who ceased experimenting on animals after becoming convinced it was immoral, and popularized by Singer in *Animal Liberation*. Speciesism is said to be analogous to racism. Just as racists unjustifiably give greater weight to the interests of the members of their own race, speciesists unjustifiably give greater weight to the interests of the members of their own species (see Discrimination §1).

Consider, for example, the very different standards we have for using humans and nonhumans in laboratory research. Why do we think it permissible to perform a painful and destructive experiment on, say, a rhesus monkey, when we would not perform the same experiment on a human? Someone might suggest that, say, humans are more intelligent than monkeys, or that their social relationships are more complex. But consider mentally retarded persons whose cognitive and social capacities are no greater than those of the animal. Would it be permissible to perform the same experiment on them? Many people think that, simply because they are human, it would not. This is speciesism laid bare: there is no difference between the human and the nonhuman in their abilities to think, feel or suffer, and yet the human's welfare is counted for more.

This line of thought suggests that animals may be treated differently from humans when, and only when, there are morally relevant differences between them. It may be permissible to admit humans, but not other animals, to universities, because humans can read and other animals cannot. But in cases where there are no relevant differences, they must be treated alike. This is the sense in which humans and nonhumans can be said to be morally 'equal': the bare fact that one is human never itself counts for anything, just as the bare fact that one has one skin colour or another never itself counts for anything. So we may not treat an animal in any way in which we would not be willing to treat a human with the same intellectual and emotional capacities.

Such arguments have, of course, provoked lively opposition. Many philosophers find it difficult to believe that

mere animals could have such powerful claims on us. Morality, they say, is fundamentally a human institution established to protect human rights and human interests (see Morality and ethics). Contractarianism, which has emerged in the latter half of the twentieth century as the principal rival to utilitarianism, makes this point most clearly. According to this view, morality rests on agreements of mutual benefit. Morality arises within a community when each person agrees to 'play the social game', respecting other people's rights and interests, provided others will do so as well. This agreement makes social living possible, and everyone benefits from it (see Contractarianism in ethics and political philosophy). But animals are unable to participate in such agreements, so they do not come within the sphere of moral protection.

In addition to initiating a philosophical debate, Peter Singer's book is perhaps the most conspicuous example of a philosophical work triggering a social movement. The animal rights movement, with its principled opposition to such practices as factory farming, the use of animals in commercial and scientific research, and the fur trade, has become a familiar part of contemporary life. Rarely, if ever, have philosophical thinking and social activism been linked so closely.

Anomalous monism

Anomalous monism, proposed by Donald Davidson in 1970, implies that all events are of one fundamental kind, namely physical. But it does not deny that there are mental events; rather, it implies that every mental event is some physical event or other. The idea is that someone's thinking at a certain time that the earth is round, for example, might be a certain pattern of neural firing in their brain at that time, an event which is both a thinking that the earth is round (a type of mental event) and a pattern of neural firing (a type of physical event). There is just one event, that can be characterized both in mental terms and in physical terms. If mental events are physical events, they can, like all physical events, be explained and predicted (at least in principle) on the basis of laws of nature cited in physical science. However, according to anomalous monism, events cannot be so explained or predicted as described in mental terms (such as 'thinking', 'desiring', 'itching' and so on), but only as described in physical terms. The distinctive feature of anomalous monism as a brand of physical monism is that it implies that mental events as such (that is, as described in mental terms) are anomalous - they cannot be explained or predicted on the basis of strict scientific laws.

1 Psychophysical identity and strict laws

Davidson proposed the following argument for a psychophysical identity thesis: let *m* be any arbitrary mental event that causally interacts with some physical event *p*. Events related as cause and effect fall under strict laws. But if *m* and *p* fall under a strict law, that strict law is a physical law as all strict laws are physical laws. If an event falls under a strict physical law, then it is a physical event. Hence, *m* is a physical event. As Davidson points out, if one makes the plausible assumption that every mental event causally interacts with some physical event, one can arrive by the same reasoning at the more general conclusion that every mental event is a physical event.

Although questions can be raised about various steps in this argument, its conclusion is fairly widely accepted (see Mind, identity theory of). The focus of attention has been on his claim that although mental events are physical events, there are no strict psychological laws (psychological anomalism) and there are no strict psychophysical laws (psychophysical anomalism) - the doctrines that make his version of monism count as a version of *anomalous* monism. Before discussing the anomalism theses, let us turn to the notion of a strict law itself.

According to Davidson, laws are true general statements that support counterfactuals and other subjunctive conditionals (see Counterfactuals), and which are confirmable by their positive instances. *Strict* laws are sometimes claimed to be laws that contain no escape clauses such as 'other things being equal', or 'typically', or 'for the most part', or the like. However, Davidson appears to have a stricter notion of law in mind than that. For the statement 'All sentient beings are mortal' contains no explicit escape clauses and expresses as exceptionless a law as one can hope to find, yet it appears that Davidson would not count it. His notion of a strict law is one that is as explicit, precise, and exceptionless as nature permits, or that can be refined into such a law by the addition of further explicit provisos and conditions stated in the same theoretical vocabulary as the original law statement. In contrast, nonstrict laws can be made exceptionless only by explicitly citing probabilities in the law itself, or, at the cost of explicitness and precision, by adding *ceteris paribus* clauses or hedges, or else by employing predicates (like 'sentient' and 'mortal') whose analyses require appeal to *ceteris paribus* clauses or hedges that cannot be fully spelled out in the same theoretical vocabulary as the original law statement. This difference between strict and nonstrict laws, according to Davidson, is due to the fact that strict laws, unlike nonstrict ones, are couched in the vocabulary of a closed, comprehensive theory. A theory *T* is closed if and only if events within the domain of *T* causally interact only with other events within the domain of *T*. A theory *T* is comprehensive if and only if every event within its domain satisfies a unique *T*-description under which it is subsumed by one of *T*'s laws. Davidson allows that while strict laws are, or can be refined into, laws as exceptionless as nature permits, a strict law, even fully refined, may prove to be probabilistic; but if it does, there will be no law covering exactly the same causal transactions it covers that is more explicit, precise, and has fewer exceptions. Nonstrict laws, Davidson says, can support causal claims concerning individual events. But they do so, he maintains, by providing evidence that there is a strict law at work that is free of either explicit or implicit escape clauses, and that precisely states all the causal factors at work in the particular causal transactions in question.

Davidson's notion of a strict law remains a subject of interpretation. The following is textually defensible. A strict

law is a law that is couched solely in a basic vocabulary of a closed, comprehensive theory, or in terms that can be defined by terms logically constructible from such a basic vocabulary, or be reduced by bridge laws to terms so constructible; a nonstrict law is a law not couched in such terms, or solely in such terms. A set of terms is a basic vocabulary of a closed comprehensive theory if and only if it is a set of terms sufficient for the formulation of a closed comprehensive theory, and no proper subset of it is.

2 Psychological anomalism

Davidson argues as follows for psychological anomalism. Psychology is not a closed theory; and, further, psychological terms cannot be incorporated by reductive bridge law or definition into the vocabulary of a closed, comprehensive theory. Therefore, there are no strict psychological laws.

Psychology is indeed not closed; there is overwhelming empirical reason to believe that there are nonmental events that causally interact with mental events. To be sure, biology is not a closed theory either; indeed, none of the special sciences is closed. Davidson tells us that most of science employs only nonstrict laws. He holds, however, that strict laws can be found in physics, either in current physics, or, if it falls short of what it promises to be (that is, closed and comprehensive), then in some (as yet unstated, perhaps never to be stated) improved version of current physics. All strict laws are either laws of physics or laws that can be refined to laws of physics by appeal to reductive laws and/or definitions, and (if necessary) adding physical provisos.

Some philosophers maintain, on the following grounds, that special science laws, including even chemistry, are typically not strict since they cannot be so refined: the event and state types cited in special science laws are, typically, widely and multiply realized by the event and state types cited in physics, and hence the former cannot be reduced to the latter. Davidson has, however, marshalled reasons for holding that certain mental predicates, in particular, cannot possibly be reduced to physical predicates, reasons which make no appeal to the notion of realization. The predicates in question are ones that contain essential occurrences of propositional attitude verbs such as 'believes', 'desires' and the like (see Propositional attitudes). Davidson maintains that propositional attitude concepts are such that predicates that express them could not possibly be reduced to physical predicates. His reasons are discussed in the following section. (Hereafter, 'mental event' will be used in a restricted sense to mean acquiring or losing a propositional attitude.)

3 Psychophysical anomalism

One way that psychophysical anomalism could fail is if there is a basic vocabulary for a closed, comprehensive theory that includes both mental and physical terms. A Cartesian interactionist (see Dualism) might argue that any basic vocabulary for a closed, comprehensive theory true of our world would have to contain both mental and physical terms; for the mental properties expressed by at least some mental terms are fundamental force-generating properties. However, this position is empirically implausible: mechanics seems to have no need of the hypothesis that there are mental events.

There is another way that psychophysical anomalism could fail, namely if mental terms can be defined by terms constructible from the basic vocabulary of a closed, comprehensive theory or be reducible to such terms by reductive bridge laws. Davidson offers reasons that appeal to the nature of mental concepts for holding that no mental predicate (more specifically, no propositional attitude predicate) could be reduced to any physical predicate, no matter how complex, in either of these two ways. If definitional psychophysical reduction were possible, then a physical predicate could express an unhedged sufficient condition of application for a mental predicate - one unqualified by any escape clauses. That, Davidson argues, is impossible: no physical predicate could express such an unhedged sufficient condition of application. Hence, definitional reduction is impossible. The same consideration arguably shows that reduction via bridge laws is impossible. For if a psychophysical bridge law were a reductive law, rather than an emergent law, the law would have to be a derivative law, rather than a fundamental law. The law would have to be implied by laws of the reducing theory, physical theory, together with physical conditions, and only analytical principles, and perhaps other necessary truths. Otherwise, the truths of physical theory itself would not imply the psychophysical truths in question. It is arguable that if the truths of physical theory itself imply such psychophysical truths, then unhedged analytical generalizations with physical (and logical) predicates in their antecedents and mental predicates in their consequents would be possible. But such generalizations are impossible if mental predicates could not have unhedged physical conditions of

application. Davidson does not consider the possibility, however, that there are metaphysically necessary truths that are not analytical truths, and that enable psychophysical reduction; of that consideration, more in §4.

There are, in Davidson's work, several lines of argument for the claim that mental predicates cannot have unhedged physical sufficient conditions of application; and other proponents of psychophysical anomalism have contributed to the development of some of these lines of argument. Much of the interest in anomalous monism has centred on whether a sound argument for the claim can be found.

Every line of argument appeals to what Davidson calls 'the holism of the mental' - (roughly) the view that propositional attitude types, identified by their intentional mode (for example belief) and their content (for example that the earth is round), are individuated holistically by their place in a network of other propositional attitude types. The place of a propositional attitude state type in such a network is partly determined by logical and semantical relationships between its content and the contents of a vast range of other state types in the network. For networks of propositional attitude types must, Davidson argues, exhibit a large degree of rational coherence. Irrationality is possible, obviously, but only against a background of largely rational coherence. To make coherent propositional attitude attributions, our attributions must conform to standards of rational coherence, standards concerning what it would make sense to believe given certain other beliefs, what it would make sense to value given certain beliefs and desires, and what courses of action would make best sense given a certain pattern of beliefs, desires, values, and so on.

One line of argument is that if unhedged physical conditions of application were possible, propositional attitude attributions could be made solely on the basis of such conditions, and thus without reliance on rational assessment. But that, it is claimed, would amount to changing the subject, since principles of rational assessment are constitutive of the very meaning of such mental predicates. This line of argument is, however, inconclusive. If there are constitutive principles of rational assessment that implicitly define mental predicates, then, indeed, unhedged sufficient physical conditions of application cannot permit attributions that contravene the principles without changing the subject. Nevertheless, so long as those principles would not be contravened by attributions made solely on the basis of unhedged physical conditions, there would be no change of subject. It thus remains to be seen why such attributions would have to contravene principles of rational coherence.

It has also been argued, however, that there is no complete set of impersonal, objective principles of rational coherence. This idea has been put by saying that there is no complete set of codifiable principles of rationality that can supply a common, objective standard in attributing mental states to others. We must rely on our own standards of assessment in understanding others; there is no single objective standard to which we can appeal. The claim that there are no codifiable objective standards of rationality is contentious. Decision theory and confirmation theory, for instance, attempt to formulate such standards (see Confirmation theory; Decision and game theory). Perhaps they cannot succeed, but if they cannot, it remains to be seen why they cannot. Suppose, however, that there is indeed no single set of codifiable objective standards of rationality, that there are at best rules of thumb, and that we must invariably rely to some extent on our subjective sense of what makes rational sense - what it makes sense to believe given other beliefs, and so on - in making mental attributions. The question arises, then: would this imply that unhedged physical conditions of application for propositional attitudes would invariably contravene our assessments of rational coherence?

If there is a set of codifiable principles of rational assessment for each attributor at a time, then such contravention might be avoidable. When two individuals' propositional attitude attributions are governed by somewhat different sets of principles, there would arguably be some difference in the meanings of the propositional attitude predicates they employ. Similarly, the meanings of propositional attitude predicates a given individual employs would arguably change somewhat over time as somewhat different sets govern the individual's attributions at different times. Propositional attitude predicates could be, in principle, rendered unambiguous by relativizing them to such sets of principles. Unhedged physical sufficient conditions of attribution for mental predicates understood as governed by a particular set of principles of rationality would, then, have to be such that they do not contravene the principles. However, if they did not, there would be no change of subject.

It might be responded that there will be no set of codifiable principles of rational assessment even for an attributor at a time. But a case for that remains to be made. In any event, for present purposes, suffice it to note that the reasoning in favour of psychophysical anomalism remains a topic of controversy.

4 Psychophysical anomalism and supervenience

While Davidson denies that mental characteristics reduce to physical characteristics, he maintains that they are supervenient on physical characteristics in this sense: there cannot be two events alike in every physical respect but differing in some mental respect. Various kinds of supervenience relations have been distinguished (see Supervenience; Supervenience of the mental). The kind Davidson appeals to appears to be a particularly weak kind. While he eschews talk of possible worlds, it can, nevertheless, be stated by quantifying over them: for any possible world, *w*, if any event *x* in *w* differs in any mental respect from event *y* in *w*, then *x* differs in some physical respect from *y*. This weak psychophysical supervenience thesis implies neither strict nor nonstrict psychophysical laws, and is thus compatible with psychophysical anomalism.

Many philosophers hold, however, that mental characteristics must supervene on physical characteristics in the following stronger sense, if mental characteristics indeed make a difference to causal relations: for any possible worlds *w* and *w**, and any event *x* in *w* and any event *y* in *w**, if *x* and *y* differ in some mental respect, then they differ in some physical respect. This strong supervenience thesis, in conjunction with the assumption that physical conditions are closed under complementation (negation will be part of the basic vocabulary of physical theory), implies that for any propositional attitude type, there is some unhedged, metaphysically sufficient physical condition for its occurrence. Strong psychophysical supervenience is thus incompatible with the thesis that mental predicates cannot have such physical conditions of application.

Strong psychophysical supervenience is, however, arguably compatible with psychophysical anomalism itself. For, laws, according to Davidson, must be confirmable by their positive instances, and that there are such metaphysically sufficient unhedged, physical conditions does not imply that there are true, unhedged psychophysical generalizations that are confirmable by their positive instances. Moreover, psychophysical anomalism remains a deeply interesting doctrine, even if it is compatible with the possibility of unhedged metaphysically sufficient physical conditions of application for propositional attitude predicates. For it is deeply interesting whether our propositional attitude concepts are such that generalizations purporting to state such conditions of application could be confirmable by their positive instances.

Anscombe, Gertrude Elizabeth Margaret (1919-)

Elizabeth Anscombe has contributed to all principal areas of philosophy, most influentially to ethics and the philosophy of mind. She is the founder of contemporary action theory, and an important source of the revival of interest in virtue ethics. The chief influences on her thought are the work of her teacher, Ludwig Wittgenstein, much of which she has translated and of which she is an important interpreter, and the classical and medieval traditions, as found in Aristotle and Aquinas. She has also made a number of contributions to the defence of Roman Catholic religious belief.

1 *Intention*

Anscombe's most important work, *Intention* (1957a), is the founding document of contemporary philosophy of action. Much of her later thought may be said to move out from this essay in three main directions: towards ethics; general problems of explanation or 'causality'; and associated problems in the philosophy of mind.

The concept of intention is employed, she says, in three main connections: we speak of 'events in a man's history' as *intentional actions*, of the *intention with which* an action is performed, and of the *expression of intention*, or of the corresponding 'pure' intention for the future, which may exist though no action has yet been done with that intention. Taking the notion of intentional action as prior, she argues that an action is intentional when it is subject to a certain form of explanation: that is, when, as she puts it, 'a certain sense of the question "Why?" has application' to it. Her task is then to isolate this particular form of explanation. It is without application, she argues, if the agent is unaware of doing the thing; or if the agent knows that he or she is, but only by having noticed it - that is, 'by observation', or where, though the agent knows that the thing is going on without observation, he or she can give no account of it, or none without observation, conjecture and so forth. If a piece of behaviour passes these tests, it is an intentional action, unless perhaps it is a case of 'mental causality', like a gasp that is given at the hissing of a snake. These latter cases she excludes by a series of more complex tests (see Action §1; Intention §5).

Like Oedipus, I may *strike a person* intentionally, and *strike my father* unintentionally, though these are not two distinct events or two distinct actions of mine. Actions are thus intentional only 'under a description'. What is given in answer to the question 'Why?' is in fact often a further description of the same action. A series of such questions will thus reveal an order among many of the descriptions true of an action: 'Why are you moving your arm up and down?' -'Because I'm pumping water' - 'But why pump water?' - 'Because I'm replenishing the house water supply'. This chain of questions 'Why?' may often be pressed into the future, and thus beyond any description of what is now happening; the responses will then merely express the *intention with which* the action mentioned earlier is performed. In general, if the question 'Why?' has application to a first-person future-tense description of action, then the description is an *expression of intention* and not a mere prediction.

The idea that 'practical knowledge' (the knowledge one has of one's intentional action) does not spring from observation leads to some of the more striking claims of the work. She famously compares the relation that practical thought bears to action with the relation a shopping list bears to the contents of the shopper's basket. The corresponding model of non-practical or 'speculative' thought is given by the relationship between the same basket and the list of its contents constructed by the detective who follows its owner. The difference is in 'direction of fit', as it is now called: the detective amends a mismatch between list and basket by altering his list, the shopper by altering the contents of the basket. These matters are elucidated by an extended discussion of Aristotle's notion of a 'practical syllogism'. It is argued, among other things, that the order of descriptions of an action which we elicit with the question 'Why?' is the reverse of the order of descriptions articulated by the agent in reasoning from end to means (see Practical reason and ethics §3).

2 Other works

Much of Anscombe's ethical work also concerns the notion of intention and the relationship of thought to action. In 'Modern Moral Philosophy' (1958) she argues that contemporary thought on these matters is so wide of the mark that there is no point in practising moral philosophy at all. A naïve philosophy of mind and action has led, for example, to what she calls 'consequentialism' - the view that whether a person intends something or not is

irrelevant to the question whether he is responsible for it (see Consequentialism §1). (In 'Mr. Truman's Degree' (1957b) she claims that the familiar justifications for the bombing of Hiroshima and Nagasaki, which she argues was murderous, presuppose just such thinking.) She also maintains that the programme of attempting to elucidate the 'moral sense of "ought"' must be jettisoned: it presupposes a theory of ethics as founded in divine law. Only an Aristotelian ethical theory, she thinks, can be given an intelligible secular development. But this would require clarification of such concepts as 'virtue', 'human nature' and 'human flourishing', and thus renewed inquiry into philosophy of mind and action (see Virtue ethics §2).

In 'Causality and Determination' (1971), Anscombe attacks the notion that 'if an effect occurs in one case and a similar effect does not occur in an apparently similar case, there must be a relevant further difference' (1971: 133). Having attacked this view, she attempts to show how freedom of the will, which she argues is incompatible with it, is to be understood in the light of its rejection. An event not explicable in terms of prior determining physical causes may yet, she argues, be subject to other forms of explanation.

Much of Anscombe's work on the general philosophy of mind attempts to extend and clarify the teachings of Wittgenstein (§13). Her boldest claims are found in 'The First Person' (1974). There she argues that the word 'I' is not a referring term, that self-consciousness is not awareness of an object (a 'person' or 'self'), and that if either of these things *were* the case then the object of reference and awareness would have the character of a Cartesian ego.

Anselm of Canterbury (1033-1109)

Anselm of Canterbury, also known as Anselm of Aosta and Anselm of Bec or Saint Anselm, was first a student, then a monk, later prior and finally abbot of the monastery of Bec in Normandy, before being elected Archbishop of Canterbury in 1093. He remains one of the best-known and most readily engaging philosophers and theologians of medieval Europe. His literary corpus consists of eleven treatises or dialogues, the most important of which are the philosophical works Monologion and Proslogion and the magnificent theological work Cur deus homo (Why God Became a Man). He also left three meditations, nineteen prayers, 374 extant letters including Epistolae de Sacramentis (Letters on the Sacraments) and a collection of philosophical fragments, together with a compilation of his sayings (Dicta Anselmi) by Alexander, a monk of Canterbury, and a compilation of his reflections on virtue, De morum qualitate per exemplorum coaptationem (On Virtues and Vices as Illustrated by a Collage of Examples), possibly also by a monk at Canterbury.

At Bec Anselm wrote his first philosophical treatise, the Monologion, a title signifying a soliloquy. This work was followed by the Proslogion, the title meaning an address (of the soul to God). At Bec he also completed the philosophical dialogues De grammatico (On (an) Expert in Grammar), De veritate (On Truth), De libertate arbitrii (Freedom of Choice) and De casu diaboli (The Fall of the Devil). Near the end of his time at Bec, he turned his attention to themes more theological, drafting a first version of De incarnatione Verbi (The Incarnation of the Word) before September 1092 and completing the final revision around the beginning of 1094. During his time in office at Canterbury, which included two long exiles from England (1097-1100 and 1103-6), he wrote the Cur deus homo, followed by the concisely reasoned treatises De conceptu virginali et originali peccati (The Virgin Conception and Original Sin), De processione Spiritus Sancti (The Procession of the Holy Spirit) and De concordia praescientiae et praedestinationis et gratiae dei cum libero arbitrio (The Harmony of the Foreknowledge, the Predestination and the Grace of God with Free Choice).

Though his principal writings at Bec were more philosophical while his foremost writings as archbishop were more theological, still we must remember that Anselm himself made no express distinction between philosophy and theology, that at Bec he also wrote two meditations and sixteen prayers, and that his Cur deus homo and De concordia, in dealing with the weighty theological doctrines of atonement, predestination and grace, incorporate philosophical concepts such as necessitas praecedens (preceding necessity) and necessitas sequens (subsequent necessity).

Anselm's most famous philosophical work is certainly the Proslogion, while his most influential theological work is undoubtedly the Cur deus homo. The style of the Proslogion imitates that of Augustine in the Confessiones, where the soul invokes God as it prayerfully reflects and meditates. By contrast, the Cur deus homo is cast in dialogue form because, as Anselm states in I.1, 'issues which are examined by the method of question and answer are clearer, and so more acceptable, to many minds - especially to minds that are slower.' About his aims in the Proslogion there is no scholarly consensus. The traditional view holds that he is undertaking the twofold task of demonstrating the existence of God and demonstrating certain truths regarding God's attributes. In carrying out this task, he has recourse to a single consideration (unum argumentum), namely, that God is aliquid quo nihil maius cogitari potest (something than which nothing greater can be thought). This single consideration gives rise to a single argument form; the logical structure of the reasoning which purports to establish that quo nihil maius is actually existent is also the structure of the arguments which conclude that quo nihil maius is so existent that it cannot be thought not to exist, is alone existent per se, is omnipotent, merciful yet impassable, is supremely just and good, is greater than can be thought, and so on. According to this interpretation, the Proslogion seeks to establish most of the same conclusions that were reached in the earlier Monologion, but to establish them more directly, simply and tersely.

The central thrust of the Cur deus homo may be discerned from the title: namely, to explain why it was necessary for God, in the person of the Son, to become a man (that is, to become incarnate as a human being (homo)). Anselm uses the Latin word homo generically and not in the sense of male (vir). This fact is seen clearly in Cur deus homo II, 8: 'nil convenientius, quam ut de femina sine viro assumat [deus] illum hominem quem quaerimus' (nothing is more fitting than that God assume from a woman without a male that man [human being] about whom we are inquiring). Though the sense of homo varies in accordance with whether Anselm is speaking

about a human being or about a human nature, there is no doubt about the meaning of the title: the Son of God assumed a *human nature, thereby becoming* a *man; he did not assume another man (in other words, assume a human person together with a human nature) as the heretical Nestorians had taught, nor did he become man (in other words, become universal man, by assuming unindividuated human nature as such).*

Anselm's detailed theory of satisfaction for sin was in large measure a putative theoretical justification of the institutionalized practices of the confessional and the penitential system as found in the medieval Christian church, which understood every sin to constitute a punishable demerit and to require both the imploring of God's forgiveness and the making of amends for having dishonoured him. Throughout the intricate and sustained reasoning of the Cur deus homo, Anselm seeks to show one central truth: 'because only God can make this satisfaction and only a man ought to make it, it is necessary that a God-man make it' (Cur deus homo II, 6).

As in the Cur deus homo, so also in his other treatises Anselm proceeds insofar as he deems possible, sola ratione *(by recourse to rational considerations alone). Accordingly, he is rightly called the 'Father of Scholasticism'. He understands* ratio *in a broad sense, broad enough to encompass appeals to experience as well as to conceptual intelligibility. Although the main intellectual influence upon him was Augustine, he is less platonistic than the latter, and the influence of Aristotle's De interpretatione and Categories (from Boethius' Latin translations) is clearly discernible in his philosophical works.*

1 Biography

Major details of Anselm's life come down to us through his contemporary secretary and biographer, Eadmer, an English monk at Canterbury and author of the *Vita Anselmi (Life of Anselm)* and *Historia Novorum in Anglia (History of Recent Events in England)*. Eadmer knew little of, and reported meagrely on, Anselm's childhood and youth. It is known that Anselm was born of noble lineage in the Burgundian town of Aosta, near the border with the Kingdom of Lombardy (now in Italy). In 1056, however, several years after his mother's death and as a result of his father's hostility, Anselm left home. Some three years later, following intermittent studies, he arrived at the Benedictine Abbey of Bec in Normandy, having journeyed there to place himself under the tutelage of the Abbey's prior and schoolmaster, Lanfranc of Pavia. He was then twenty-six years old.

After his father's death (presumably in 1060), Anselm chose to enter the monastic order at Bec rather than return to the family estate. In 1063 he was elected prior of Bec, succeeding Lanfranc, who had been called to the abbey of St.-Etienne in Caen; in 1078 he was chosen abbot, in spite of his disinclination to assume the office. He showed even more reluctance and protestation when selected as archbishop of Canterbury in 1093, again in succession to Lanfranc. Eadmer tells of Anselm's vigorous and poignantly futile efforts to resist election, first to the abbacy at Bec and later to the archepiscopacy at Canterbury. When the monks of Bec besought Anselm to dispense with the customary protests and agree to become abbot, he threw himself prostrate on the floor, begging them not to weigh him down with so burdensome an office. A similar scene took place in England: when King William II, fearing that his sudden sickness was mortal, named Anselm archbishop and when the bishops carried him forcibly to William's bedside to receive from him the episcopal staff, Anselm kept his fist clenched, thus refusing the staff. Nonetheless, the staff was pressed against his hand by the bishops, the *Te deum* was chanted and he was proclaimed archbishop-elect on 6 March 1093. His consecration followed on 4 December.

Anselm's subsequent quarrels with William II (son of William the Conqueror) and with his brother and successor Henry I are well known. He contested William's exercise of jurisdiction over the church, in particular William's claim that he alone, as king, was entitled to convoke future reform synods and had the right to decide which rival for the papacy - Urban II or Clement III - to recognize. Relations became so tense that Anselm, acting on his own initiative, chose to leave England for three years (November 1097-September 1100) to consult with Urban II in Rome. Upon his return to England after William's death, he then quarrelled with Henry I over Urban's injunction against any bishop doing homage to a king or being invested with his bishop's office by a king or any other layman. Anselm, at Henry's behest, once again departed from England for three years (April 1103-August 1106), this time to consult with Pope Paschal II. The investiture controversy was settled only in 1107, twenty months before Anselm's death, when King Henry formally forswore the right of investiture at the Concordat of London.

Two conflicting portraits of Anselm's mature life and of his attitude towards his roles as theologian and prelate have emerged. The standard portrayal, that of R.W. Southern, who agrees in general with Eadmer, shows Anselm

as a devout monk who was committed to the ideals of monasticism and who aspired to a life of scholarly study and spiritual meditation. Dreading to trade the tranquillity of Bec for the combative milieu of Canterbury, he experienced his elevation to the archbishopric as 'his nearest approach to hell' (Southern 1988: 187). In his preface to the *Cur deus homo (Why God Became a Man)*, Anselm spoke of his tribulation of heart and his great suffering, presumably because of his clashes with King William over the extent of regal power. Anselm seemed most content when he could withdraw from the public arena, as he did in the Italian mountain village of Liberi while finishing the *Cur deus homo*, during his first exile.

A contrary portrait of Anselm is that of S.N. Vaughn (1987), who dismisses much of Eadmer's report as tendentious and too intent upon depicting Anselm as a saint. Anselm, says Vaughn, was a man politically astute and personally calculating, manipulative enough to enlist the support of his friends against his enemies and clever enough actively to fashion a positive historical image of himself by omitting from his collection of letters those that would have cast him in a less favourable light. Moreover, his very remonstrations and protestations when assuming high office were not only a formality - the expected and requisite display of humility - but also a test of the intensity of his electors' support. In fact, Vaughn claims, Anselm adroitly schemed to become selected as archbishop once he became convinced that God had destined him for this office. He did not desire the office and its burdens; but, despite this disinclination, he manoeuvred cleverly to obtain it in compliance with the perceived will of God. Once in the office he executed it with talent, protecting against regal confiscation the holdings and preserving from regal encroachment the prerogatives of the previously weakened English church.

Both these mutually incompatible pictures of the historical Anselm seem extreme. Neither is likely to be shown conclusively wrong by future scholarly debate, except in the unlikely event that new evidence is forthcoming. Scholarly caution must be exercised, however, in attempting radically to reshape Eadmer's testimony that Anselm neither sought nor desired to become archbishop - testimony corroborated by Anselm's own letters and not clearly contradicted by circumstantial evidence.

2 Philosophical method

Anselm did not write his first philosophical treatise, the *Monologion*, until he was forty-three. Even his earliest letters, prayers and meditations do not antedate 1070. Thus his entire corpus of writings arises from his mature years, after he had already been a monk at Bec for at least ten to sixteen years. Not surprisingly, his works show a consistency that cannot be found in a more prolific writer such as Augustine, who in later years felt obliged to write *retractationes* (reconsiderations) of his earlier work.

Stylistically, Anselm often uses streamlined Latin sentences that are set out in simple vocabulary. However, his concise style and his well-focused treatment of topics do not ensure that his ideas are easy to understand. On the contrary, understanding is frequently impeded by his failure to introduce more elaborate distinctions and to explore the metaphysical complexities that underlie his ostensibly straightforward assertions. More like Aristotle than like Augustine, he introduces into his argumentation appeals to common linguistic parlance, as when he explains that our saying 'Nothing caused it' ordinarily means that it is not the case that anything caused it. Similarly, when we say that God is unable to sin (an expression that seems to convey the idea of imperfection because of powerlessness), we usually mean that God has the ability always to keep from sinning (and to have this ability is to have a perfection).

Anselm is called the 'Father of Scholasticism' because he endeavours to show that revealed truths can be established on an independent rational basis. In the *Monologion*, where he professes to proceed *sola ratione* (by recourse to rational considerations alone), he regards himself as having demonstrated not only that God exists but also that God is triune and that the human soul is immortal. Similarly, in the concluding chapter of the *Cur deus homo*, he claims unhesitatingly that 'whatever is contained in the Old and in the New Testament has been proved, by the solution of the single problem which we have set forth.' Thus he goes further than his predecessor Augustine and his successor Aquinas, neither of whom supposed that either the doctrine of the Trinity or the doctrine of the inerrancy of Scripture is rationally demonstrable.

An example of Anselm's reasoning as a Scholastic may be drawn from *De casu diaboli (The Fall of the Devil)* 21, which asks the question of whether Satan was able to foreknow that he would fall. Anselm begins by stating that either Satan did know this or he did not. On the assumption that he foreknew, he either was willing that the fall

should occur, or he was unwilling. Were he willing, however, then he did not foreknow a future fall, since he was already fallen by virtue of that evil consent; and if he were unwilling, then he who because of his sinlessness deserved to be happy would because of his foreknowledge have been filled with grief, a theological inconsistency. Hence, concludes Anselm, Satan was not able to foreknow that he would fall. In reaching this conclusion, he extends theological truth beyond what is overtly taught in Scripture.

The scholastic method of *sola ratione* characterizes most of Anselm's philosophical and theological works, ranging from the *Proslogion* (whose original title was *Fides quaerens intellectum (Faith Seeking Understanding)*) to the *Cur deus homo*, which appears to be tacitly oriented toward Scripture in spite of its purporting to presuppose nothing about Christ. In *De incarnatione Verbi (The Incarnation of the Word)* 6, Anselm explicitly links the method of the *Proslogion* with that of the *Monologion*, when he states that both of these works show that 'what we hold by faith regarding the divine nature and its persons - excluding the topic of incarnation - can be proven by compelling reasons (*necessariis rationibus*) apart from appeal to the authority of Scripture.' In this context, to proceed *necessariis rationibus*, as do both the *Monologion* and the *Proslogion*, is to proceed *sola ratione*. Moreover, in the *Cur deus homo* he elaborates upon the notion of *rationes necessariae* but does so without this notion's being at odds with that of *remoto Christo* (arguing without recourse to any knowledge of Christ derived from Scripture or from history). Furthermore, in the terminal chapter of the *Cur deus homo*, the interlocutor Boso summarizes: 'You prove the necessity of God's becoming a man, and you do so in such a way that even if the few things you have introduced from our books are removed (for example, what you mentioned about the three persons of God and about Adam), you would satisfy not only the Jews but also the pagans *sola ratione*.' Finally, in *De incarnatione Verbi* 6, Anselm intimates that even the *Monologion* can be characterized as *fides quaerens intellectum*. The same is true of the *Cur deus homo*, as is attested by Boso's last speech in I, 25.

The distinction that Anselm makes in the Cur deus homo between *rationes necessariae* and *rationes convenientes* (fitting reasons) is the following: necessary reasons are reasons that by themselves are compelling, while fitting reasons are weaker reasons that, nonetheless, are compelling in the absence of more powerful contrary considerations. With regard to fitting reasons and their compelling power, Anselm's proposal to Boso in the *Cur deus homo* is crucial:

> I would like for us to agree to accept, in the case of God, nothing that is in even the least degree unfitting and to reject nothing that is in even the slightest degree reasonable unless something more reasonable opposes it. For in the case of God, just as an impossibility results from any unfittingness, however slight, so necessity accompanies any degree of reasonableness, however small, provided it is not overridden by some other more weighty reason.
>
> (*Cur deus homo* I, 10)

The fact that an overall consistency of method characterizes Anselm's treatises does not mean that he never relied upon Scripture to furnish a premise needed for a given argument. However, he sought to avoid doing so, and it is interesting to note that he did not write a single commentary on any book of Scripture.

All of the foregoing serve to distinguish Anselm from Augustine, to whom he is nevertheless deeply indebted. The *Proslogion*'s very description of God as *aliquid quo nihil maius cogitari potest* (something than which nothing greater can be thought) seems to be drawn from *Confessiones* 7.4, and its theme *fides quaerens intellectum* is taken from Augustine's *Sermon* 44.6.7 (and ultimately from Isaiah 7: 9), just as in the *Monologion* the main ideas regarding the Trinity are appropriated from Augustine's *De trinitate (On the Trinity)*. Likewise, Anselm's analysis of free choice in terms of the distinction between having an ability and exercising it, together with his reasoning about the impossibility of an upright human will's being overpowered by the force of temptation, harks back to Augustine. Yet, Anselm is no mere reiterator of Augustine's points. Just as his *Proslogion* argument advances well beyond any cognate systematic reasoning found in Augustine, so his theory of atonement lays a foundation different from Augustine's Devil-ransom theory, though a summary of that theory is incorporated into the *Cur deus homo*. Likewise, his definition of free choice has no parallel in Augustine's writings, even though his concept of 'free choice' is allied with that of Augustine.

3 Philosophical works: *Monologion*

The *Monologion* and the *Proslogion* should be studied together, since each in certain respects elucidates the other.

Anselm himself never thought of the *Proslogion* as replacing the *Monologion*. Although the more creditable (and traditional) view maintains that chapters 1-4 of the *Monologion* aim at proving the existence of God, this view has been challenged by F.S. Schmitt and others. Schmitt (1969) regards Anselm as striving to demonstrate something not about the existence of God but about God's essence: Anselm does not undertake to show that a Supreme Being exists as the cause of the universe, but endeavours instead to prove that the cause of the universe, a cause that is presupposed to exist, is a supreme being (*Analecta Anselmiana* vol. I: 45). Furthermore, Schmitt contends that in these chapters Anselm self-consciously deplatonizes Augustine, from whose *De trinitate* 8.3 he is borrowing. Anselm, he says, leaves aside three Neoplatonistic tenets found in Augustine's discussion: (1) that the concept of the good is impressed (by God) upon the human mind; (2) that the mind beholds both good things and the Good itself; and (3) that good things participate in the Good itself. Critics of Schmitt, however, question whether Anselm is actually borrowing from *De trinitate* 8.3 anything more than Augustine's topic; and if he is not borrowing, then he cannot be said to be deliberately leaving some particular doctrines aside (see Augustinianism).

There is a clear strand of Neoplatonism that runs throughout the *Monologion*. In *Monologion* 9 Anselm teaches the doctrine of exemplarism, although he goes on to maintain that there is only a single Form, or Exemplar, of creation: namely, the second member of the Trinity, or the Eternal Word of God (*Monologion* 30-3). He also accepts a doctrine of degrees of existing, whereby a plant exists more than does a stone, whereas a horse exists more than does a plant (*Monologion* 31). Moreover, he implies that existence is a perfection:

> No one doubts that created substances exist in themselves very differently from the way they exist in our knowledge. For in themselves they exist in virtue of their own being; but in our knowledge their likenesses exist, not their own being. It follows, then, that the more truly they exist anywhere by virtue of their own being than by virtue of their likenesses, the more truly they exist in themselves than in our knowledge.
>
> (*Monologion* 36)

Since Anselm correlates existing truly with existing greatly (*Monologion* 31; *Proslogion* 3), he regards something as existing more greatly (in other words, more perfectly) if it exists 'in its own being' in addition to existing in someone's knowledge. In contrast to the Neoplatonists, however, Anselm holds to a doctrine of analogy on the basis of which some of our predicative discourse about God bears some real but very remote likeness to the Divine Nature (*Monologion* 65; *Responsio* 8). He links our conceiving of God with our conceiving of ourselves:

> The mind, then, can very fittingly be called its own mirror, as it were, in which it beholds, so to speak, the image of this Being which it cannot see face to face. For if of all created things the mind alone can remember itself, understand, and love, then I do not see why we should deny that there is in it the true image of this Being, which exists as an ineffable trinity of self-remembrance, understanding and love.
>
> (*Monologion* 67)

Speaking more generally, Anselm states that 'every being in the degree to which it exists is in that degree similar to the Supreme Being' (*Monologion* 66). These resemblances, though very distant, serve as the foundation for analogical predications (see Existence; God, concepts of; Trinity).

4 Philosophical works: *Proslogion*

No portion of Anselm's literary corpus has evoked as much controversy as has his *Proslogion*. Interpretation of this 'pious breathing', as one translator calls it, is beset by a maze of criss-crossing textual and conceptual problems. Textually, a number of questions are raised. Does Anselm here aim to set forth a proof or proofs of God's existence, and if so, in what chapter(s) is the proof located? Does Anselm's use of the description *id quo maius cogitari nequit* and its variants differ from his use of the description *aliquid quo nihil maius cogitari potest* and its variants; are these really descriptions, or are they definitions? If they are descriptions, are they interchangeable with the description 'greatest conceivable being'? What is meant by *maius*, by *cogitari*, by *intellectus*? If *cogitari posse* means 'to be conceivable', can it be equivalently replaced by 'to be logically possible'? In the opening sentence of *Proslogion* 2, is Anselm asking to be granted to understand *quia es sicut credimus*, or *quia es, sicut credimus*? Does *Proslogion* 2 presuppose that existence is a perfection (an attribute or a property)? In *Proslogion* 4, what is the proper English rendering of *Qui ergo intelligit sic esse deum*? When Anselm writes in *Proslogion* 15,*es quiddam maius quam cogitari possit*, is he claiming that God is inconceivable?

Such textual problems cannot be resolved simply by re-examining the Latin passages, for the proper construal of the respective texts requires the elimination of ambiguities. Invariably, all such translations will be interpretative. Some translators, for example, construe the opening sentence of *Proslogion* 2 as Anselm's request to be granted to understand 'that You exist, even as we believe [You to exist]', so that *sicut credimus* is parenthetical. Others have taken *sicut* to mean 'in the manner that' and have dropped the editorial comma that precedes it, so that Anselm is seen as asking to understand 'that You exist in the manner that we believe [You to exist]'. According to this latter rendering, Anselm is not aiming to prove the existence of God; rather, he wants to show that God, whom he believes to exist, exists in a manner different from the mode of existence of all finite beings: that is, he exists so truly and eternally and immutably that he cannot even conceivably not exist. In comparison with this mode of existence, finite beings are as nothing. In this interpretation, first advanced by Stolz (1933) and subsequently repeated in modified form by many others, the *Proslogion* is primarily an exercise in mystical theology.

By contrast, Malcolm (1960) maintains that *Proslogion* 3 contains the elements of a second version of Anselm's argument, which Malcolm takes to be aiming at demonstration (as does also the first). This second version is supposed to be superior to the reasoning in Chapter 2, inasmuch as it does not require the dubious presupposition that mere existence is a perfection. Instead, it acceptably presupposes that necessary existence is more excellent than is contingent existence. Disagreeing with Malcolm and with almost everyone else, Anscombe (1985) views Anselm as proposing a decidedly different argument. She punctuates a key sentence in *Proslogion* 2 as *Si enim vel in solo intellectu est, potest cogitari esse et in re quod maius est*, and interprets this as: 'For if it [*quo nihil maius*] is only in the intellect, what is greater can be thought to be in reality as well.' Campbell, in turn, perceives Anselm as engaged in the analysis of a speech-act: Anselm's argument 'shows that if one speaks of something-than-which-a-greater-cannot-be-thought one is committed to asserting that such a thing exists' (Campbell 1976: 193-4), but nothing prevents an atheist from refusing to speak of something-than-which-a-greater-cannot-be-thought.

Even one of Anselm's earliest interpreters, Gaunilo, a monk from Marmoutier, had difficulty with Anselm's text. He misinterpreted Anselm to be saying that if *quo nihil maius* 'existed solely in the understanding, then whatever existed also in reality would be greater than it'. He also failed to see that his own counter-argument about an island that excelled in perfection above all other lands did not have a logical structure parallel to the structure of Anselm's argument. For he speaks of something than which no other actually existing land is more perfect; but Anselm speaks of something than which nothing conceivable is perfect. In other respects, Anselm himself also partly misapprehended Gaunilo's critique. He did not recognize that Gaunilo's phrase *maius omnibus* is shorthand for *illud maius omnibus quae cogitari possunt* and not for *illud maius omnibus quae sunt*. Moreover, he incorrectly accused Gaunilo of contradicting himself, an accusation resulting from a misreading of Gaunilo's words *non [posse] hoc aliter cogitare, nisi intelligendo, id est scientia comprehendo, re ipsa illud existere*. Anselm wrongly takes Gaunilo to be defining 'understanding *x*' as 'apprehending with certainty that *x* really exists', whereas Gaunilo is merely defining 'understanding' as 'apprehending with certainty'.

Going beyond the many textual issues, contemporary philosophers have also noted a variety of conceptual problems with the *Proslogion* 2 argument. First, does it confuse two different domains, *de dicto* and *de re*; that is, from something's inconceivable nonexistence, does it follow that that thing exists in reality? Second, does the argument beg the question by assuming that the existence of God is possible? Third, does it beg the question inasmuch as the proposition 'that than which a greater cannot be thought is not that than which a greater cannot be thought' is not self-contradictory unless the existence of that than which a greater cannot be thought is presupposed? This question involves a theory about the logic of definite descriptions: for example, 'the prime number between 3 and 5 is not between 3 and 5' is self-contradictory only if 'the prime number between 3 and 5 is between 3 and 5' is true; and it is true only if there is a prime number between 3 and 5.

Does the argument successfully establish the compossibility of the various perfections that it ascribes to *quo nihil maius*, and does it successfully demonstrate that *quo nihil maius* is indeed a unique being? Is the very concept of *quo nihil maius* intelligible, or is it like the concept of an integer than which none greater can be thought? Can a being that is maximally and absolutely perfect be intelligibly said to be comparatively greater than all existing things, things that are subject to degrees of perfection (greatness)? These and other questions have perpetuated continuing disagreement about just where and how Anselm's argument goes wrong. Among philosophers, the strong feeling that the argument is unsound has contributed to a tendency to regard the entire *Proslogion* as a

meditation on the majesty and greatness of God rather than as an attempted, and failed, set of proofs. However, the fact remains that Anselm, at the end of his reply to Gaunilo, spoke of himself as having engaged in proving:

> I have now showed, I believe, that in the aforementioned treatise I proved - not by inconclusive reasoning but by very compelling reasoning - that something than which a greater cannot be thought exists in reality…. For the signification of this utterance ['something than which a greater cannot be thought'] contains so much force that what is spoken of is, by the very fact that it is understood or thought, necessarily proved to exist in reality and to be whatever ought to be believed about the Divine Substance.
>
> (*Responsio* 10)

Anselm is not a mystic, as some have claimed him to be. Nor should his meditative reflections in the *Proslogion* misleadingly be called confessions, even though their style is reminiscent of Augustine's *Confessiones* (see God, arguments for the existence of).

5 Philosophical works: *De grammatico*

This dialogue reflects the emphasis at Bec on studying the trivium (dialectic, grammar and rhetoric, as opposed to the quadrivium: arithmetic, geometry, astronomy and music); moreover, it bears witness to the esteem in which Aristotle and his *Categories* were held within the School of Bec. The Latin word *grammatica* indicates not only the subject matter that we today call grammar but also the subject matter that we call literature. Anselm himself expresses a disaffection for teaching the former (*Epistola* 64). Contemporary interest in *De grammatico* is due largely to D.P. Henry (1964), who insightfully recognised it as a serious study in paronymy. Paronyms are words (such as *grammaticus*, meaning 'expert in grammar') that derive from other words from which they differ only in case ending (such as *grammatica*, meaning 'expertise in grammar') and that function as both adjectives and nouns (for example, we can say both that someone is expert in grammar and that someone is *an* expert in grammar). Accordingly, the title *De grammatico* is properly translated not as 'On the Grammarian' but as 'On (an) Expert in Grammar', where the parentheses around the indefinite article 'an' serve to signal that it is operative in English when 'expert in grammar' functions as a noun, but is dispensed with when 'expert in grammar' functions as an adjective. (Latin has neither a definite nor an indefinite article.)

In this light, the central question raised within the dialogue is *utrum grammaticus sit substantia an qualitas* (whether (an) expert-in-grammar is a substance or a quality)? Aristotle and medieval textbooks cited grammaticus as an example of quality because the word itself signifies a quality (namely, *grammatica*). However, in the work, Anselm's fictional interlocutor, the Student, points out that in customary parlance *grammaticus* is spoken of as a substance and not as either a quality or an accident. Anselm resolves the question by showing the Student that *grammaticus* signifies both a quality and a substance, for it signifies both expertise in grammar and man, in different ways. Principally and *per se* and substantially it signifies expertise in grammar; and because expertise in grammar is a quality, being expert in grammar is also a quality. Improperly and *per aliud* and accidentally it signifies man; and because man is a substance, being an expert in grammar is also a substance.

Anselm understands a word to have signification insofar as that word calls something to mind. 'Expert in grammar' calls to mind both expertise in grammar and man, though it does so in different ways. A word which signifies *per aliud* (that is, which does not in and of itself call something to mind but instead calls that thing to mind on the basis of something else and accidentally) is said by Anselm to be appellative of the thing that is thus signified *per aliud*. At this point Anselm tightens his terminology, reserving the word 'signifying' for properly signifying, that is, signifying *per se*: 'expert in grammar' signifies, but is not appellative of, expertise in grammar, while it is appellative of, but does not signify, man. Indeed, only man is called (an) expert in grammar because only man has the accident (the quality) of expertise in grammar. A term is appellative of a thing, says Anselm, 'if this thing is called by this name in the customary course of speaking'. Names signify things, not concepts (though there might be second-order names, which signify other names).

In interpreting *De grammatico*, we must beware of two traps: first, that of supposing that *significatio per se* has to do exclusively with meaning and that *significatio per aliud* (that is, *appellatio*) has to do exclusively with reference; and second, that of supposing that Anselm considers *grammaticus est grammatica* to state a logical truth (Henry 1974: 183). With regard to the first misconception, Anselm regards a speaker as at times able to refer to an object either by using the word that *per se* signifies that object, or by using a word that is an appellative of that

object. In a proffered example, he notes that someone might refer to a horse by using the word ‘horse’, which *per se* signifies a horse, that is, which in and of itself calls (the thought of) a horse to mind. Or he might refer to a horse by using the appellative *albus* (‘the white one’), in a situation where a white horse is standing next to a black ox. The hearer would know - not purely on the basis of the signification of the word ‘white’, but also and additionally on the basis of his knowledge that of the two animals, only the horse is white - that the horse was being referred to. Concerning the second misconception, neither Anselm nor the Student regards the phrase *grammaticus est grammatica* as stating a logical truth (while trespassing against *usus loquendi* (ordinary usage)). Rather, both agree that *grammaticus* signifies *grammatica* because it signifies *sciens grammaticam* (having expertise in grammar). Since *grammaticus* is an accident only of man, we say *grammaticus est sciens grammaticam*, rather than saying *grammaticus est grammatica*. This latter sentence is no more a logical truth than it is meaningful. By contrast, the former sentence (*grammaticus est sciens grammaticam*) has a double meaning which results from the fact that *grammaticus* is a paronym: ‘being (an) expert in grammar is having expertise in grammar’.

The real importance of *De grammatico* for Anselm lay in its pedagogical usage as an exercise in dialectic. Its contemporary importance lies in the fact that it attests to Anselm’s awareness of the need to be clear about the elusive relationship between signifier and signified; and it witnesses, further, to his desire to do so by recourse to *rationes necessariae* (*De grammatico* 1) (see Language, medieval philosophy of; Language, philosophy of).

6 Philosophical works: *De veritate, De libertate arbitrii, De casu diaboli*

These three dialogues centre around the notion of *rectitudo* (rectitude, rightness, uprightness). ‘Truth’, says Anselm, is definable as ‘rectitude perceptible to the mind alone’. Justice is rectitude kept for its own sake, and freedom is, also by definition, rectitude of will kept for its own sake. In eliciting his definition of ‘truth’, Anselm examines truth insofar as it is found in statements, thoughts, acts of will, actions, the senses and in the very being of things. A statement is true when it signifies what it ought to, that is, when it signifies correctly; and it signifies correctly when it either signifies to be the case that which actually is the case, or signifies not to be the case that which really is not the case. Thus, a statement’s truth is its rightness, correctness or rectitude.

However, a statement does not always do what it is designed to do (namely, signify correctly what is, or is not, the case), for the statement is also capable of being used to signify falsely (that is, to signify that what-is is not, or that what-is-not is). Even when the statement signifies falsely, it retains the capability to signify truly, because it remains a meaningful set of words. Indeed, such a statement never loses its capability to be used to signify truly and correctly. Insofar as the statement retains this capability, we may also say of it that it is as it ought to be, that it is correct and has correctness, or rightness, or truth.

Thus, reasons Anselm, a true statement has two truths: the truth that accords with its signifying what it is designed to signify, and the truth that accords with its being capable of signifying what it is designed to signify. This latter truth belongs to the statement naturally, inasmuch as it is retained even when the statement signifies otherwise than it is designed to (that is, even when it signifies that what-is is not or signifies that what-is-not is). The former truth belongs to the statement accidentally and only at such time as the statement signifies a correct state of affairs. Anselm follows Aristotle in regarding the statement ‘Socrates is sitting’ as true so long as Socrates is seated but as becoming false when Socrates stands up.

Anselm goes on to point out that the foregoing distinction between two truths applies to thoughts, acts of will, actions, the senses and the very being of things insofar as they all both do what they ought to do and are capable of doing what they ought to do, whether they actually succeed or not. He develops a sense in which thoughts, acts of will and so on may be said to signify, in a twofold way. For example, truth (which is a form of rightness) is said to be in the being of things when these things are as they ought to be (that is, when they conform to what God designed for things of their kind to be); in another sense they ‘signify’ by their very existence that what they are is what they ought to be, whether or not they are defective specimens. For example, a misbegotten animal is not what it ought to be, as measured by the perfection of its species; but it is what it ought to be insofar as it is an existent thing (because otherwise God would not have allowed it to be).

Since a natural rightness belongs to statements, thoughts, acts of will and so on (even when they do not do what they are designed to do, or are not what they are designed to be), this rightness through which they are right

continues to exist when the different statements, thoughts, beings and so on signify falsely. Indeed, this rightness accords with a Rightness that is one and the same in them all, and that continues to exist even when the things themselves and their natural rightness perish. Anselm (borrowing from his own *Monologion* 18) infers that this Rightness, which is perceptible by the mind alone, is eternal. The statement 'something was going to exist' was always true in the past, and the statement 'something has existed' will always remain true in the future; and since each of them can be true only if there is truth, truth is eternal. Like Augustine in *De libero arbitrio (On Free Choice of the Will)*, and like Scripture itself in John 14: 6, Anselm identifies Eternal Truth with God.

In *De libertate arbitrii (Freedom of Choice)*, Anselm searches for a definition of 'free choice' that will elucidate the essential freedom of God, unfallen angels, fallen angels, pre-fallen Adam, post-fallen Adam, Adam's earthly descendants and redeemed Adamic human beings in their sanctified, heavenly state. He concludes that 'freedom of choice' is unexceptionably definable as 'the ability to keep uprightness-of-will for its own sake', an ability which every rational being always possesses. This definition has both philosophical and theological aspects. Philosophically, the definition is meant to exclude the view that having freedom of choice consists essentially in having the power of alternative choice: the ability to choose either that which is morally right or that which is morally wrong. Neither God, the good angels, nor human beings in the heavenly state have this power; and yet Anselm considers them all to have free will. Even regarding cases where agents do have the power of alternative choice, their freedom does not consist therein. For example, when Satan and Adam first sinned (although they were under no necessity to do so), each sinned 'by his own choice, which was free'; but neither did so 'by means of that in virtue of which his choice was free', the ability to maintain a righteous will. Instead, each used another ability, namely, the ability to abandon uprightness of will. Anselm's distinction between having an ability and using that ability - a distinction appropriated from Augustine - allows him to assert, paradoxically, that evil acts of will and evil actions are done freely even though they are not done by means of that ability whose possession is essential to freedom (see Free will; Freedom, divine).

In further expounding his theory of freedom, Anselm encounters a second paradox. He distinguishes ability not only from use but also from motivation; in other words, he distinguishes being *able* to will from being *motivated* to will. However, in some contexts he proceeds to talk as if certain intense motivations were so disenabling that they deprived one's will of freedom:

> If the faithful were immediately transformed at baptism or at martyrdom into the state of incorruption, then merit would perish and men would be saved without merit…. For since men would see those who would be converted to Christ pass over immediately into the state of incorruptibility, there would be no one who would be able even to will to turn away from this very great happiness which he would behold.
>
> (*De concordia* III, 9)

This point of view is reinforced by Anselm's notion that in the future life, redeemed human beings will be like the good angels: they will be unable to sin because they will no longer see anything more to will than that which they shall already have (*De casu diaboli* 6). Anselm also closely links motivation and ability/inability when he states that if Satan had known that he would actually be punished if he sinned, rather than knowing simply that he could deservedly be punished, then 'he would not have been able freely to will what would have caused him to be unhappy' (*De casu diaboli* 23). In other words, he would not have been able to sin. However, if certain patterns of intense motivation are disenabling, how is it plausible that the will of a rational creature is really always free?

On the more centrally theological plane, a third paradox arises. Although Anselm teaches that each human being always retains the ability to keep uprightness of will, he also teaches that no human being has the ability, by his own efforts, to regain uprightness of will once it has been abandoned. Only God can restore this uprightness; but God does so only with respect to those who repent. This doctrine leaves Anselm in the awkward position of maintaining that if someone's will lacks uprightness, then he cannot will uprightly, even though he is still free by virtue of his having the ability to keep uprightness of will if uprightness of will were restored to him. In having an ability that cannot be used, such a man is said by Anselm to resemble someone who has the power of sight but who cannot use this power because he is located in a totally darkened room; still, he could actually see if light were restored to the room. There is something strange about Anselm's calling someone's will free when it is not free actually to will uprightly. Recognizing this point, Anselm refers to a man as both a servant and free. This paradox reaches its most concise expression in *De concordia* III, 13: 'without justice the will is never free, because

without justice the natural freedom of choice is futile'.

A fourth paradox emerges in conjunction with the third. If one's will is no longer upright by virtue of one's having willed evilly, and if God restores uprightness only to the will of those who repent, how can one be willing to repent unless one's will is to some extent already upright prior to the restoration of uprightness? Anselm expresses this paradox in terms of conversion (though it applies, as well, after conversion): 'Those who say "Convert us, O God" are already to some extent converted, because in willing to be converted they have an upright will' (*De concordia* III, 6). By prevenient grace, maintains Anselm, God guides toward repentance those whom he has foreordained.

A fifth paradox surfaces when Anselm contends that the force of temptation can never overpower an upright will. The force of temptation, if it were to succeed, would have to compel an individual to accede; but, philosophizes Anselm, again following Augustine, no one can be constrained to will. A soldier, for example, can be tortured or even killed against his will; however, he cannot be made to will against his will, for anyone who wills consents to will, that is, wills willingly. Anselm construes 'being constrained to will' as 'being made to will unwillingly'; and this latter expression he regards as incoherent, on the grounds that if one were unwilling to will, then there would be no actual willing. However, a critic could contend that Anselm's analysis of 'constrained to will' is tendentious and oversimplified.

A sixth paradox has to do with Anselm's view that Satan's will to persevere in justice both failed him and did not fail him. It failed him because, although he was created with a preponderant, supernatural inclination-for-justice, he nonetheless willed unjustly. On the other hand, it did not fail him because the supernatural inclination for justice, with which he was created, did not wane. In attempting to dissolve the paradox of how Satan, who was created with a strong inclination for justice and who was placed in an environment with reinforcing incentives, would have been motivated to will evilly, Anselm introduces a 'Scholastic-like' distinction: it is not the case that Satan's willingness to desert justice was caused by an antecedent waning of the willingness to keep justice but, rather, the willingness to desert caused the not-willingness to keep. Satan willed to desert justice in order to secure a desired benefit that it was unjust for him to have at that time. The deeper paradox now becomes one of why Satan, a rational creature, would irrationally and knowingly choose to have a benefit the choosing of which would risk the loss of all happiness? Anselm's answer, 'only because he willed to', transforms the paradox into a mystery.

A final paradox relates to Anselm's statement that:

> God causes all the things which are done by a just or an unjust will, viz., all good and evil deeds. Indeed, in the case of good deeds he causes what they are [essentially] and the fact that they are good; but in the case of evil deeds he causes what they are [essentially] but not the fact that they are evil.
>
> (*De concordia* I, 7)

These paradoxes Anselm himself regards as only apparent. Yet, whatever be one's own final appraisal of Anselm's theory of freedom, one must bear in mind that Anselm is a determinist and a compatibilist: only Satan's initial choice of evil was done simply because Satan willed thus to choose. All other reflective choices are such that they are 'caused' by factors that, in principle, are subject to investigation and description (and that do not deprive the agent of free choice):

> Even as every will wills something, so it also wills for the sake of something. And just as we must consider what it wills, so we must also notice why it wills. For a will ought to be upright in willing what it ought and, no less, in willing for the reason it ought. Therefore, every will has both a what and a why. Indeed, whatsoever we will, we will for a reason.
>
> (*De veritate* 12)

Having in *De veritate (On Truth)* defined 'justice' as 'uprightness of will kept for its own sake', and having indicated that he means 'kept for its own sake only', Anselm in *De casu diaboli (The Fall of the Devil)* interprets the evil of injustice to be the absence of justice from a will in which justice ought to be present. Accordingly, injustice is a privation; and a privation, he thinks, is a kind of not-being. However, if the evil that is injustice is a kind of not-being, how can the word 'evil' be significative, wonders the Student interlocutor. The Teacher,

Anselm, gives three replies. First, ‘evil’, ‘injustice’ and ‘nothing’ signify, respectively, a removal of good, justice and something. Since a removal can be signified only by also signifying that which is to be removed, expressions such as ‘not good’, ‘not just’ and ‘not something’ obliquely signify good, just and something, without signifying them by positing them. Second, ‘evil’ and ‘injustice’ do not signify anything *secundum rem* (according to fact) but they are significative *secundum formam* (according to linguistic form), for we use these terms to speak of evil and injustice as if these latter were something - as when we say ‘evil caused it’ or ‘injustice caused it’. Third, ‘evil’ is sometimes used to signify *incommodum* (detriment) rather than to signify injustice or an absence; in this respect it signifies something and not merely as-if-something (*quasi aliquid*).

In *De casu diaboli*, Anselm seeks to remind us that ‘we ought not to cling to the verbal impropriety concealing the truth as much as we ought to attend to the true propriety hidden beneath the many types of expression’. In the process of heeding his own injunction, he there appeals to many of the same distinctions that are also found in his *Philosophical Fragments*.

7 Theological works: *De incarnatione Verbi* and *De processione Spiritus Sancti*

De incarnatione Verbi (The Incarnation of the Word) contains Anselm’s defence of the doctrine of God’s triunity. This defence is mounted against Roscelin of Compiègne, a French cleric who maintained that if the three persons of God were only one thing and not three separate things, then the incarnation of the Son would, untowardly, have necessitated the incarnation of the Father and the Holy Spirit as well. Anselm examines the meaning of ‘thing’ (*res*) and explains that the three persons are three distinct (but not separate) things with respect to their distinguishing properties, but are one thing with respect to the nature that they have in common. Exhibiting masterly skill as a dialectician, he contends that Roscelin’s view leads either to tritheism or to Sabellianism, both of which doctrines are objectionable to Roscelin himself. He further contends that Roscelin’s own articulation of his own claim is such that it entails the very same untoward consequence from which Roscelin is attempting to escape: namely, the incarnation of the Father and the Holy Spirit along with that of the Son. After advancing an argument to show that there can be no more than one God, Anselm explains why this one God became incarnate in the person of the Son rather than in the person of the Father or of the Holy Spirit. To complete his dialectical strategy, he provides a symbolic illustration to lend credence to the very notion of triunity: the Nile, while being one body of water, is also a three-ness of spring, river and lake.

The divine trinity and oneness is explored more fully in *De processione Spiritus Sancti (The Procession of the Holy Spirit)*, where the Augustinian emphasis upon *relatio* looms larger. The three persons of God are three relations, three ways in which the one Divine Nature relates itself to itself. These relations are irreducible, inasmuch as the Father would not be a father unless he had a son, but the Father himself cannot be his own son; the Son would not be a son unless he had a father, but the Son himself cannot be his own father; and the Holy Spirit would not be a common spirit unless he proceeded from both the Father and the Son, but he himself cannot be either of the two from whom he proceeds. In line with the Nicene-Constantinople creed, Anselm defends the *filioque* doctrine against the Greek Orthodox teaching that the Holy Spirit proceeds from the Father alone. No other medieval treatises so concisely, clearly and vigorously display the rationale of orthodox trinitarianism as do these two Anselmian works (see Trinity).

8 Theological works: *Cur deus homo* and *De conceptu virginali*

Desirous to explain the reasons for the Incarnation, Anselm undertakes in the *Cur deus homo* an elaborate demonstration of his view that only by means of incarnation could God have made provision for human salvation. Adam’s sinful fall, as well as the ensuing sins of all his natural descendants, could not simply be overlooked by God, since doing so would do violence to God’s justice. Hence, every sinner is under obligation to make payment for his sins, sins which rob God of honour by detracting from the splendour of creatures and therefore from God’s own accomplishment as Creator. Payment must involve both restitution of what has been stolen and compensation for the injury done. Now, every rational creature, even if sinless, owes to the Creator perfect and voluntary obedience - indeed, owes itself and all that it is. A sinner, who has stolen honour from God by stealing from God the obedience due to him, is obliged to resume rendering the requisite obedience and, in addition to make compensation, or satisfaction, for the perpetrated wrong. In this twofold way the sinner would fully restore God’s honour.

However, once having sinned, the sinner's will is deprived of uprightness, which by its own efforts it cannot recover; and hence no sinner can attain perfect obedience. Moreover, the sinner has nothing with which to compensate God. Compensation must be equal to the gravity of the wrong that was done; but any disobedience to God's command is so grave, teaches Anselm, that it ought not to be done even if one could thereby save an infinite number of worlds from perishing. Since the sinner is obliged to offer as satisfaction, or compensation, something greater than is that for whose sake he is obliged not to dishonour God, and given that he is not to dishonour God even in order to save an infinite number of worlds from perishing, he must render to God something of greater value than are an infinite number of worlds. But only God can make such a payment, whereas only a human being of Adam's race ought to. Hence, if payment is to be made, it must be made by a God-man.

Yet, queries Anselm, what payment could a God-man make in addition to perfect and voluntary obedience? What is it that he would not already owe to God and that would count as satisfaction? The God-man, reasons Anselm, would make satisfaction by choosing righteousness in preference to life. Being sinless, and in this respect unlike all other human beings, he alone would not be under the penalty-of-death, which resulted from the Fall. He would yield up his life to the honour of God by allowing himself to be put to death for righteousness' sake - that is, to be put to death for refusing, when accused of blasphemy, to profess the untruth that he was not God. Since the evil of sinning against the person of God is the greatest conceivable evil, the goodness of the God-man's life must be the greatest conceivable goodness. Thus in choosing righteousness even in the face of death, the God-man restored honour to God by rendering a service more valuable than the value of the totality of things that are not God. Such a service deserves to be rewarded. And because the God-man needs nothing, he may admissibly transfer this reward to cancel the debt incurred by Adam and his natural descendants (see Atonement; Salvation; Sin).

In the course of his argument, Anselm explains once again why it was most fitting for the Son of God and not for either of the other two members of the Trinity to become incarnate. He hastens to point out that those who actually put to death the Jesus of history were guilty of only a venial sin, having acted in ignorance of his Messianic identity. In *De conceptu virginali et originali peccato (The Virgin Conception and Original Sin)*, he distinguishes between Adam's person and his nature. When Adam sinned personally, his sinful person contaminated his nature. As a result, his descendants are born with an individuated Adamic nature whose will lacks justice. This unjust nature contaminates their persons, predisposing them to sin personally when they reach the age of accountability. Anselm offers an explanation of how Jesus, who was of Adam's nature, was nonetheless able to remain free of original sin - that is, remain free of contracting the necessity-of-sinning upon attaining the age of reason. He insists that Adam's descendants are not condemned for Adam's sin but only for their own, even though Adam's sin is a cause of their own fallen nature. Anselm does not teach the doctrine of Mary's own immaculate conception (see Incarnation and Christology).

9 Theological works: *De concordia*

Oriented around the topics of grace, foreknowledge and predestination, *De concordia praescientiae et praedestinationis et gratiae dei cum libero arbitrio (The Harmony of the Foreknowledge, the Predestination and the Grace of God with Free Choice)* not only extends the views previously advanced in *De libertate arbitrii* and *De casu diaboli* but also places them squarely within a theological context. Predestination is a theological doctrine that relates primarily to the attendant doctrine of salvation. The New Testament seems to teach that some individuals are foreordained to salvation, whereas others are not. Anselm follows Augustine both in accepting this doctrine and in acknowledging that he has no explanation for why God singles out some and not others. As early as *Proslogion* 11 he prayed: 'But if we can somehow grasp why You can will to save those who are evil, surely we cannot at all comprehend why from among those who are similarly evil You save some and not others because of Your supreme goodness, and condemn some and not others because of Your supreme justice.' Yet predestination and enabling grace do not violate human freedom, believes Anselm, because inducing someone's assent and trust is not identical with compelling assent and trust.

Three considerations reassure Anselm that divine foreknowledge, like predestination, is not incompatible with human free will. First of all, God foreknows not only what a given individual will do but knows also *how* the individual will do it, whether freely or by necessity. Assume that the individual will act freely: then, if it is necessary that what-God-foreknows come to pass, it is necessary that the individual do freely what will be done. This necessity which guarantees one's freedom cannot at the same time be a necessity that deprives one of

freedom. Anselm believes that the expression ‘it is necessary that… ’ is misleading because it tends to suggest that the event in question happens by necessity, whereas in the present context it means only ‘it is certain that… ’. Second, something may be certain to occur either because God efficaciously wills that it occur, or because he foreknowingly wills to permit its occurrence. In the latter case, his foreknowledge does not efficiently cause the action or the event to happen. In fact, Anselm reminds us as early as *De casu diaboli* 21, God is improperly said to foreknow the future, since his eternal knowledge is knowledge of things as present. The present knowledge of something’s happening does not necessarily make it happen. Third, God’s will must be (conceived of as) free, because otherwise God could be thought to be more perfect - something which is impossible. By the same token, he must be regarded as knowing his own will. If his knowledge of his own will does not deprive it of freedom, then *prima facie* there is no reason to infer that his knowledge of the human will deprives it of freedom (see Eternity; Free will; Grace; Omniscience; Predestination; Salvation).

10 Conclusion

Anselm’s paramount publications, though only eleven in number, have had a significant (though never major) impact upon the history of Western philosophy. Peter Abelard, Thomas Aquinas, John Duns Scotus, William of Ockham, Nicholas of Cusa and others found it helpful to quote from them, sometimes approvingly, sometimes disapprovingly. Anselm’s learned command of Aristotle’s *logica vetus*, his insightful appeal to the Latin community’s *usus loquendi* and his bold utilization of the method of *sola ratione* bear ample witness to his gifted philosophical mind. Yet, like any good philosopher, he knew when to be tentative, as evidenced by his conclusion to *De conceptu virginali*:

> In accordance with the capacity of my understanding I have briefly made these statements about original sin - not so much by way of asserting them as by way of provisionally inferring them - until God shall somehow reveal to me something better. But if someone has a different view, I do not reject anyone’s opinion provided it can be proved to be true.
>
> (*De conceptu virginali* 29)

In spite of his emphasis upon *rationes necessariae*, he sensed a danger in trusting bloated, over-confident and self-confident reason. Consequently, he was not averse to declaring with respect to deep theological mysteries: ‘if someone thinks he knows something, he does not yet know it as he ought to know it’ (*De incarnatione Verbi* 1). Because he regarded such knowledge and understanding as a grace, he was willing to continue to believe - in the hope of one day better comprehending.

JASPER HOPKINS

List of works

Anselm of Canterbury (1033-1109) *S. Anselmi Opera Omnia (Complete Works of Saint Anselm)*, ed. F.S. Schmitt, Stuttgart: Frommann.(This edition is a reprint, consisting of six volumes in two tomes, of Schmitt’s earlier edition of Anselm’s works, published by Thomas Nelson.)

Anselm of Canterbury (1033-1109) Philosophical Fragments, ed. F.S. Schmitt, *Ein neues unvollendetes Werk des hl. Anselm von Canterbury*, Beiträge zur Geschichte der Philosophie und Theologie des Mittelalters 33. 3, 1936; ed. R.W. Southern and F.S. Schmitt, *Memorials of St. Anselm*, London: British Academy, 1969. (Southern and Schmitt includes the philosophical fragments as well as the compilations *Dicta Anselmi* and *De morum qualitate per exemplorum coaptationem*.)

Anselm of Canterbury (1033-1109) *Fragmenta Philosophica (Philosophical Fragments)*, trans. J. Hopkins and H. Richardson, *Anselm of Canterbury*, vol. 2, New York: Mellen, 1976.(A translation of philosophical fragments.)

Anselm of Canterbury (1070-1109) *Epistolae (Letters)*, trans. W. Fröhlich, *The Letters of Saint Anselm of Canterbury*, Kalamazoo, MI: Cistercian Publications, 1990-4, 3 vols.(Anselm’s collected letters in translation.)

Anselm of Canterbury (1072-1103) *Orationes sive meditationes (Prayers and Meditations)*, trans. B. Ward, *The Prayers and Meditations of Saint Anselm*, Baltimore, MD: Penguin, 1973.(Collected theological writings.)

Anselm of Canterbury (1076) *Monologion*, trans. J. Hopkins, *A New Interpretive Translation of St. Anselm’s*

Monologion and Proslogion, Minneapolis: Banning, 1986.(Anselm's first major philosophical work, showing the influence of Neoplatonism.)

Anselm of Canterbury (1077-8) *Proslogion*, trans. J. Hopkins, *A New Interpretive Translation of St. Anselm's Monologion and Proslogion*, Minneapolis: Banning, 1986.(Includes Gaunilo's *Pro insipiente (On Behalf of the Fool)* and Anselm's *Responsio (Reply to Gaunilo)*.)

Anselm of Canterbury (*c.*1080-5?) *De grammatico*, trans. J. Hopkins and H. Richardson, *Anselm of Canterbury*, vol. 2, New York: Mellen, 1976.(Grammatical work, notable for its emphasis on signification.)

Anselm of Canterbury (*c.*1080-5) *De veritate (On Truth)*, trans. J. Hopkins and H. Richardson, *Anselm of Canterbury*, vol. 2, New York: Mellen, 1976.(Contains Anselm's definition of truth, identifying eternal truth with God.)

Anselm of Canterbury (*c.*1080-5) *De libertate arbitrii (Freedom of Choice)*, trans. J. Hopkins and H. Richardson, *Anselm of Canterbury*, vol. 2, New York: Mellen, 1976.(Searches for a definition of 'free choice'.)

Anselm of Canterbury (*c.*1085-90) *De casu diaboli (The Fall of the Devil)*, trans. J. Hopkins and H. Richardson, *Anselm of Canterbury*, vol. 2, New York: Mellen, 1976.(Anselm's work on the relationship between sin and free will.)

Anselm of Canterbury (1092-4) *De incarnatione Verbi (The Incarnation of the Word)*, trans. J. Hopkins and H. Richardson, *Anselm of Canterbury*, vol. 3, New York: Mellen, 1976.(Anselm's defence of the doctrine of God's triunity.)

Anselm of Canterbury (completed 1098) *Cur deus homo (Why God Became a Man)*, trans. J. Hopkins and H. Richardson, *Anselm of Canterbury*, vol. 3, New York: Mellen, 1976.(Demonstrates Anselm's view that only through incarnation could God have made provision for human salvation.)

Anselm of Canterbury (1099-1100) *De conceptu virginali et originali peccato (The Virgin Conception and Original Sin)*, trans. J. Hopkins and H. Richardson, *Anselm of Canterbury*, vol. 3, New York: Mellen, 1976. (Discussion of the nature of sin, including original sin.)

Anselm of Canterbury (1102) *De processione Spiritus Sancti (The Procession of the Holy Spirit)*, trans. J. Hopkins and H. Richardson, *Anselm of Canterbury*, vol. 3, New York: Mellen, 1976.(A further exploration of Trinity and oneness, showing Augustinian influences.)

Anselm of Canterbury (1106-7) *Epistolae de sacramentis (Letters on the Sacraments)*, trans. J. Hopkins and H. Richardson, *Anselm of Canterbury*, vol. 3, New York: Mellen, 1976.(Anselm's views on the sacraments.)

Anselm of Canterbury (1107-8) *De concordia praescientiae et praedestinationis et gratiae dei cum libero arbitrio (The Harmony of the Foreknowledge, the Predestination and the Grace of God with Free Choice)*, trans. J. Hopkins and H. Richardson, *Anselm of Canterbury*, vol. 3, New York: Mellen, 1976.(Expands the views previously advanced in *De libertate arbitrii* and *De casu diaboli*.)

Anthropology, philosophy of

Anthropology, like philosophy, is multifaceted. It studies humans' physical, social, cultural and linguistic development, as well as their material culture, from prehistoric times up to the present, in all parts of the world. Some anthropological sub-fields have strong ties with the physical and biological sciences; others identify more closely with the social sciences or humanities. Within cultural and social anthropology differing theoretical approaches disagree about whether anthropology can be a science. The question of how it is possible to understand cultures different from one's own, and to transmit that knowledge to others is central to anthropology because its answer determines the nature of the discipline. Philosophy of anthropology examines the definitions of basic anthropological concepts, the objectivity of anthropological claims and the nature of anthropological confirmation and explanation. It also examines the problems in value theory that arise when anthropologists confront cultures that do not share their own society's standards.

1 Epistemological problems

Despite a shared commitment to fieldwork and to the role of anthropologists as participant-observers, different theoretical schools of anthropology disagree sharply about how it all works, and in particular about whether anthropology is or can be a science. According to one prominent school - cognitive anthropology - culture consists of a set of rules in the minds of its members (Frake 1969). To understand another culture, anthropologists must internalize those rules well enough to respond to new situations in a culturally appropriate way. In its approach to cultural behaviour as rule-governed, and in its broad interpretation of rules, cognitive anthropology accords with Winch's (1958) Wittgensteinian account of the nature of human social life (see Social norms). Winch, however, does not share cognitive anthropology's view that anthropology is a science. Linguistic rules - primary examples of cultural rules - offer an entry into the rest of the culture. To begin to learn a new set of cultural rules, cognitive anthropologists question informants about how they would classify various observable phenomena. The point is not merely to discover the names that others give to the objects and categories familiar to the anthropologist, but to grasp the other culture's own, possibly different, way of structuring the stream of experience into categories. To this end, cognitive anthropologists - who are also called 'ethnoscientists' - elicit indigenous classifications of features of the natural world (for example, colours, birds, fish, plants). They test their grasp of the rules by observing whether their own efforts at extending classifications gain the approval of their informants. When the anthropologists have mastered the new system, they compare and contrast it with their own (Western, scientific) system. The results of such investigations are usually put forth as evidence against radical forms of cognitive relativism (see Social relativism §3; Relativism).

Cognitive anthropology offers a clear answer to the first part of the central question raised above: one comes to understand another culture by becoming proficient in its rules through interaction with members of the culture. How that knowledge is transmitted to those not initiated into the culture remains problematic, however, for it is not clear that one system of rules can be translated into another. Although cognitive anthropologists view themselves as engaging in scientific studies of culture, and are concerned with the objectivity and predictive success of their claims, their account of the nature of cultural knowledge and how it is acquired works against its dispersal in the usual scientific channels, such as journal articles.

An opposing approach, symbolic anthropology, maintains that anthropology is ethnography. The business of anthropology is to write accounts of human culture that can be read, analysed, discussed and challenged by students and peers, now and in the future. Doing anthropology does not require one to internalize some set of rules, as cognitive anthropologists suppose, but instead to figure out what people are up to when they say and do certain things. Culture is not a set of rules located in anyone's mind, it is symbolic behaviour. Culture is thus a 'public document' that anthropologists are trained to 'read', just as literary critics read (interpret) poems and novels.

Comparing anthropology with literary interpretation highlights the issue of objectivity. Do standards exist for 'correct' interpretations of cultures or do anthropologists have the same latitude as literary critics to offer alternative, and perhaps incompatible, accounts? Geertz (1975), borrowing Ryle's terminology, notes that ethnography at its most basic level involves 'thick descriptions' rather than the reporting of 'raw' data. That is to say, any description of human behaviour (as opposed to mere bodily movement) imputes an intention to it, and

thus, at least partially, explains the behaviour. Collingwood in *The Idea of History* (1946) had already stressed the same point, using it to argue for a fundamental difference between interpretive explanations of human behaviour and causal explanations of 'mere' physical events (see Collingwood, R.G.). Nevertheless, he insisted that hypotheses about intentional descriptions could be subjected to rigorous examination, and accepted or rejected objectively, on the basis of evidence. Latter-day interpretivists, however, regard the impossibility of peeling away all layers of interpretation to get at 'the fact of the matter' as support for relativism (see Social science, contemporary philosophy of §3). One interpretation may be preferred to another because it is more coherent, richer, more subtle or relevant to contemporary concerns, but not because one is true and the other false. The latter terms are not applicable, at least in their usual sense, to interpretations. Because symbolic anthropologists emphasize the importance of interpretation over causal explanation and prediction, they see a significant gap between anthropology and science. While cognitive anthropology and symbolic anthropology are dominant theoretical approaches and loom large in philosophical discussions, many anthropologists, particularly those whose training was completed when earlier schools (for example, functionalism, historical particularism) flourished would not identify themselves with either school.

2 Ethical problems

Respect for the beliefs, practices and values of other cultures, no matter how different from one's own, is a hallmark of anthropological wisdom. Franz Boas (1940), whose name is inevitably linked with cultural relativism, rejected invidious comparisons between the 'high culture' of northern Europeans and the art forms, languages, myths and religious practices of indigenous Americans, just as he rejected 'progressive' evolutionary accounts, offered by physical anthropologists early in the twentieth century, that put the former at a more advanced stage of physical development than the latter. He insisted that the culture of each group should be studied in terms of its own historical development and appreciated in that context rather than judged by the standards of another culture.

Since moral beliefs and practices, like other beliefs and practices, depend on the cultural context, many anthropologists regard ethical relativism as an easy consequence of cultural relativism. Some moral philosophers have challenged this slide into relativism by claiming that while societies differ in their derivative moral judgments (for example, the propriety of cross-cousin marriage), they agree in their more fundamental moral judgments (for example, the immorality of incest). Whether universal agreement exists on any basic moral judgment is at least in part an empirical question - one to which Turnbull's studies of the Ik (1972) suggest a negative answer. A different attack on relativism maintains that establishing genuine relativism requires showing that people's basic ethical judgments would conflict even if they shared all the same factual beliefs and were fully enlightened as to the consequences of their views. On this view, the mere absence of universally accepted principles is not sufficient to prove relativism. By the same token, finding universally accepted moral principles would not disprove their dependence on particular cultures. The agreement could be accidental.

Despite such philosophical attacks on ethical relativism, most practising anthropologists continue to embrace it, for they equate ethical relativism with tolerance for the moral codes of others. Teachers of anthropology present relativism as the received view, usually also admonishing students to distinguish objective factual claims from subjective and relative value judgments. The student's ability to reserve judgment on the moral codes and practices of others is regarded as a prerequisite for anthropological fieldwork and for acceptance into the discipline.

Anthropologists' alleged commitment to relativism, however, is undermined by their own professional code of behaviour, as stated, for example, in the guidelines of the Society for Applied Anthropology (Bernard 1988). The dominant theme of these guidelines is Kantian: treat the people whom you study as ends not as means. Respect their right to self-determination, to arrange their lives as they see fit according to their standards. Anthropologists who are accused of violating this code must defend themselves satisfactorily or face professional sanctions.

Most field anthropologists believe that relativism permits or even requires them to defend 'their people' against interference from governments, missionaries, or other agents of so-called advanced civilizations. The common justification for such defences, however, is the society's right of self-determination. Anthropologists also take up the cause of oppressed minorities within the societies that they study. For example, feminist anthropologists work to improve the status of women in many cultures. Thus even when denying absolute moral values, anthropologists embrace moral guidelines that are supposed to hold across cultures. They unilaterally condemn behaviour that infringes on the rights of others.

Antiochus (*c.*130-68 BC)

For most of his career the Greek philosopher Antiochus of Ascalon, a pupil of Philo of Larissa, was an orthodox 'sceptical' Academic. He then changed his philosophy: some called him a Stoic, but he himself claimed to be returning to the Old Academy of Plato and his immediate successors. He took a generous view of his new home, urging that the Peripatetics and the Stoics were not new schools of thought but mere modifications of Platonism, and the philosophical position which he advocated was a 'syncretism' - an amalgam of ideas and doctrines and arguments taken from several sources. To philosophy itself he contributed little, but he was a figure of considerable importance in the larger world, where he presented Greek philosophy to an educated Roman public.

1 Life

Antiochus came from Ascalon in Syria. Circumstantial evidence places his birth *c.*130 BC. At some point he went to Athens, where he studied philosophy with Philo of Larissa and perhaps also with the Stoic Mnesarchus. The Academy won his heart (see Academy): he remained under Philo's wing for an unusually long period and wrote books in defence of Academic scepticism. After years of fidelity he defected - perhaps in the 90s BC. He abandoned scepticism, claiming to restore the true Academy of Plato. The autumn of 87 BC found him in Alexandria in the entourage of the Roman statesman Lucullus. There he was scandalized by Philo's 'Roman books' (see Philo of Larissa §2) and wrote his own version of the story. He may have stayed in Lucullus' company for some years. By 79 BC he was back in Athens, where Cicero (§1, 3) listened to his lectures for six months. A few years later he returned to the East, again in the company of Lucullus. He died, in Mesopotamia, in 68 BC.

Antiochus is referred to as head of a school, perhaps the Academy or perhaps a school of his own. Academic scholarch or not, he was a popular and an influential figure. He had a gentle and attractive personality, and a beguiling eloquence. He charmed Cicero, whom he did not convince, but who described him as 'the most accomplished and the most acute of all the philosophers I have known' (*Academics* II 113). He charmed - and convinced - the scholar Varro. He was the house-philosopher of Lucullus. He also had other friends among the eminent of Rome.

He wrote copiously: we know of certain sceptical books (written before 95 BC); of the *Sosus*, written against Philo in 86 BC; of a work on the agreement between the Stoics and the Peripatetics, dating from *c.*80 BC; of a late essay *On the Gods*; and of a work on epistemology called *Canonics*, the date of which is uncertain. All of these writings are lost; but the speech which Cicero attributes to Lucullus in *Academics* II is described by him as 'Antiochean', and the account of Academico-Peripatetic ethics in Cicero's *On Ends* is said to represent the views of Antiochus and of the Peripatetic Staseas. From these two Ciceronian works we can thus gain an idea of some of the general lines of Antiochus' thought. But Cicero is not translating, or even paraphrasing, Antiochus. Some scholars have supposed that Antiochus ghosted many or most of Cicero's philosophical works, and that he lies behind various other later philosophical texts. There is nothing to be said for these suppositions.

2 Thought

When, in 87 BC, Philo gave up scepticism and the Stoic definition of knowledge (see Philo of larissa §2; Stoicism §12), Antiochus was upset. Not because Philo had become a dogmatist, but because he had rejected the definition:

> when Philo weakens and destroys this, he does away with any criterion for what is known and unknown; hence it follows that nothing can be apprehended and he foolishly finds himself in the position he least wished.
>
> (Cicero, *Academics* II 18)

The criticism of Philo is weak, but Antiochus' own position emerges with clarity: he is a dogmatist, not a sceptic; and he believes that the Stoic definition of knowledge must be upheld.

Antiochus himself had converted from scepticism to dogmatism some ten years earlier. (Since Cicero did not know why he changed his opinion, we will never uncover his reasons.) In his own view, he removed from the New Academy to the Old. Others seemed to see matters differently:

> Antiochus led the Stoa into the Academy, so that it was actually said of him that he practised Stoic philosophy in the Academy for he tried to show that the Stoic doctrines are found in Plato.

(Sextus Empiricus, *Outlines of Pyrrhonism* I 235)

The accusation of Stoicism is not a Sextan absurdity: Cicero remarks that 'although he called himself an Academic, he was - if you changed a few items - a full-blooded Stoic' (*Academics* II 132). How so? And if so, why did not Antiochus simply convert to Stoicism (as Cicero himself pertinently asked)?

Cicero observes that the Old Academy and Zeno the Stoic 'disagree on one point only and agree wonderfully in everything else' (*Laws* I 53-4) - and he ascribes the observation to Antiochus. According to Antiochus, the Stoics were at one with the Old Academy; and in addition, 'the Stoics agree with Peripatetics in substance and dispute only over terminology' (Cicero, *On the Nature of the Gods* I 16). Thus Stoicism and Peripateticism are essentially forms of Platonism, so that a move to the Old Academy was by that very token an acceptance of Stoic and Peripatetic philosophy.

Granted this conglomerative or syncretistic account of Old Academic philosophy, Antiochus' 'Stoicism' ceases to amaze. But the syncretism itself may seem bizarre. None the less, it was not a crude fantasy: Antiochus knew something about the history of philosophy and based his syncretic claim on putative historical fact; nor did he pretend that Zeno and Aristotle swallowed Platonism whole and agreed perfectly with one another. Moreover, certain features which to us seem essential to Platonism - notably the theory of Forms - had no place in Antiochus' scheme of things; and other early Platonists had made a contribution to the philosophy of the Old Academy - Antiochus 'especially approved of Polemo' (*Cicero, Academics II 131*).

In any event, the syncretism is far from idiotic. One dogmatic school is omitted from it: Epicureanism. Antiochus realized that the cleft in dogmatic philosophy divided the Epicureans from everyone else. On the main questions, Old Academics, Peripatetics and Stoics were indeed in broad agreement: they were for knowledge and against scepticism, for virtue and against voluptuarism, for teleology and against mechanism, they were for continuity and against atomism.

Antiochus' syncretistic philosophy dealt with all three of the traditional 'parts' of the subject (logic, physics and ethics); but he urged that

> there are two things of the greatest importance in philosophy: the judgment of truth and the determination of the good. For no-one can be wise unless he is aware both of the beginning of knowledge and of the end of desire, unless he knows whence he is to begin and whither he is to journey.

(Cicero, *Academics* II 29)

For the beginnings of knowledge, Antiochus sketched a standard empiricist account of the development of science from sense-perception; he defended the Stoic definition of knowledge; and he argued that attacks by sceptics all failed. For 'the end of desire', Antiochus used the 'Carneadean division' (see Carneades §2) and urged that the 'end' or *telos* consists in the primary goods of nature together with virtue. He managed to marry this rudely Stoic thought to the Aristotelian idea that the *telos* is intellectual activity or *theōria*. He was also exercised by the question of whether 'external' goods such as riches and beauty are necessary for happiness (see Eudamonia). He answered with engaging good sense that you can be happy if you are poor and ugly but that to be *very* happy you need to be wealthy and handsome.

3 Influence

Antiochus had some professional pupils, but most of them deserted his doctrines. His syncretism was not welcomed by the Stoa. Indeed, there is no evidence that his new version of the Old Academy was taken seriously by any of his colleagues. (There is nothing in the old theory that it was Antiochus who inaugurated what we now call 'Middle Platonism' (see Platonism, Early and Middle).) But he was not an insignificant figure. He was writing primarily for a lay public - a public of educated and intelligent Romans. For such a public, technical treatises and professional pedantries were inappropriate, and the rough syncretism which Antiochus offered made sound sense. Antiochus succeeded in impressing Cicero, and Cicero was no slouch in philosophy.

Antiphon (late 5th century BC)

Antiphon was a Greek Sophist. His most famous work, On Truth, partially survives in two substantial papyrus fragments, plus a number of purported quotations. It sets up a bold antithesis between the claims of physis *(nature) and* nomos *(law/convention), arguing that it is more advantageous to follow nature when one can do so without detection. The antithesis suggests several important questions about the meaning of 'nature' and its role in ethics, the origin of social laws and their authority and the meaning and value of justice. It is disputed whether he is to be identified with the orator Antiphon of Rhamnus.*

1 Life and works

Nothing is known of Antiphon's life. Doubts over his identity with Antiphon the Orator rest on the apparent tension between the conservative views of the Orator's *Tetralogies*, in which obedience to law is highly praised, and the seemingly radical arguments of *On Truth*. For similar reasons some have doubted whether the same man could have written *On Truth* and the conventional gnomic utterances of *On Concord*. In defence of a single identity it has been urged that: (1) *On Truth* is not as radical as it appears, but simply a plea for legal reform; (2) its doctrines, although radical, are not endorsed by Antiphon himself; and (3) Antiphon changed his mind. Antiphon is also credited - although this too is disputed - with a *Politicus* (Statesman) and *On the Interpretation of Dreams*, but these attributions too are disputed.

2 *On Truth*

In *On Truth* Antiphon argues that 'justice' consists of not transgressing the laws and customs (the *nomoi*) of the state in which you are a citizen. Consequently, to treat justice in the way that is most advantageous to yourself you should respect the *nomoi* in the presence of witnesses, but follow the claims of nature when witnesses are absent. Disobedience to nature will always harm you; disobedience to the *nomoi* will harm you only if you are detected. Furthermore, most *nomoi* are hostile to nature and act as shackles, whereas those things laid down by nature as advantageous promote freedom and pleasure.

Nor can the law provide the protection it promises: it cannot prevent aggression, nor guarantee that aggressors will be found guilty. Laws and customs are also based on false distinctions of class and race: we all possess the same intrinsic needs and faculties. Finally, the *nomoi* that we call 'justice' are internally contradictory: they require an individual not to harm anyone except in retaliation, yet if called upon as witness a person is required to give potentially harmful evidence in court against someone who has never harmed them. Giving such testimony may also prove dangerous: the witness may have made an enemy for life.

3 The claims of nature

What precisely is meant by 'nature'? Internal evidence suggests Antiphon means 'human nature', but the opposition he draws between this and culture prompts the fundamental question whether such a thing as 'raw' unsocialized human nature exists, and how we could know about it even if it did.

Even if we grant that Antiphon's stark distinction between nature and culture is sustainable, why does he rank the claims of nature above those of society? His first argument appeals to the automaticity of nature's reprisals if flouted, as opposed to the uncertain outcome of a flouted law or convention. Antiphon is ascribing to nature the inevitability which Greek thought had traditionally ascribed to the anthropomorphic deities or fate; in this he may have been influenced by the mechanical physical systems of Leucippus and Democritus.

The inevitability of nature's workings would nevertheless be irrelevant without Antiphon's further claim of a systematic hostility between *nomos* and nature, with an individual's advantage tied to following the latter. In Greek 'advantageous' has medical connotations, and apparently Antiphon is primarily arguing that only by following the claims of nature can we safeguard our physical wellbeing, and indeed survival. His examples of social constraints, however, suggest that he is thinking not only in physiological terms but also of desire-satisfaction in general.

What are these constraints on our natural inclinations? Antiphon certainly holds (1) that the *nomoi* discourage us

from attacking a potential aggressor, and encourage us to honour our parents, even if they have maltreated us: in both instances our natural tendency towards self-protection is thwarted. He may, however, also be claiming (2) that society restrains us from aggressive behaviour in general, and from satisfying whatever desires we happen to have. If this is his position (the text is too fragmentary to allow certainty), then underlying his argument is a view of 'raw' human nature as comprised of fierce egoistic drives antithetical to social harmony.

This choice between readings substantially affects the tenability of Antiphon's position. On reading (1) it seems reasonable for him to argue that social conventions which hinder our ability to defend ourselves are injurious to the individual. On reading (2), however, one may question whether social restrictions on aggressive behaviour in general are in fact ultimately to the individual's disadvantage. Clearly such constraints aim to frustrate the immediate desire, but one may argue that in the long run all individuals are better served if certain aggressive and egoistic aspects of human nature are curbed wholesale: what Antiphon regards as fetters could also be regarded as the bonds which keep society together. One might have expected Antiphon's own words to prompt him in this direction. He does after all admit that death is natural yet disadvantageous; why then does he not concede that a considerable number of the *nomoi* are aimed at protecting the individual from premature death? It is true that he nowhere recommends discarding the *nomoi* altogether, but he still does not consider the general undermining effect on security that repeated disregard for the *nomoi* might have. Possibly his argument is intended only to apply to those who can take care of themselves in all eventualities.

Furthermore, if the *nomoi* are generally disadvantageous, how did they come to exist at all? Antiphon gestures towards a social contract theory: there are opaque references to the *nomoi* being 'agreed' and to 'those who made the agreement' (it is unclear whether this is intended to represent a historical event). This supposed agreement is used by Antiphon as a reason for disobeying the *nomoi* - 'agreed' is interpreted as 'artificial' - but it is equally possible to reach the opposite conclusion: the *nomoi* were agreed because they were perceived to be beneficial and this is a good reason for obeying them. Protagoras (§2) maintained precisely such a position, and it may be that *On Truth* is partly directed against him. Again, the question is raised whether Antiphon's argument is intended to apply to everyone or only to those who think they have sufficient resources to ignore the benefits of a social contract.

Antiphon's attack on the *nomoi* continues by claiming that they give unmerited preferential treatment to the high-born and Greeks (and given that most Greeks justified their practice of enslaving other races by appeal to the racial superiority which they claimed, he is probably criticizing the institution of slavery as well). Such criticisms suggest a reason why Antiphon called his work *On Truth*: he wishes to oppose the false ontological divisions of *nomos* to the true divisions of *physis*. In a separate fragment he also deplores the ambiguity of language; his criticisms in the papyrus fragments of the internal contradictions in the notion of 'justice' may be an example of this (Caizzi 1989).

4 Practical implications and influence

What, if anything, is Antiphon proposing that we actually do? On one view he is not recommending any course of action: he is not speaking *in propria persona* but simply setting up a debate. That would still leave the question whether the words in the text, even if not endorsed by Antiphon, are saying that we *ought* to follow nature when witnesses are absent; and if they are, whether this is an example of the 'naturalistic fallacy', the (allegedly) illegitimate inference of a prescription for action from a simple description of how things are (see Naturalism in ethics §3). The most plausible interpretation is that the text commends following nature as advantageous, but does not set it up as a moral imperative; it certainly does not propose an alternative description of 'justice'.

Another possibility is that Antiphon's real concern is with legal reform: he wishes to remodel the *nomoi* to harmonize with nature. The key issue here is again Antiphon's underlying view of humanity: if he thinks our natural inclinations tend towards unprovoked aggression rather than mere self-defence, then it is unclear how the *nomoi* could be remodelled accordingly yet still retain their social character. Nevertheless, his criticisms unquestionably force us to reconsider the origin and purpose of our own laws and customs and the nature and function of legal punishment.

Perhaps Antiphon's most important contribution to philosophy is his insistence that human physiology and psychology be included in ethical and political thought: our basic needs and desires cannot be ignored. The

tensions he perceived between these natural desires and the claims of society were taken up in Plato's *Republic*, he was thus the first to lay down what Plato saw as the fundamental ethical challenge.

Anti-positivist thought in Latin America

Anti-positivist philosophy arose in Latin America at the turn of the twentieth century in response to the dominance of closed positivistic systems of historical development in the climate of intellectual opinion. Argentina, Mexico and Uruguay were all centres of anti-positivist theorizing. Philosophers such as Mexicans Antonio Caso and José Vasconcelos, the Argentinian Alejandro Korn and the Uruguayan Carlos Vaz Ferreira attacked Auguste Comte's positivism, as well as deterministic forms of scientific Marxism and Herbert Spencer's social Darwinism for their denials of creative freedom and spiritual values. Latin American anti-positivism is characterized as a form of modernism although it incorporates elements of traditionalism. It is self-consciously critical of the limitations of modern progressivism and willing to supplement the modern paradigm with premodern discourses. Anti-positivist philosophy is also firmly committed to the modern embrace of process over fixed form.

Latin American anti-positivism is founded in a comprehensive interpretation of experience that embraces phenomena such as creative freedom, tentative and experimental thinking, imaginative coordination and charitable love. These aspects are excluded from the purview of what positivists allow to be objects of scientific knowledge. Anti-positivists interpret experience as a bi-polar struggle in which the free side of life battles to prevail over the forces of necessity, system, abstraction and egoism.

South American anti-positivists concentrated on issues of knowledge and the structure of thought and experience, whereas Mexican anti-positivists, who were products of a formal education modelled on Comte's prescriptions, undertook a more total revolt. This revolt had metaphysical, moral and political dimensions.

For the most part anti-positivists did not fully escape the doctrines they criticized. They took from these doctrines descriptions of unredeemed, degraded and mechanized life which they opposed to redemptive practices of struggle.

1 Motivation

At the turn of the twentieth century, positivism was the dominant tendency of thought, philosophy and ideology in Latin America. In the strongest and most specific sense, the Mexican dictatorship of Porfirio Díaz attempted to legitimate itself as the applier of Auguste Comte's positivistic philosophy to national development, which included basing the educational system on a Comtian curriculum (see Comte, A.). In a more general sense, evolutionary philosophies with naturalistic foundations, such as Comte's positivism, *fin-de-siècle* scientific Marxism and Herbert Spencer's social Darwinism, shaped the major component of educated opinion throughout Latin America, especially in Argentina and Uruguay (see Spencer, H.; Marx, K.). Anti-positivism is the intellectual response to the positivist milieu of the generation that came of age in the first two decades of the twentieth century.

Latin American anti-positivism is determined by a sense of intellectual suffocation from positivistic systems. Late nineteenth-century positivism was naturalistic, deterministic, evolutionary, rationalist and scientific. The generation that came of age in that climate of opinion rebelled against confinement in prisons of thought which justified and even glorified inadequate social conditions, reduced human beings to egoists and had already mapped out the future. Drawing upon the emerging vitalistic philosophies in Europe, such as Friedrich Nietzsche's life philosophy (see Nietzsche, F.) and Henri-Louis Bergson's vitalism (see Bergson, H.-L.; Vitalism) both of which opposed monistic nineteenth-century systems, the Latin American anti-positivists explored and advanced dimensions of human existence that had been neglected or silenced by positivism.

Latin American anti-positivism is a proclamation of the liberty to break out of the confines of nineteenth-century opinion and be open to a wealth of new experiences. As a variant of modernism, it is self-conscious of its own modernity and affirming of it, although, perhaps critical of it.

2 Major figures

The major Latin American anti-positivist philosophers include José Vasconcelos, Antonio Caso, and two generations later Leopoldo Zea in Mexico, Alejandro Korn in Argentina and Carlos Vaz Ferreira in Uruguay. The South Americans carried on their anti-positivist projects in the areas of epistemology and philosophy of experience, whereas the Mexicans took a more complete approach that included metaphysics, ethics, depth

psychology, sociology of knowledge and social philosophy, as well as reflections on knowledge and experience. Also, the South Americans based their modernism on an extension of the modern fixation on the category of development to an affirmation of the pure process of creative freedom. Whereas the Mexicans, while also insisting on creative freedom, brought to bear pre-modern thought (with its normative content) on their ethical and sociopolitical positions. The South Americans could be considered to be progressive modernists, kindred to William James in the USA, who reveal the intuition of continuous change which grounds and simultaneously deconstructs any evolutionary system of development. The Mexicans, in contrast, are complex figures who resemble Anglo-American traditional modernists, such as T.S. Eliot, Irving Babbitt and George Grant, in their return to pre-modern discourses, despite the utopian humanism rather than conservatism evident in their social philosophy.

As epistemology and philosophy of experience, Latin American anti-positivism has a basic structure which distinguishes it from other vitalist and existentialist tendencies (see Existentialism; Epistemology, History of). The anti-positivists share a commitment to an expanded empiricism which comprehends all aspects of human experience, including those that do not seem amenable to the methods of natural science (see Empiricism). They also subscribe to a dualistic philosophy of experience in which they set up irreducible polarities in human experience and then describe and prescribe a continuous struggle to overcome one side of those dualisms.

The substance of the dualisms developed by Latin American philosophers pits creative liberty, aesthetic synthesis, disinterested commitment to ideals, charity and the flux of fermentative thought, against mechanistic determinism, material entropy, utilitarianism and fixed and absolute systems (see Utilitarianism). Underlying this content is a deeper philosophical structure which involves uncompromising commitment to describe clearly the highest human ideals joined with the equally intense commitment to describe realistically the limitations, failings, frustrations and coercions of human existence. It is within the tension set up between uncompromising idealism and intense realism that human beings struggle to realize their provisional victories over physical and spiritual death.

Korn constructed his philosophy of creative liberty from a Kantian background, arguing that Kant's dualisms can be made empirical by interpreting the split between subject and object as the experienced opposition between liberty and necessity (see Kant, I). For Korn (1963), the field of experience is a dynamic process in which subject and object are reciprocal functions. Necessity is objective in that it comprehends the succession of facts linked by the principle of physical causality into mathematical laws and excludes personal will. Liberty is definitive of subjects, constituting them as a process of valuation presupposed by the plurality of ideals acknowledged by Korn, such as wellbeing, happiness, love, power, justice, sanctity, goodness, truth and beauty. According to Korn, epistemology and axiology are inseparable: as a process of valuation, the founding act of the subject is the valuation that there be a valuing process, that is, the affirmation of creative liberty raised against economic coercion, the more intimate coercion of the passions and the tyranny of necessitarian doctrines such as nineteenth-century positivism (see Axiology).

Vaz Ferreira, more strict an empiricist and more sceptical than Korn, based his dualistic philosophy of experience on what he called the greatest revolution in intellectual history which was taking place in his own time - the liberation of thought from words. Vaz Ferreira (1961) distinguished between thought which draws from its datum a system meant to be applied to every case, and thought which reserves and elaborates its datum so that it becomes available to enlighten deliberation on concrete problems. The latter, known as fermentative thinking, operates according to a 'living logic' that is personal and intransferable and reaches its fruition in 'hyper-logical good sense' (1961: 197). This is a process of balancing opposed arguments and facilitating the interplay of diverse ideas so as to prevent any single idea from dominating thought and protect against systematization. Like Korn, Vaz Ferreira prescribes a philosophy of struggle, a life of 'superquixotism' (1961: 274) in which the individual, on the one hand, renounces adherence to any single ideal or value theory as that would bind life to a system, and on the other, embraces an effort to appreciate a multitude of diverse and sometimes contradictory ideals. To Vaz Ferreira, struggle is defined with particular clarity because he challenges individuals to engage the mechanistic aspects of their own thought.

3 The Ateneo

Mexican anti-positivism was far more intricate, historically-based and comprehensive than its South American counterpart. The initiators of anti-positivist philosophy in Mexico were part of a larger group of rebels

representing different branches of the humanities. They were the privileged products of the positivistic curriculum which had been set up during the long rule of Díaz. In the first decade of the twentieth century, these young dissidents created a counter-educational institution of their own which they called the Ateneo de la Juventud (Athenaeum of Youth). The institution was partly devoted to fostering extensive study of the ancient Greek classics in order to liberate the mind from the confines of positivistic doctrine. Positivism in Mexico was a totalistic ideology that called for economic modernization, scientific education and administration of the country by technocrats, or *científicos*, who claimed they were above politics. Given the anti-metaphysical bias of positivism, the initial project of the Ateneists was the rehabilitation of metaphysics. However, they were not traditionalists or reactionaries, but modernists, who questioned the deprivation of modern values while maintaining the primacy of action and process over contemplation and form.

The aims of the Ateneists were not confined to educational reform, but touched on political morality. Caso, the only member of the Ateneo who supported Díaz, was still able to summarize his generation's criticism of the positivistic polity for making economic development the supreme goal of the society, believing that wealth was the sole basis of strong government and suppressing democracy in the name of national welfare. This is not to say that the members of the Ateneo were primarily concerned with political issues, or that they were direct forebears of the Mexican Revolution of 1910, but rather that their cultural politics, like that of the French philosophers of the eighteenth century, helped to undermine the legitimacy of established authority.

The two leading philosophers of the Ateneo, Caso and Vasconcelos, went on to write bodies of work that touched on most of the major branches of philosophy. The basic structure of their thought was the same as that of their South American counterparts. It was a comprehensive empiricism constituted by a polarized struggle. For Vasconcelos (1961), the struggle was between the ascending and erotic tendency of conscious experience as a process of coordinating heterogeneous contents into moving totalities, or aesthetic wholes, and the counter-tendency towards entropy, the dispersion of things into flat homogeneity. Like Vaz Ferreira, Vasconcelos advanced an informal logic to describe the coordinative process he identified. Vasconcelos (1961) opposed his 'organic logic', based on the categories of melody and counterpoint, to conceptual logic, which analyses things as components and then reconstitutes them through systems of abstraction. For Vasconcelos, life should be a ceaseless struggle to overcome entropy in favour of coordination.

Caso's (1943) dualism is moral as it puts into play opposing attitudes to existence. At one pole of experience is 'existence as economy', the principle of the positivistic polity which prescribes maximum advantage with minimum effort. At the other pole is 'existence as disinterest', or aesthetic contemplation and 'existence as charity', or the pure act of self-giving love, which transcend the economy of selfishness by prescribing, respectively, maximum effort with indifference to advantage and maximum effort with minimum advantage. For Caso (1943) life is a heroic struggle to overcome and reverse the normal selfish tendencies of the organism.

In their revolt against positivism both Vasconcelos and Caso retained its stamp: Vasconcelos by using the physical science of his time as a metaphor for the structure of experience and Caso by accepting as true the positivistic model of the individual as a selfish competitor. Their prime concern was not restrictive speculative systems parading as scientific, but forces in human nature that impede the fulfilment of spiritual value, which they understood as non-natural, not extra-experiential. In their later work, Vasconcelos and Caso, having witnessed the rise of Communist and fascist regimes in Europe, like many intellectuals throughout the Western world, turned to the Christian faith as a bulwark to protect the values they had sought to redeem from positivistic neglect and disparagement. Indeed, they recognized in twentieth-century totalitarianism the same phenomenon against which they had battled in their youth (see Totalitarianism).

4 Ramos, Zea

In the generation following the Ateneo, one major philosopher rose up as an organic critic of the anti-positivists. Samuel Ramos, a former student of Caso, broke with his master over the issue of basing philosophical reflection on intuition, which all the anti-positivists had done in some way, following Bergson. According to Ramos anti-positivism had erred from attention both by degrading reason and diverting thought to private states, to coming to terms with and improving objective conditions. Although he was a realist opposed to according primacy to imagination and introspection, Ramos's reaction did not represent a return to positivism. Rather, it represented an exploration of self-critical diagnosis of national character which culminated in his classic ***El perfil del hombre y***

la cultura en México (Profile of Man and Culture in Mexico) (1934). The book had many imitators in the decades following its publication. Later in his career, Ramos grew closer to anti-positivism, drawing on Max Scheler's anti-naturalistic axiology to ground a new humanism that would save civilization from totalitarian threats (see Scheler, M.F. §5).

The cycle of Mexican anti-positivism reached completion in the next generation in Leopoldo Zea's *El positivismo en México (Positivism in Mexico)* (1968), which applied Karl Mannheim's sociology of knowledge to positivism as an ideology. Zea argued that behind the facade of scientific administration were the particular interests of a small segment of the middle class who reaped their rewards by representing foreign economic interests. For Zea, the decline of positivism in Mexico was due to the increasing exploitation of the rest of the middle class by the positivistic elite and by the inability of positivism to preserve its claims to political neutrality against the attacks of liberals and Catholics. This led to the revolution of 1910. By the time the Ateneo arose, positivistic ideology and educational practice had become so diluted that the governing elite no longer had any clear legitimating principle.

From the viewpoint of sociology of knowledge, the anti-positivist generation in Mexico represented the middle class that had been marginalized by the positivistic elite. Their appeal to spiritual values sublimated the democratic demands that would be expressed in the revolution. Their subsequent fusion of utopian, often religious humanism and pre-modern discourses reflected the equivocal role of the post-revolutionary middle class as both essential to and alienated from the corporative structures that developed to integrate workers and peasants into the post-revolutionary regime.

Antirealism in the philosophy of mathematics

Realism in the philosophy of mathematics is the position that takes mathematics at face value. According to realists, mathematics is the science of mathematical objects (numbers, sets, lines and so on); mathematicians, to use the old metaphor, are discoverers, not inventors. Moreover, just as there may be truths about physical reality which we can never know, so too, realists say, there may be truths about mathematical reality which we can never know.

It is this claim in particular which antirealists find unacceptable. Equating what can be known in mathematics with what can be proved, they insist that only what can be proved is true. (Only what can *be proved: different accounts of what this 'can' means, facing different difficulties, generate different positions.) This leads antirealists to recoil not only from realism but also from the practice of mathematicians themselves. For the orthodox assumption that every mathematical statement is either true or false would be invalidated, on the antirealist view, by a statement that was neither provable nor disprovable. Not that antirealists themselves can see it in these terms. For if a statement were neither provable nor disprovable, that would itself be an unprovable truth about mathematical reality. Antirealists must learn how to be circumspect even in defence of their own circumspection.*

1 Realism and its rivals

Consider the following view. Any mathematical statement such as ' $7+5=12$' or ' $7+5=13$' or 'Every even number greater than 2 is the sum of two primes' is straightforwardly true or false. If mathematical reality is as the statement says it is, then the statement is true. Otherwise, it is false. How the statement connects with mathematical reality is indicated by its grammatical structure. To each singular term there corresponds an object, to each sortal noun a kind of object, to each quantifier a range of objects, and so on. Which grammatical category an expression belongs to depends solely on how it functions. Thus '7', which functions as a singular term, *is* a singular term: it stands for a particular mathematical object. 'Prime', which functions as a sortal noun, *is* a sortal noun: it picks out a particular kind of mathematical object. 'Every even number', which functions as a quantifier, *is* a quantifier: it ranges over a particular domain of mathematical objects. These objects, which exist outside space and time, are mind-independent. How they stand in relation to one another is not determined by how we think they stand in relation to one another. In some cases how they stand in relation to one another is completely unknown. It may even be unknowable.

This is, in its most extreme form, 'realism' (see Realism in the philosophy of mathematics). It is also known as 'Platonism' (see Plato §10). But if this is realism, then any number of things might reasonably be meant by 'antirealism'. Each part of this view can be challenged, and has been. Thus there are those who have claimed:

(1) That no mathematical statement is strictly true or false: mathematics consists in the manipulation of meaningless symbols in accordance with certain formal rules.
(2) That this is true of certain auxiliary parts of mathematics: not *all* mathematical statements are strictly true or false (see Hilbert's programme and formalism).
(3) That all mathematical statements are strictly true or false, but not straightforwardly so: ' $7+5=12$', for example, is like 'Hamlet was the prince of Denmark' - a fictional truth that is literally false.
(4) That the apparent grammatical structure of mathematical statements is misleading: '7' is no more a singular term than 'John's sake' in 'She did it for John's sake'.
(5) That the apparent grammatical structure is not misleading, but does not determine in the standard way how mathematical statements connect with mathematical reality: '7' does not stand for a particular object, but rather indicates part of a structure which any objects whatsoever could instantiate.
(6) That there are particular mathematical objects in just the way that the grammatical structure suggests, but they are mind-dependent creations of ours: how they stand in relation to one another is not totally independent of how we think they stand in relation to one another (see Intuitionism; Constructivism in mathematics). This allows for the possibility that there are certain mathematical statements, rather like 'Father Christmas is left-handed', whose truth or falsity has never been settled (see Cantor's theorem; Continuum hypothesis; Existence).
(7) Finally, that how things are in mathematical reality, though it is sometimes unknown, is never unknowable. This brings us full circle, for, as we shall see, this last challenge in turn becomes a challenge to the idea that every mathematical statement is true or false.

2 The antirealist challenge

The term ‘antirealism’ is most frequently reserved for the last of the above challenges, and that is what this entry will focus on. Not that only one view about the nature of mathematical truth is in question. On the contrary, as we shall see, there are radically opposed views which issue in this particular challenge: that is, there are radically opposed reasons for thinking that mathematical truth can never outstrip knowability.

Knowability in a mathematical context can be regarded as provability. The idea of a proof must then be suitably construed. For instance, a self-evident axiom must be allowed to count as a one-line proof of itself: otherwise it would be unprovable, and hence, *ex hypothesi*, unknowable. On the other hand, clearly not every mathematical statement can count as a one-line proof of itself. Let us assume that a satisfactory account of proof can be given. The question now is: can there be unprovable mathematical truths?

One reason for denying that there can be was mentioned in the previous section. If mathematical objects are mind-dependent creations of ours, then there is nothing to them beyond what is invested in the various principles of proof that constitute the creation. The best-known exponent of such a view was L.E.J. Brouwer (1912). He held further that the raw material for the creation is provided by something essentially private and incommunicable: our experience of time. This is the position known as ‘intuitionism’.

It is a consequence of intuitionism that the meaning of a mathematical statement is itself something essentially private and incommunicable. A diametrically opposed outlook is canvassed in the writings of Michael Dummett. According to this outlook, the meaning of a mathematical statement is something essentially public and communicable. So there can be nothing more to that meaning, ultimately, than how the statement and its constituents are used in actual mathematical practice: nothing else of potential relevance can be communicated. But this too leads to a denial of the possibility of unprovable mathematical truths. For if a mathematical statement were unprovably true, then its meaning would be something that went beyond how the statement and its constituents were used, or indeed could be used.

This second brand of antirealism, which I shall refer to as ‘Dummettian’ antirealism (though Dummett has never actually endorsed it; see Dummett 1973; Dummett, M.A.E. §3), depends on broadly Wittgensteinian considerations about the nature of meaning (see Wittgenstein, L. §12). Such considerations could just as well be applied in a non-mathematical context. Nevertheless, there are reasons for thinking that they are peculiarly suited to mathematics. For whether or not mathematical objects are mind-dependent creations of ours, there is surely something in the idea that they are nothing apart from the techniques and proof-procedures of mathematical practice. They lack the ‘solidity’ of physical objects. So even if there is some prospect that we can capture such ‘solidity’ in our use of language, and thereby express inaccessible truths about physical objects, there is no prospect that we can do anything similar in the case of mathematical objects.

A third brand of antirealism takes off from the observation that mathematics makes essential use of infinite domains. On one very attractive view, an infinite domain is unlike a finite domain in that its members cannot be given ‘all at once’. Somewhat less metaphorically, they cannot all have a separate involvement in any one state of affairs, or make a separate contribution to any one truth. For a statement about them all to be true, there has to be a single principle which determines its truth. That is, there has to be a proof.

All these brands of antirealism have a revisionary impact on standard mathematical practice. Consider a statement that has never been proved or disproved. At the time of writing, Goldbach’s conjecture - that every even number greater than 2 is the sum of two primes - is an example. It is part of standard mathematical practice to assume that the statement is either true or false. (This is an application of the law of the excluded middle.) Antirealists cannot share this assumption. To make the assumption is to register indifference about whether the statement can be proved or disproved. It is to allow that the statement may be true without proof, a kind of ‘infinite coincidence’. This is precisely what antirealists cannot allow.

3 What kind of possibility does antirealism involve?

The antirealist view is that only what can be proved is true. A much more radical view (not without adherents) is that only what *has been* proved is true. By holding back from this more radical view, antirealists inevitably draw

attention to the ‘can’. But what sense of ‘can’ is intended? Certainly, it is what can be proved *by us* that counts, and not, for example, by an infinite being existing outside space and time. But that does not answer the question.

Basically, antirealists need to decide whether they mean ‘can in principle’ or ‘can in practice’. Not that a simple one-or-other verdict will do. Both ‘can in principle’ and ‘can in practice’ require further elucidation. (How and where do scientific limitations figure? Or technological limitations? Or medical limitations?) But the broad distinction remains. And it is clear that if antirealists mean ‘can in practice’, then the revisionary impact on standard mathematics is going to be enormous. There are some numbers which are so big that we cannot, in practice, tell whether or not they are prime. So given such a number, we shall not be entitled to assume that the number is either prime or not. More generally, since mathematics cannot be extended to the unmanageably big, we shall not be entitled to assume that mathematical reality is infinite.

The resultant version of antirealism is known as ‘strict finitism’. Many antirealists think that strict finitism is incoherent. Call such antirealists ‘moderates’. For them, the ‘can’ must mean ‘can in principle’. But they need to explain why, given that their arguments would break down if the ‘can’ did not mean that, the arguments are not to be distrusted anyway. Dummettian moderates in particular are likely to experience some difficulty here. Others, whose very starting point is that mathematical reality is infinite, experience no difficulty at all.

A quite different problem for moderate antirealists is to explain why their own version of antirealism is not just a terminological variant of realism. For cannot any statement be proved or disproved *in principle*? Reconsider Goldbach’s conjecture. What is wrong with the following recipe for either proving it or disproving it? ‘Check successive even numbers greater than 2. In each case, ascertain whether or not it is the sum of two primes. Keep going until either every such number has been checked or a counterexample to the conjecture has been found.’ It is of no avail to reply simply that this process might never end. Something needs to be said to forestall the objection that if we spend half a minute checking 4, a quarter of a minute checking 6, an eighth of a minute checking 8, and so on, then the process will end in a minute - at most. Of course, we cannot in practice do this. But that is beside the point.

It is by no means clear that moderate antirealists have nothing to say here. But they may have nothing to say which is not question-begging. For instance, they may be forced to deploy a conception of what is possible in principle which itself incorporates an antirealist understanding of what it is to do infinitely many different things. If so, that is not an objection to moderate antirealism. But it does raise the spectre of realists and moderate antirealists operating with two quite different, incommensurable, individually coherent conceptions of what is possible in principle, together with two correspondingly different conceptions of how to do mathematics. Ultimately, perhaps, the realist is prepared to make certain assumptions in mathematics which the moderate antirealist is not prepared to make, and, to the extent that they are incapable of finding any independent leverage to settle their differences, they are talking past each other.

4 Implications for mathematical practice

The sheer fact that realists are willing to endorse standard mathematical practice might be thought to count in their favour. For, arguably, reversing Marx’s dictum, it is not the business of philosophers of mathematics to *change* mathematics, only to interpret it. (Wittgenstein famously wrote that ‘philosophy leaves mathematics as it is’.) Here, as before, there is a particular difficulty for Dummettian antirealists. For they are only too keen to cast actual mathematical practice in the role of a datum. Dummett’s own reaction to this difficulty is to argue that, even if actual mathematical practice is a datum, it is not an indissoluble datum: nothing in the view he canvasses precludes criticizing some parts of that practice for failing to harmonize with other parts.

Suppose there *is* room for a non-conservative philosophy of mathematics. Antirealists face a further difficulty. They have no satisfactory answer to the question ‘When exactly does standard mathematical practice lead us astray?’. They cannot answer, ‘Whenever a statement is neither provable nor disprovable’. For if a statement were neither provable nor disprovable, that would itself be an unprovable truth about mathematical reality. (To prove that a statement was not provable would already be to disprove it.) Likewise, if, say, there were no proof of Goldbach’s conjecture, nor, as it happened, a counterexample, that would itself be an ‘infinite coincidence’ of the very kind that antirealists disavow. Antirealists have no option, then, but to adopt a kind of stoic silence. Whenever others make assumptions in mathematics which they are not themselves prepared to make, they must

withhold assent, but they have no satisfactory way of saying what is holding them back. As far as anything they can say is concerned, their restraint may be a result, not of nonconformity, but of sheer reticence.

Antirealism remains of the utmost importance, despite this very real difficulty. Indeed, part of its importance may be in drawing the difficulty to our attention. For if antirealists are right, then it may be that their knowledge of correct mathematical practice is a prime example of a fundamental and neglected philosophical category: knowledge that is essentially ineffable.

Anti-Semitism

Anti-Semitism is a form of racism which sees Jews as a dangerous and despicable group in society. It has solid philosophical sources in the work of German Idealism which emphasized the distinctiveness of Judaism and how it has been superseded by Christianity. Both Kant and Hegel made a sharp distinction between Judaism and what they regarded as more rational religions, and they questioned the capability of the Jewish people for playing an integral role in the state. Sartre used the notion of anti-Semitism to show how a sense of self-identity is created by the attitudes of others towards the individual and the group. That is, what makes Jews Jews is the fact that there is anti-Semitism, and there is nothing that Jews can do about anti-Semitism. Anti-Semitism is a problem for the anti-Semites themselves; anti-Semitism, by Sartre's account, is in fact an attempted solution to the difficulties of taking free and authentic decisions. Anti-Semitism has played an important role in Jews' self-definition, in attitudes to the State of Israel and to the religion of Judaism itself.

1 Kant

Kant presents generally critical views of Judaism. He argues that Judaism is primarily a religion of statutes, a system of positive law, and that it is also largely based on revelation. These characteristics lead him to deny its moral character, since the will of a supreme authority cannot be properly considered a source of morality. In Kantian philosophy, the essence of morality is the ability of subjects to place themselves under entirely general and rational laws, so a faith which is limited to a particular people and which is based on a particular form of revelation, does not fit his notion of morality. Kant even criticizes the laws themselves, regarding them as crude imperatives which demand a certain standard of conduct but do not insist on appropriate attitudes. This leads Kant even to deny that Judaism is a stage of religious development in the direction of Christianity, since Judaism has, by his account, so little genuinely religious content. Judaism makes worship of God primary and virtue subsidiary, and so is really just a form of belief limited to a particular group of people.

The emphasis Kant finds in Judaism on obedience to God leads it, he argues, to a form of legalism which he regards as far from a rational faith. Revelation and messianism are problematic from a rational point of view, since they relate to a particular relationship with a particular group of people, and can hardly be seen in universal terms (see Revelation). Also, the laws of the religion seem to be both pedantic and rigid, based more on the necessity to achieve isolation rather than on any quest to establish general forms of behaviour applicable to any human being. The empty legalism of Judaism plays no part in improving the human moral disposition, Kant argues, and so cannot be considered as a genuine expression of rational religion.

2 Hegel

Hegel's views on religions and their interrelationships are far more developed than those of Kant, but they are also quite negative with respect to Judaism (see Hegel, G.W.F.). The trouble with Judaism, says Hegel, is that it is a religion that emphasizes fear, a religion that stresses the object. Hegel has a view of the development of history as a movement of self-consciousness through different historical and religious epochs. In this movement, the ideal is to be approached through an ever-increasing perfection of that self-consciousness. Judaism has an important, but essentially limited, role on the route to perfection. Judaism regards religious law as an independent entity, embodying the self-alienation of human society. This means that Judaism obeys a legal system without the capacity to master society itself. This domination of life by law is total in Judaism, Hegel asserts, and the religion itself is a compulsory faith, with a notion of God that is represented as a command and not as a truth. There is no scope for the notion of individual rights, but a type of divine despotism that bases itself on the family as the ultimate social unit.

Judaism sees the important relationship with God as essentially external, where God is the subject and his creatures the object. This results in alienation from the universe, the effect of which on individual Jews is that they do not regard their lives as belonging properly to them. They instead belong to God; Jews, as a result, are entirely passive in their attitudes to the creator. This is hardly surprising, Hegel reasons, since the nature of Judaism is to deny the possibility of raising human existence to the realm of spirit; that is, Judaism makes such a huge distinction between the divine and the finite that it cannot conceive of transcending that gap. God is regarded as spirit, but to the extent that he entirely transcends the world, which makes it impossible for humanity to be

reconciled with God. Judaism is a constant struggle against idolatry. This struggle is represented by Abraham's leaving his family in Ur to become a wanderer. Jews cannot see the things in the world as embodying the divine. As a result, the ordinary world is literally emptied of the divine. Unlike both Christianity and the religion of classical Greece, Judaism does not offer a dialectical relationship with what is invisible and infinite. Judaism can only serve as an antithesis in the progress of the self-realization of the spirit. That is, it is a stage along the path of increasing self-consciousness and serves to reveal how unsatisfactory a particular way of understanding our links with the divine are. Judaism, concludes Hegel, is a way of thinking which is primitive and needs to be superseded.

3 Sartre

By far the most interesting and original use of anti-Semitism as a philosophical vehicle was created by the existentialist Jean-Paul Sartre. He reverses the traditional way of understanding racism, which was to look at the particular group selected as a target of hatred and to ask what it was about it which made that targeting feasible. Sartre argues, by contrast, that we need to wonder what it is that racism provides for the racist. Furthermore we also should examine the role of racism in creating the despised group itself. The racist, according to Sartre, chooses hatred as a way of avoiding confronting problems rationally. Racism is an attempted escape from the need to think for oneself and to make free decisions. It is essentially a way of trying to escape from the human condition. In his accounts of anti-Semitism, Sartre points out how natural it is for particular people to adopt this way of thinking, since it saves them from the necessity of distinguishing themselves from their social role.

Sartre sees anti-Semitism as a failure of rationality; anti-Semites fail to use rationality to understand that their lowly role in life may be due to their lack of talent, or to an unjust social system. The Jew is the person whom the anti-Semite thinks is a Jew, incorrectly or otherwise. This can result in Jews trying to deny their Jewishness in order to avoid persecution. Sartre criticizes this strategy by Jews, arguing that it is as inauthentic an attitude as the adoption of anti-Semitism itself. The important point is that racism is primarily a problem for the racists. There is nothing the despised group can do to change that attitude.

4 Anti-Semitism as a philosophical notion

It is wrong to see anti-Semitism as a specifically Christian movement, or as having anything particularly to do with Germany. From the very first times that Jews lived among Gentiles, in Greece and the Roman Empire, prejudice against them was often commonplace. The construction of philosophical theories to justify this prejudice did take place for the first time within Christianity. It stems from early Christian polemics against the rival faith and from claims as to the original responsibility of Jews for the crucifixion of Jesus. Embedded in a variety of doctrinal and institutional structures, anti-Semitism was intensified by those structures themselves; for example, by the mercantile the role that Jews were compelled to play in the medieval society.

The theories that bolstered Christian anti-Jewish and anti-Judaic attitudes were followed up in the nineteenth and twentieth centuries by theories that sought to place racism on a scientific footing, arguing that racial differences define human possibilities (see Race, theories of). There were also theories that tried to establish the existence of a Jewish conspiracy against the Gentile world. Such ideas, although largely bereft of evidentiary support, form the theoretical underpinnings of modern anti-Semitism.

It would be quite mistaken to draw a direct linkage between the views of Kant and Hegel on Judaism and the development of the systematic anti-Semitism which has played such an important role in Europe in the last two centuries. For one thing, both Kant and Hegel had many Jewish followers. Those followers saw the ideas of German Idealism as entirely compatible with the principles of Judaism (see German Idealism). Hermann Cohen, for example, was a fervent Kantian and Emil Fackenheim a Hegel enthusiast. On the other hand, the radical distinction which Kant and Hegel both made between Judaism and other systems of religion, which they took to be more rational, was echoed by many lesser thinkers to imply the radical inferiority of the Jewish people or its culture and religion. The idea that Judaism is a morally limited and outmoded religion fosters the notion that Jews are legalistic and are wedded to an archaic way of life and thought, incapable, for that reason of being proper constituents of civil society. Indeed, these modern versions of ancient canards are used, ultimately, in behalf of the claim that Jews are the enemies of society. Such ideas reached an extreme in the thinking that gave rise to the Holocaust (see Holocaust, the).

Some thinkers such as Karl Popper see Hegel as being vastly influential in the development of totalitarian forms of thought, and it is true that Hegel's views on Jews and Judaism do appear congruent with some aspects of later German anti-Semitism. But we need to make a distinction between theories which regard Jews as playing a distinctive or even outmoded role in society, as with Kant and Hegel, and theories which explicitly justify treating Jews in discriminatory or even murderous ways. It may be that there is a psychological, political or rhetorical link between the two types of theories, but there is need not be a logical link between the two types of theories, but there is certainly not a logical link between them.

5 Anti-Semitism and Jewish self-understanding

The significance of anti-Semitism for Jewish self-understanding has been considerable. It played an important part in the construction of theories of Zionism, since at least one rationale for a Jewish state is the difficulty that Jews face as a minority in states dominated by Gentiles (see Zionism). Had anti-Semitism not been so prevalent, the motivation for statehood would not have been so powerful. Also, there is a tendency for some Jews to see themselves as defined through anti-Semitism, as Sartre pointed out, so that they are either victims or defiant resisters of persecution. Some critics of this form of self-definition have argued that it perverts the nature of Judaism. Judaism, they argue, is a religion based on belief in God and the covenant (Goldberg 1995). Its message should not be deflected persistent (if necessary) attention to the need constantly to repel the hostility of actual and potential persecutors. Many Jews find the most potent source of their emotional relationship to Judaism to be their commitment to the State of Israel. But this attachment itself reflects in part the phenomenon of anti-Semitism. For the enthusiasm is directed to the survival of the State and of the Jewish people in the face of threats to the survival of both.

Antisthenes (*c*.445-*c*.365 BC)

Antisthenes was one of the most devoted followers of Socrates. As a young man he was heavily influenced by the display speeches of Gorgias the rhetorician and the interpretation of Homer practised by the Sophists. He himself wrote much in the same vein, although almost all has been lost.

Antisthenes' influence can be recognized most in the writer Xenophon. Although it is likely that he succeeded in annoying Plato and Isocrates, his influence on Cynicism has been greatly exaggerated.

Little survives of his moral philosophy, but what there is is Socratic in conception, and indeed Socrates' own courage and tenacity are its avowed inspiration. Antisthenes focuses on virtue, conceived as inner strength, a fortress founded on wisdom and its unassailable reasonings. Virtue is acquired and maintained by 'exertions', a term deliberately recalling the labours of Heracles: these consist of the struggle to overcome the difficulties of, for example, poverty or unpopularity, by understanding how they can be viewed as good things - provided the riches of the soul are intact. Pleasure and sex are accordingly seen as threats to virtue's integrity. Antisthenes enjoins us to redraw our moral categories: the good and just are our true friends and kin.

In theory of language Antisthenes defended the paradox that contradiction is impossible, deriving his argument from the idea that there can be no successful reference to anything except by its own 'account', revealing what it is.

1 Life and work

Of all Socrates' followers none was perceived as closer to him than the Athenian Antisthenes (Xenophon, *Memorabilia* III 11.17). His origins were apparently humble, and his circumstances not affluent. Calculation of his dates depends on scanty and doubtful evidence. What is clear is that Antisthenes successively inhabited the world of the fifth-century Sophists familiar from Plato's early dialogues and the no-less-competitive intellectual scene of the early fourth century, where Socrates' philosophical heirs jostled among themselves as well as with Sophists and rhetoricians.

Xenophon's Socrates suggests that it was in fact Antisthenes who introduced Prodicus and Hippias to their patron Callias (*Symposium* 4.62). A report by Diogenes Laertius makes him a pupil initially of Gorgias the rhetorician. Much of Antisthenes' literary output reflects his immersion in this milieu : 'He brings the rhetorical style into his dialogues, especially *Truth* and *Exhortations*' (Diogenes Laertius, VI 1). Like the Sophists he wrote numerous works on Homeric interpretation. How early in life he became attracted to Socrates is not clear: Diogenes Laertius suggests middle age; Xenophon's *Symposium* (dramatic date 421 BC) may imply sooner. It is uncertain therefore whether Antisthenes' Sophistic writings belong to a period of his life separate from those recommending Socratic ethics. The Socratic dialogues he is credited with must be assumed to post-date Socrates' death; and his thesis that a person who has attained discretion would do better not to study literature is hard to square with an approach to truth through study of the poets.

The only items surviving intact from a huge body of work are a complementary pair of speeches, quite possibly authentic, entitled *Ajax* and *Odysseus*, in which the two heroes contend for the arms of Achilles. Also preserved is a fragment of a dialogue debating the meaning of Homer's description of Odysseus as a man of 'many ways' (fr. 51), in a manner reminiscent of Plato's *Hippias Minor*. A certain amount can be gleaned from Xenophon's *Symposium* and from the list of book titles found in Diogenes Laertius, (VI 15-18). For further information about Antisthenes' thought we are dependent on doxographical summaries (notably Diogenes Laertius, VI 10-11), occasional quotations or mentions of his views, and - for what they are worth - anecdotes: for example, his notorious anti-Platonic remark 'I see a horse, but I do not see horseness' (fr. 50). These ancient reports are dominated by preoccupation with his Socratic conception of ethics, but Aristotle in particular has some tantalizing references to logical doctrines (see §4).

Xenophon sketches a playful portrait of Antisthenes in his *Symposium*. In contrast with the urbane Socrates he is presented as an abrupt, sarcastic and pedantic interlocutor. But as the work unfolds his fierce attachment to Socrates becomes ever more apparent. This is not simply a matter of his practising a form of Socratic *elenchos* (cross-examination). Antisthenes develops in Socratic style the doctrine that true riches are found in the storehouse

of the soul. And before the end he shows and avows his love for Socrates.

2 Antisthenes and the Cynics

An ancient tradition makes Antisthenes the originator of the Cynic philosophy and teacher of Diogenes of Sinope. It shapes not only the account of Antisthenes but the whole presentation of Cynicism and Stoicism in Diogenes Laertius (see especially VI 2, 15, 21, 103-5), and it is assumed in writers of the imperial period like Epictetus and Dio Chrysostom. Many modern discussions of Antisthenes accept the tradition, or suppose him a principal influence on Diogenes. However, the verdict of the best critical scholarship (for example, Dudley) is that the story is a fabrication.

Although Diogenes' chronology is a good deal more obscure than that of Antisthenes', it is at least doubtful whether the two *could* have met. None of the fragments of early Cynic writers mentions Antisthenes. The distinctive Cynic garb of cloak doubled up, staff and wallet is ascribed to him only in late sources. If Diogenes had a precedent for adopting it, contemporary Pythagoreans like Diodorus of Aspendos seem likelier models. Although Diogenes earned himself the nickname 'dog' - and 'Cynic' means 'Dog-philosopher' - the attempt to derive the expression from the Cynosarges gymnasium where Antisthenes is alleged to have taught seems a desperate measure.

The idea that Diogenes was in some sense Antisthenes' 'successor' could build on Antisthenes' ethics of frugality and inner resilience. What explains the promotion of that idea in the ancient sources is the need of later philosophy, and more particularly Stoicism, to rewrite its own history. The Stoics could not easily deny the impact of Cynicism on their founder Zeno. Opponents represented this as disreputable. Construction of a pedigree for Stoicism through Cynicism via Antisthenes and back to Socrates was to prove an effective way of recovering the moral high ground for Stoics.

3 Ethics

The principal account of Antisthenes' ethical teaching in Diogenes Laertius reflects the preoccupations of Stoicism outlined in §2, certainly in its emphases (VI 10-13, 104-5). Fortunately enough specific items of information are recorded in his pages and elsewhere for a reader to get a sense of Antisthenes' key ideas. The figures of Heracles and Cyrus of Persia, each the subject of more than one of Antisthenes' writings, were evidently presented as exemplars of the proper acquisition of virtue. To achieve it 'nothing was needed but the strength of a Socrates' (VI 11). And Antisthenes famously taught that exertion or *ponos* (as in the 'labours' of Heracles) is a good (VI 2). Deeds, not words, are what matter (VI 11; fr. 86).

This was not conceived as an anti-intellectualist position: 'Get understanding - or a noose', said Antisthenes (fr. 67). The exertions of the good are pictured as a campaign waged from a stronghold of wisdom (*phronēsis*), which has to be constructed by unassailable reasonings. The weapon no one can rob the good of is virtue, and their allies are those who are just as well as brave. The most indispensable item of knowledge Cyrus of Persia acquires is to *un*learn what is evil (fr. 21). Few specific examples of appropriate exertions survive. A bad reputation is said to be good and 'equal to exertion' (Diogenes Laertius, VI 11).

The sayings ascribed to Antisthenes indicate a strong tendency (congenial to Stoicism) to redraw concepts like kinship and friendship in terms of moral notions such as justice and goodness, or to prefer the candour of an enemy to the blandishments of flatterers. Similarly, the law of virtue displaces the established laws of the city as the imperative the wise person will obey. Antisthenes represents wisdom as what enables people to make everything work for them, so that nothing is any longer 'alien'. This philosophy of life is interpreted in terms of the Stoic doctrine that virtue is self-sufficient in Diogenes Laertius' doxography (VI 11).

Antisthenes' views on pleasure attracted quotation by later authors. Most popular was: 'I would rather be mad than feel pleasure' (Diogenes Laertius, VI 3; fr. 108). Other texts reveal a more nuanced position: pleasure is a good if it does not require subsequent repentance (fr. 110); 'there is no pleasure in a symposium without concord or in riches without virtue' (fr. 93); 'we should prefer the pleasure after, not before, exertions' (fr. 113). The power of sex provoked the comment: '*I* would shoot down Aphrodite if I could apprehend her, because she has corrupted many of our fine and good women' (fr. 109). But his most notorious remark on the subject sounds thoroughly Cynic: one should sleep with 'those women who will be grateful' (VI 3), interpreted by Xenophon

(*Symposium* 4.38) as recommending as entirely sufficient immediate satisfaction of physical desire with women who have nobody else to want them. When the doxography in Diogenes Laertius reports that for the sake of having children the wise man will marry, 'sleeping with the women whose nature is best suited' (VI 11), the plural gives cause for suspicion that Antisthenes' amoral advice has been bowdlerized in the interests of moral propriety.

Scholars have harboured hopes of recovering from Xenophon more substantial tracts of Antisthenian moral argument than these brief maxims and summaries. A long speech on the sufficiency of a frugal life provided we possess riches in the soul is put in his mouth in the *Symposium* (4.34-44). This is very likely a free reworking of genuine Antisthenian ideas. But other attempts to identify specific Antisthenian material in the *Memorabilia*, even if it derives inspiration from his view of Socrates and of philosophy, have gone unproven.

4 Language and *logos*

Several texts credit Antisthenes with advancing the claim that contradiction is an impossibility (frs 47-9). One story makes controversy with Plato about the claim the occasion for Antisthenes' composition of his dialogue *Satho* (Diogenes Laertius, III 25, VI 16): the title was intended as a satirical play on the name 'Plato' (fr. 37) - it means 'prick'.

The argument that no one can contradict anyone else carries resonances of the Sophists. For Protagoras(§3) it was a consequence of the relativity of truth. Plato has the Sophist Dionysodorus derive it from the premise that the *logos* or account of each thing must say that thing as it is. So if I succeed in saying the *logos* of some particular thing, you cannot be referring to that same thing at all if you attempt to contradict. According to Aristotle Antisthenes followed Dionysodorus' line of reasoning: 'nothing could be said except by its own (Greek *oikeios*) *logos*, one to one - from which it followed that contradiction is impossible, and one might almost say falsehood in general' (*Metaphysics* 1024b32-4; fr. 49).

It is tempting to connect Antisthenes' premise about 'its own *logos*' with Diogenes Laertius' information that 'he was the first to define *logos*, saying: "*logos* is what reveals the *what it is or was*"' (VI 3). Scholars have disputed whether *logos* here should be taken as 'statement' or 'definition'. Statement has been thought to be too weak a notion to capture something that reveals the *what it is or was*. But if the connection just proposed is correct, any statement that succeeds in being about some particular thing will be a true account of that thing as it is and as nothing else is, and such a statement will therefore satisfy the terms of Antisthenes' definition (or statement). His position on *logos* resembles the view of names ascribed to Cratylus in Plato's *Cratylus*. Similarities with the 'dream' theory of names in Plato's *Theaetetus*, which actually speaks of *oikeios logos* (202a), have also been canvassed in the past, but not much illumination either of the dialogue or of Antisthenes' views has been achieved by the comparison.

Despite affinities between this Antisthenian material and positions argued by Sophists and others in Plato's dialogues, it may well be that Antisthenes conceived of himself as explicating the philosophy of Socrates in logic as he did for ethics. Epictetus attributes to Antisthenes the dictum: 'The starting-point for education is the examination of *onomata* (words or names)' (*Discourses*, I 17.12) and follows it with a very similar remark ascribed to Xenophon's Socrates. Since Socrates was constantly asking the question: 'What is *X*?', it would be natural for Antisthenes to want to clarify what kind of answer would in principle meet the inquiry. There is evidence that he specifically attacked Plato's assumption that what Socrates wanted was a *definition*. Aristotle, discussing the requirements of a good definition, says at one point:

> There is a certain timeliness in the difficulty raised by the Antisthenians and similarly uneducated persons, namely, that it is impossible to define what a thing is (because, it is claimed, a definition is a long *logos*), whereas it can be explained what sort of thing it is, for example it can be explained that silver is like tin, but not what silver is.
>
> (*Metaphysics* 1043b23-8)

(A 'long *logos*' refers to an evasive rigmarole told, for example, by a slave to conceal the truth.) It is obviously difficult to reconcile Antisthenes' doctrine of *logos* with the proposal that the most an attempt at saying what something is can achieve is explanation of what it is like. Perhaps Antisthenes was arguing *ad hominem*: given Plato's wrong assumption that one can reveal the nature of things in terms not special to such things but common

to other things, a comparison is the best one can do - brief and to the point, if not a proper *logos*.

Some have concluded that the only statement that could qualify as a *logos* under Antisthenian rules would be a tautology. It is hard to believe this was his intention, not least because of evidence of exploitation of the idea of *oikeios logos* in his rhetorical theory (fr. 51). But further progress in interpretation is crippled by the complete absence in our sources of any explicit examples of an Antisthenian *logos*, except for his *logos* of *logos* itself.

Applied ethics

Applied ethics is marked out from ethics in general by its special focus on issues of practical concern. It therefore includes medical ethics, environmental ethics, and evaluation of the social implications of scientific and technological change, as well as matters of policy in such areas as health care, business or journalism. It is also concerned with professional codes and responsibilities in such areas.

Typical of the issues discussed are abortion, euthanasia, personal relationships, the treatment of nonhuman animals, and matters of race and gender. Although sometimes treated in isolation, these issues are best discussed in the context of some more general questions which have been perennial preoccupations of philosophers, such as: How should we see the world and our place in it? What is the good life for the individual? What is the good society? In relation to these questions, applied ethics involves discussion of fundamental ethical theory, including utilitarianism, liberal rights theory and virtue ethics.

'Applied ethics' and 'applied philosophy' are sometimes used as synonyms, but applied philosophy is in fact broader, covering also such fields as law, education and art, and theoretical issues in artificial intelligence. These areas include philosophical problems - metaphysical and epistemological - that are not strictly ethical. Applied ethics may therefore be understood as focusing more closely on ethical questions. Nevertheless, many of the issues it treats do in fact involve other aspects of philosophy, medical ethics, for example, including such metaphysical themes as the nature of 'personhood', or the definition of death.

1 Definitions

While the name 'applied ethics' is comparatively new, the idea is not. Philosophy has traditionally concerned itself with questions both of personal morality (what should I do?) and public morality (what is the good society?), but while these questions are fundamental to applied ethics, they could also be said to characterize ethics in general. Applied ethics is therefore distinguished commonly as that part of ethics that gives particular and direct attention to practical issues and controversies.

In the private sphere, ethical issues include, for example, matters relating to the family (see Family, ethics and the), or to close personal relationships (see Friendship), the care of the old or disabled, the raising of the young, particularly where matters of morality are concerned, or personal ethical problems arising for the individual in the work-place. In the public sphere, applied ethics may involve assessing policy in the light of the impact of advances in biomedical technology (see Life and death; Risk; Technology and ethics), or assessing international obligations and duties to future generations in the light of environmental problems (see Future generations, obligations to; Population and ethics). The public arena includes, too, a range of issues for the plural society, such as ethnicity or gender in relation to discrimination, cultural understanding and toleration; more widely still, it may extend to issues of interest also to political philosophy, such as terrorism and the ethics of war. In all these matters, the concern of applied ethics is not only to supply a personal ethical perspective, but also to provide guidelines for public policy.

Applied ethics includes, as well, the area of professional ethics; it examines the ethical dilemmas and challenges met with by workers in the health care field - doctors, nurses, counsellors, psychiatrists, dentists - and by a wide range of workers in other professions including lawyers, accountants, managers and administrators, people in business, police and law enforcement officers. Specific ethical issues such as confidentiality, truth-telling, or conflicts of interest may arise in all or any of these areas, and most professions seek to codify their approaches and provide guidance for their members.

2 Theory and practice

Underlying all such issues are questions about justice, rights, utility, virtue and community. The practice of distinguishing between theoretical and applied ethics must, therefore, be treated with some caution. Indeed, some have regarded the term 'applied' as redundant, on the grounds that there cannot be an 'ethics' which is not applied: on the one hand, they argue, theoretical concepts such as rights and justice should not be viewed as mere abstractions; and, on the other, applied ethics should not be detached from its roots in traditional morality. But while it is important to stress this continuity, there are certain characteristic features of applied ethics which mark

it out in practice from theoretical ethics. These are (a) its greater attention to context and detail and (b) its more holistic approach - its willingness to link ethical ideals to a conception of human nature and human needs (see Human nature; Needs and interests). Thus practitioners of applied ethics may be more willing than proponents of traditional academic moral philosophy to recognize that psychology and sociology, a knowledge of culture and history, the insights of good literature, and even an understanding of humans as biological entities, are all relevant to the determination of moral issues in personal and public life.

The demarcation line between applied and theoretical ethics which this suggests may be drawn at that point on the spectrum of ethics where ethical theory stops short of normative recommendations and confines itself to the analysis of moral concepts such as ‘right’, ‘good’, ‘responsibility’, ‘blame’ and ‘virtue’ and to discussion of what might be called the epistemology of ethics - such theories as ethical realism, subjectivism and relativism (see Analytic ethics; Moral knowledge; Moral realism; Logic of ethical discourse). This is the area sometimes described as ‘meta-ethics’. Drawing the line at this point may be useful so long as it is not allowed to obscure the truth that applied and theoretical ethics are not discrete but lie on a continuum from the particular to the general, the concrete to the abstract.

The ultimate focus of applied ethics may well be entirely particular: the individual case-study. And it is this that gives rise to a further characteristic feature of applied ethics: its concern with dilemmas - not necessarily in the hard logical sense of situations in which it is impossible to act rightly because each of two opposite courses of action is either judged to be mandatory or judged to be wrong; but in the looser sense of cases in which a choice between courses of action may be extremely difficult, the arguments on both sides being compelling, and the person who must act being strongly influenced in opposing directions (for example, to sanction drastic medical intervention to save a severely disabled baby which would otherwise die, or to allow nature to take its course). It should be said, though, that choosing between options which are not morally equal is not, strictly speaking, a dilemma, although it is admittedly likely to be emotionally traumatizing, while choosing between moral obligations that are indisputably of equal weight is not a *moral* problem. The question for applied ethics in such cases may well be whether or not the available options are indeed morally equal.

Because it focuses on individual dilemmas, applied ethics must confront the question of universalization, which may also be seen as a ‘free rider’ problem: many things are judged to be wrong as a result of asking the question, ‘What if everyone did that?’, even though, in a particular case, it might seem harmless and more convenient for an individual to ignore the rule, while benefiting from the fact that everyone else is following it (see Universalism in ethics). The applied ethicist, like the theoretical moral philosopher, must find a way to deal with this problem, but for the applied ethicist, the problem is bound up with the need to employ what is sometimes called moral casuistry. This ancient science is not necessarily to be despised, for while a secondary meaning of the term ‘casuist’ is indeed ‘sophist’ or ‘quibbler’, it was not originally a term of abuse, but simply meant accepting in a theological context people’s desire to work out the ‘right answer’ to a difficult issue of conscience in a particular set of circumstances (see Casuistry).

3 Method

One method of reasoning employed in applied ethics may be compared to that of a designer who starts with a blueprint, but has to adapt it to the materials to hand and to the situations in which it is required. There is some resemblance in this case to the Hegelian method of dialectical reasoning, as well as to the method of reflective equilibrium favoured by such contemporary writers as Rawls (1971), in which intuitions in response to particular cases are measured against principles, causing them to be revised and their implications for particular cases again reappraised (see Moral justification §2). According to this view of the subject, the method of applied ethics is neither purely deductive nor purely inductive. For others, however, the deductive model is more powerful, and the question to be answered in any particular case is simply *which* (inviolable) principle it falls under. Others again would favour the inductive model, according to which, by clearly seeing what is right in particular cases, it becomes possible to formulate a general principle encompassing these and other particular judgments (see Universalism in ethics §3).

In general, discussion of ethical theories in applied ethics aims to pursue, in the direction of the highest degree of generality and abstraction, the question of what humans should do. In practice, discussion of theories is often confined to their implications for the resolution of particular problems, since applied ethics characteristically seeks

to answer the broad question with a much greater degree of particularity.

4 Critics and opponents

In seeking answers to practical problems, applied ethics runs counter to much recent philosophy. For the view that prevailed during the dominance of empiricism and positivism (the greater part of the twentieth century) is that philosophy can have nothing to say about pressing practical problems.

This view is grounded in two important philosophical arguments: (a) Hume's objection to arguments that seek to derive an 'ought' from an 'is' (see Hume, D. §4; Logic of ethical discourse §2-4); and (b) Moore's argument that to identify moral characteristics with 'natural' or empirical ones is to commit a 'naturalistic fallacy' (see Moore, G.E. §1; Naturalism in ethics §3). Both of these arguments must be resisted if applied ethics is to succeed in closing the gap between factual descriptions of situations and moral judgments, and both may partially at least be answered by insisting that some facts 'speak for themselves' - torture, child-murder, genocide, for example.

The argument that facts and values are to be kept apart is, however, less of an obstacle to philosophers outside the English-speaking world; the notion of praxis, for example, is familiar from various continental traditions, including Marxism, the Frankfurt School, and the philosophy of Habermas (see Theory and practice §3); while the idea of the philosopher as *engagé* - as concerned with playing a part in the world - is an important part of French existentialist thought, made familiar in the works of Sartre. These sources have, however, produced a different kind of challenge to the notion of applied ethics as an impartial and essentially reason-based approach to ethical issues in society. Objections to the conception of universal moral norms and to foundationalist procedures in reasoning (the 'postmodernist' challenge) are associated with recent developments in Marxist theory, certain feminist approaches to ethics and epistemology, and the deconstructionist movement - schools of thought which may also adopt an analysis of power-structures in society incompatible with belief in individual freedom of action (see Feminism and psychoanalysis; Deconstruction). Supporters of these theoretical positions often make strong claims for the recognition of rights, but this is probably better seen as exploitation of the preconceptions of their opponents, rather than as recognition of universal ethical concepts and human freedom.

Other critiques of traditional ethics may, however, be more sympathetic to applied ethics. On the basis of research revealing the contextuality of many women's responses to ethical dilemmas, some feminist writers, most prominently Carol Gilligan (1982), have argued that women in general are likely to adopt an ethic of care and responsibility to particular others rather than an abstract morality of principles, rights or justice (see Feminist ethics §1). Such an approach may well seem better adapted to the resolution of 'hard cases' in, for example, health care or social work (see Nursing ethics).

Similarly, the approach known as 'virtue ethics', with its emphasis on seeking the good in particular situations, may seem well adapted to applied ethics, even if its proponents sometimes appear to view it in opposition, regarding their own stand as more objective, and wrongly equating applied ethics with subjectivism and relativism (see Virtue ethics).

Other stereotypes to be rejected are political: applied ethics has typically been associated with vegetarianism, pacifism, feminism and environmentalism. It should be noted, however, that it also includes criticism and evaluation of these positions: defences of meat-eating or animal experiments, scepticism about feminism, and resistance to new 'ecological ethics' are to be found alongside more orthodox publications on library shelves. There is nothing wrong with variety of opinion so long as this is within a broad ethical framework, for it is of the essence of applied philosophy in general to approach individual issues in their own right and not as part of an ideological package-deal.

Applied ethics, then, is part of a whole view of the human condition and takes a broad view of ethical decision-making. Essentially, this is ethical decision-making seen as practical policy that consciously recognizes the constraints of moral norms, rights and ethical principles capable of commanding universal respect. Where this is accepted, the object of applied ethics is plain: it is to gain clearer perceptions of right and wrong, with a view to embodying these insights in manners and institutions.

5 Historical context

The inception of applied philosophy could well be said to coincide with that of the Western philosophical tradition as a whole, for the first of the early Greek philosophers, Thales (*c*.585 BC), is recorded as having combined his speculative philosophical interests with economic acumen and an interest in legal and political reform. Later schools of philosophy in ancient times - Pythagoreans, Epicureans, Stoics - offered their followers principles for living and even indeed distinctive codes of practice.

For both Plato and Aristotle, ethical and political questions were posed in terms of such notions as the good for man, the ultimate good, or what is good in itself and for its own sake (see Plato §16; Aristotle §21). Their assumption was that this inquiry led both to a way of life for the individual, and to a conception of the good society. They disagreed about whether this would lead an individual necessarily to live according to the ethical insight thus gained, Aristotle, unlike Plato in his earlier writings, allowing for the intervention of weakness of will to divert the person who has recognized the good from pursuing it (see Akrasia).

Subsequent philosophers frequently applied their ethical assumptions to particular cases, and saw this, not as a way of fractionizing moral philosophy - making it the science of the particular - but as a route to formulating guiding principles. Aquinas treated a range of practical issues including marriage and the family in *Summa theologiae*, and this tradition was developed further by Suárez (1612-21) and Grotius (1625). Locke (1689) wrote on the issue of toleration, Kant (1785; 1797) on suicide and on the question of whether it is ever right to tell a lie from benevolent motives (see Locke, J. §7; Toleration §1; Suicide, ethics of §5). Bentham (1789) put forward a complex theory of punishment, even formulating plans for a new type of prison, to be called the ‘panopticon’. He also wrote on legal and political reform. Hegel’s philosophy included views on the family and on punishment.J.S. Mill’s writings on toleration, paternalism and feminism (1859) continue to be of interest in the present day, as the controversies involved in these areas remain subjects of disagreement and debate (see Feminism; Paternalism), and Dewey’s theories of education (1916) exercised enormous practical influence on education systems in the USA and Britain (see Education, history of philosophy of).

The tradition in moral philosophy unsympathetic to applied ethics is in fact of fairly recent origin. It was associated with the dominance of positivism and empiricism in the philosophy of science, and the vogue for linguistic analysis in epistemology. This is a twentieth-century phenomenon and, right up to the closing years of the nineteenth century, a more generous conception of ethics flourished. If a certain myopia on applied issues is recognized amongst philosophers in the English-speaking world, coinciding roughly with the first half of the twentieth century, various explanations may be offered for the gradual return of visual focus. For those with an interest in medical ethics, a research project in Tuskegee in the USA in which a control group with syphilis remained untreated for decades after safe treatment was known to be possible is often cited as a trigger generating widespread discussion of issues such as autonomy, beneficence and nonmaleficence, medical confidentiality, and the ethics of experiments on human subjects (see Medical ethics §§1-3). This case may have been, however, a symptom rather than a cause, for in general medicine moved during those decades from being a practice with little power to influence the natural course of disease, to being a powerful interventionist tool. Whatever the specific cause, then, from roughly this period medical ethics became an arena of critical and controversial discussion.

Again in the USA, the Vietnam War and the protests which it generated are cited as having promoted discussion of a different range of applied issues (civil disobedience, duty to conscience versus duty to society) and as having led in a fairly direct way to the setting up of the Society for Philosophy and Public Affairs and the journal *Philosophy and Public Affairs* (see Civil disobedience; Conscience).

Others, focusing on the applied philosopher’s interest in animal welfare, cite the publication of the volume *Animal Liberation* (1975) by Peter Singer as ushering in a new conception of ethics as a practical and possibly even campaigning area (see Animals and ethics §3). Already, too, Rachel Carson’s *Silent Spring* (1962) had alerted the general public to many environmental hazards and thus opened the way to an enlarged philosophical perspective in which developments in science and technology and the way in which these were applied by firms and governments to the environment were seen as matters of ethical concern. It was a decade or so later that the internal operations of businesses became matters for ethical scrutiny, prompted by scandals connected with sharp practices such as insider trading.

Finally, it must be said that philosophy itself no doubt provided a spur to the growth of applied ethics. The preoccupation of academic moral philosophy with entirely minor moral issues in a century which had witnessed

two world wars and many accompanying gross violations of human rights, was too remarkable to pass for long, particularly with wider access to higher education and hence to the hitherto elite and somewhat esoteric pursuit of philosophy.

This account of the rise of contemporary applied ethics raises the question of what kind of study applied ethics is. Is it merely another kind of academic study, or is it committed to the promotion of change in the world? Is it conservative or radical? Reactionary or revolutionary? The answer to this last question is that it can be either. Reflection may make one seek to promote change for the better, but it may also cause one to recoil from change and seek to preserve what is best from the past. The controversial nature of most of the issues involved is itself a spur to their philosophical study, for it is probably true to say that until recently, despite differences of religious or ideological background, a common moral approach could in general be assumed, and accepted norms of moral behaviour could be taken as a starting-point for ethical reasoning. Such moral consensus cannot now be presupposed, and, while absolutist approaches are by no means inconsistent with mainstream philosophical ethics, in practice the defence of an absolute conception of morality against relativistic, subjective and utilitarian approaches is often associated with a religious perspective.

Many writers on applied ethics, however, adopt a secular utilitarian stance. These include the Australian philosopher Peter Singer, and the Oxford philosopher Jonathan Glover, who has written especially in the area of medical ethics (see Utilitarianism). R.M. Hare, in *Moral Thinking* (1981), puts forward a prescriptivist theory which combines utilitarianism with Kantian universalizability (see Prescriptivism). Also influential is the ethic of care mentioned above, which is often linked to gender differences. Other views include those of the Australian philosopher John Passmore, who defends a liberal moral perspective, especially in relation to environmental ethics, and John Rawls, whose notion of reflective equilibrium combines intuitionism with contract theory (see Moral justification §2). Rawls' *A Theory of Justice* (1971) inaugurated a new more practical approach in ethics, which had implications for economics, law and political theory. Sissela Bok has written on the fine texture of issues in public life in *Lying: Moral Choices in Public and Private Life* (1978) and *Secrets* (1984) (see Truthfulness); Mary Midgley, in *Beast and Man* (1978) and elsewhere, has discussed the relations between humans and other species; and Onora O'Neill (1986) has brought a Kantian ethic to bear on the issues of famine and poverty (see Development ethics). The debate between communitarians and libertarians about the ethics of capitalism and the role of welfare can also be seen as a part of applied ethics (see Community and communitarianism; Market, ethics of the). The German philosopher, Jürgen Habermas, an influential figure both in continental Europe and the English-speaking world, has put forward a notion of consensus as the object of theory expressed in practice.

6 Professional ethics

Similar divisions may reveal themselves in professional ethics, although the idea that there should be special codes of ethics peculiar to particular professions has been current since ancient times, when the Hippocratic oath was required of those engaging in medical practice. Many modern groups, including engineers, nurses and lawyers, have adopted formal codes setting standards of ethical practice for their profession (see Professional ethics).

Ethics also plays an increasing role in the training of professionals. Often the preferred approach is through the use of case studies, sometimes fictional, sometimes using videos of actual cases. One problem with the case study approach is its possible negative effect. In stressing that there are at least two sides to many ethical problems, and in presenting ethical theories as giving conflicting outcomes, they may risk generating a facile moral or cultural relativism - the view that there are only opinions, not answers. The use of case studies and discussion based on situational ethics may also tacitly undermine principles (see Situation ethics). In contrast, some courses aim simply to increase the moral sensitivity of trainees, on the assumption that if this is successful they will go on to make good professional decisions (see Examples in ethics).

7 Are there ethical experts?

Applied ethics does not involve a claim of moral expertise, but often involves collaboration with specialists in practical areas in order to arrive at policy decisions that allow ethical considerations a determining role.

There is now wide acceptance of the principle of ensuring that a philosophical or ethical viewpoint is represented in certain kinds of forums, such as public enquiries, the reports of legislative committees or commissions of

inquiry, and hospital ethics committees. The USA has a President's Commission to report directly on bioethical issues to the US President, the UK has a National Bioethics Committee funded independently of government, while in France there is a French National Committee on Ethical Affairs in Public Debate. In 1985, the Council of Europe created a multidisciplinary body with experts appointed by each member country, now called the Comité Directeur de Bioéthique (CDBI). Canada set up a Royal Commission on New Reproductive Technologies, and the European Parliament commissions advice on scientific and technological policy options. Other countries are following a similar pattern. In addition, the Council of Europe in 1990 began working on a European Convention on biomedical ethics, which would be a legally binding instrument on all countries signing it, the object being ultimately to harmonize European legislation.

Individuals are also used as consultants on public policy issues. In Europe, Jonathan Glover, in collaboration with nationals of other European countries, produced a report on fertility and the family for the European Commission (1989), while Will Kymlicka has advised on this topic as a member of the Canadian Royal Commission and, in the USA, Arthur Caplan was a member of the President's Task Force on National Health Care Reform. In Britain, the philosopher Mary Warnock (1985) was responsible for official reports on the educational needs of children with disabilities and learning difficulties, and on new developments in reproductive medicine and embryology; Bernard Williams (1979) played a similar role in relation to pornography and censorship. The debate about euthanasia in the Netherlands has engaged philosophers, lawyers, and social theorists. Less happily, a visit by Peter Singer to Germany provoked widespread protest related to the debate on euthanasia and has led to the unpopularity of bioethics in some circles, and a general and unjustified rejection of applied ethics.

Some achievements in these areas may also be recorded; examination of the ethics of clinical trials, for example, particularly in relation to AIDS, led to a total reconceptualization of what clinical trials require, and to a multi-choice system being devised which is both scientifically acceptable and also allows a more acceptable level of choice to patients and physicians.

8 Research in applied ethics

In general, those who fund research regard the gathering of facts, often called the 'generation of new knowledge', as crucial; philosophy, in contrast, appears to involve reflection on facts, while normative philosophy generates proposals for action or policy. Applied ethics offers at its best an opportunity to combine these approaches: for facts to be made the fruitful object of analytic and morally sensitive reflection, and for philosophical inquiry to accept the discipline of the need to take account of the practical framework within which speculation is cast.

Research in applied ethics, then, ideally starts from a perceived problem and is motivated to find a solution to that problem. It is frequently interdisciplinary. A research programme is often inspired by technological progress, for it is this that has placed ethical considerations at the heart of many areas of public debate. Typical of these are the controversies already mentioned surrounding the new technologies of reproduction: embryo research, donation of gametes, surrogate motherhood, which raise questions about the status of the human embryo and the definition of parenthood (see Reproduction and ethics).

Other appropriate areas where ethics impinges on practical inquiry include, for example, the ethical implications of the Human Genome Project, the ethics of confidentiality, insurance in relation to AIDS or inherited disease, the care of the elderly, homelessness, and mental illness (see Genetics and ethics; Medical ethics §§4-5; Nursing ethics). One caveat to be noted here, however, is that simply gathering data about what people think is right is sociology, not ethics, applied or otherwise.

9 Institutions

Many research centres have been created in recent decades. Their function is usually to conduct research, to produce publications and to arrange lectures, seminars and conferences on practical issues of ethical concern.

North America has the best-established institutional network. First in the field was the Hastings Center, New York (1969), then the Center for Philosophy and Public Affairs, University of Maryland and the Center for the Study of Ethics in the Professions at the Illinois Institute of Technology (1976), the Center for the Study of Values, University of Delaware (1977), and the Social Philosophy and Policy Center, Bowling Green State University, Ohio (1981). There are now many other centres in universities in the USA and elsewhere, including, in the UK, the

Centre for Philosophy and Public Affairs at the University of St Andrews, the Centre for Medical Law and Ethics at King's College London, and the Social Values Research Centre at the University of Hull. The Netherlands has Bioethics Centres in Utrecht and Maastricht and work in applied ethics in the Scandinavian countries is increasing, with a strong interest in reproductive ethics in Aarhus, Denmark and in animal welfare issues in Copenhagen. The European Business Ethics Network (EBEN) began with an initiative from Switzerland, and business ethics is also well-established in Spain and Germany. Apart from university-based units, the Society for Applied Philosophy (1982) has general interests in most areas of applied ethics and has a broad membership not confined to professional philosophers.

Australia has been a pioneer in many fields of applied ethics: Peter Singer, together with Helga Kuhse, founded the Centre for Human Bioethics (1980) at Monash University, and there are now several other applied ethics centres in Australasia; it is worth noting the particular degree of interest there in environmental ethics, where the issues of species preservation, wilderness, and ecological threats such as damage to the ozone layer are of direct concern to residents.

The creation of a Chair of Environmental Ethics at Warsaw University represents the strong interest, partly political in origin, in environmental ethics in the former communist countries of Eastern Europe. Other countries where applied ethics is of growing interest are parts of Southeast Asia, including Thailand and Hong Kong, India, and several African countries.

Apuleius (*c.* AD 125-180)

The Latin writer Apuleius of Madaura was a professional rhetorician, a novelist and an amateur Platonist. His handbook of Platonism and his essay on the guardian spirit of Socrates are valuable sources on Middle Platonism. The handbook is comparable to that of his probable contemporary Alcinous, but covers only physics (including metaphysics) and ethics.

Apuleius was born in Madaura in North Africa, of respectable provincial family. He received the best rhetorical education available in Carthage and then, around AD 150, set out for Athens to study philosophy. It is possible that, when there, he studied with the Platonist Calvenus Taurus, whose lectures Aulus Gellius also attended, but we cannot be certain. None the less, Apuleius acquired in Athens a good working knowledge of Platonism, which he puts to various uses.

After more time in North Africa, he returned to practise as a lawyer and rhetorician in Carthage, where he was celebrated in an inscription of *c.* AD 161 as a rhetorician, poet and Platonic philosopher. At some time after this he composed his chief contribution to philosophy, a basic handbook, *On Plato and his Doctrine*, of a similar nature to that of the more-or-less contemporary text of Alcinous. This is written in a flat, scholastic style, very unlike that of his rhetorical compositions, so much so that its authenticity has been questioned, but without adequate grounds. Another philosophical treatise, probably also from this period, is his essay *On the Daemon of Socrates*; in florid, rhetorical style, it does however contain useful Middle Platonist doctrine on daemons.

On Plato is in two books, the first dealing with 'physics' (including metaphysics), the second with ethics and politics. A third section, devoted to logic, is envisaged in the preface, but there is no sign of it; instead, we have the (possibly spurious) *De interpretatione*. *On Plato* begins with four chapters on the life of Plato, which constitute valuable evidence for the state of the Plato myth in Apuleius' time. Thereafter, Apuleius embarks on a systematic survey of Platonic philosophy, beginning with the first principles God, Matter and the Ideas (chaps 5-6), and continuing through the topics of the formation of the elements and of the world, the soul of the world, time, the heavenly bodies, classification of animate beings, gods and daemons, and fate and free will. This is followed by an anthropological section, on the parts of the soul and the body, the senses and bodily health and disease. All of this, as with the parallel treatise of Alcinous, is heavily dependent on Plato's *Timaeus* (see Plato §16). Most distinctive, perhaps, is his doctrine of fate and providence (ch. 12), postulating three levels of providence, in which he shows interesting affinities with the pseudo-Plutarchan treatise *On Fate*.

Book II of *On Plato* covers the various main topics of ethical theory, followed by a discussion of the nature of the perfect sage, and a short disquisition on politics, again not differing greatly from Alcinous, and identifying Apuleius as an adherent of the Peripateticizing wing of Middle Platonism. As for the work *De interpretatione*, it gives a summary account of Aristotelian logic, reflecting later developments in the Peripatetic school

Apuleius was a man of many parts. He is best known today for his novel *The Golden Ass*. As a philosopher, he would make no great claim to originality, but he provides useful evidence for the state of Platonism in the mid second century AD.

JOHN DILLON

List of works

Apuleius (AD 158/9) *Apology*, ed. P. Vallette, Paris: Les Belles Lettres, 2nd edn, 1960. (With French translation.)

Apuleius (between AD 140 and 180) *On the Daemon of Socrates, On Plato and his Doctrine, On the World*, in J. Beaujeu (ed.) *Apulée, Opuscules philosophiques et fragments (Apuleius, Philosophical Minor Works and Fragments)*, Paris: Les Belles Lettres, 1973.(With French translation.)

Apuleius (between AD 140 and 180) *De interpretatione*, in D. Londrey and C. Johanson (eds) *The Logic of Apuleius*, Leiden: Brill, 1987.(In English translation with a useful logical commentary.)

Apuleius (between AD 140 and 180) *The Golden Ass* (or *Metamorphoses*), trans. J.A. Hanson, Cambridge, MA: Harvard University Press, 1989.(Of little interest philosophically, but notable as the only surviving novel in Latin.)

Aquinas, Thomas (1224/6-74)

Aquinas lived an active, demanding academic and ecclesiastical life that ended while he was still in his forties. He nonetheless produced many works, varying in length from a few pages to a few volumes. Because his writings grew out of his activities as a teacher in the Dominican order and a member of the theology faculty of the University of Paris, most are concerned with what he and his contemporaries thought of as theology. However, much of academic theology in the Middle Ages consisted in a rational investigation of the most fundamental aspects of reality in general and of human nature and behaviour in particular. That vast domain obviously includes much of what is now considered to be philosophy, and is reflected in the broad subject matter of Aquinas' theological writings.

The scope and philosophical character of medieval theology as practised by Aquinas can be easily seen in his two most important works, Summa contra gentiles (Synopsis [of Christian Doctrine] Directed Against Unbelievers) and Summa theologiae (Synopsis of Theology). However, many of the hundreds of topics covered in those two large works are also investigated in more detail in the smaller works resulting from Aquinas' numerous academic disputations (something like a cross between formal debates and twentieth-century graduate seminars), which he conducted in his various academic posts. Some of those topics are taken up differently again in his commentaries on works by Aristotle and other authors. Although Aquinas is remarkably consistent in his several discussions of the same topic, it is often helpful to examine parallel passages in his writings when fully assessing his views on any issue.

Aquinas' most obvious philosophical connection is with Aristotle. Besides producing commentaries on Aristotle's works, he often cites Aristotle in support of a thesis he is defending, even when commenting on Scripture. There are also in Aquinas' writings many implicit Aristotelian elements, which he had thoroughly absorbed into his own thought. As a convinced Aristotelian, he often adopts Aristotle's critical attitude toward theories associated with Plato, especially the account of ordinary substantial forms as separately existing entities. However, although Aquinas, like other medieval scholars of western Europe, had almost no access to Plato's works, he was influenced by the writings of Augustine and the pseudo-Dionysius. Through them he absorbed a good deal of Platonism as well, more than he was in a position to recognize as such.

On the other hand, Aquinas is the paradigmatic Christian philosopher-theologian, fully aware of his intellectual debt to religious doctrine. He was convinced, however, that Christian thinkers should be ready to dispute rationally on any topic, especially theological issues, not only among themselves but also with non-Christians of all sorts. Since in his view Jews accept the Old Testament and heretics the New Testament, he thought Christians could argue some issues with both groups on the basis of commonly accepted religious authority. However, because other non-Christians, 'for instance, Mohammedans and pagans - do not agree with us about the authority of any scripture on the basis of which they can be convinced... it is necessary to have recourse to natural reason, to which everyone is compelled to assent - although where theological issues are concerned it cannot do the whole job', since some of the data of theology are initially accessible only in Scripture (Summa contra gentiles I.2.11). Moreover, Aquinas differed from most of his thirteenth-century Christian colleagues in the breadth and depth of his respect for Islamic and Jewish philosopher-theologians, especially Avicenna and Maimonides. He saw them as valued co-workers in the vast project of philosophical theology, clarifying and supporting doctrine by philosophical analysis and argumentation. His own commitment to that project involved him in contributing to almost all the areas of philosophy recognized since antiquity, omitting only natural philosophy (the precursor of natural science).

A line of thought with such strong connections to powerful antecedents might have resulted in no more than a pious amalgam. However, Aquinas' philosophy avoids eclecticism because of his own innovative approach to organizing and reasoning about all the topics included under the overarching medieval conception of philosophical Christian theology, and because of his special talents for systematic synthesis and for identifying and skilfully defending, on almost every issue he considers, the most sensible available position.

1 Early years

Thomas Aquinas was born at Roccasecca, near Naples, the youngest son of a large Italian aristocratic family. As is

generally true of even prominent medieval people, it is hard to determine exactly when he was born; plausible arguments have been offered for 1224, 1225 and 1226. He began his schooling in the great Benedictine abbey at Monte Cassino (1231-9), and from 1239-44 he was a student at the University of Naples. In 1244 he joined the Dominican friars, a relatively new religious order devoted to study and preaching; by doing so he antagonized his family, who seem to have been counting on his becoming abbot of Monte Cassino. When the Dominicans ordered Aquinas to go to Paris for further study, his family had him abducted en route and brought home, where he was kept for almost two years. Near the end of that time his brothers hired a prostitute to try to seduce him, but Aquinas angrily chased her from his room. Having impressed his family with his high-minded determination, in 1245 Aquinas was allowed to return to the Dominicans, who again sent him to Paris, this time successfully.

At the University of Paris, Aquinas first encountered Albert the Great, who quickly became his most influential teacher and eventually his friend and supporter. When Albert moved on to the University of Cologne in 1248, Aquinas followed him there, having declined Pope Innocent IV's extraordinary offer to appoint him abbot of Monte Cassino while allowing him to remain a Dominican.

Aquinas seems to have been unusually large, and extremely modest and quiet. When during his four years at Cologne his special gifts began to be apparent, despite his reticence and humility, Albert assigned the still-reluctant Aquinas his first active part in an academic disputation. Having failed in his efforts to shake his best student's arguments on this occasion, Albert declared, 'We call him the dumb ox, but in his teaching he will one day produce such a bellowing that it will be heard throughout the world'.

In 1252 Aquinas returned to Paris for the course of study leading to the degree of master in theology, roughly the equivalent of a twentieth-century PhD. During the first academic year he studied and lectured on the Bible; the final three years were devoted to delivering in lecture form his commentary on Peter Lombard's *Sentences*, a standard requirement for the degree at that time (see Lombard, P.). Produced in 1253-6, Aquinas' massive commentary (often referred to as the *Scriptum super libros Sententiarum (Commentary on the Sentences)* is the first of his four theological syntheses. It contains much valuable material, but because it is superseded in many respects by his great *Summa contra gentiles (Synopsis [of Christian Doctrine] Directed Against Unbelievers)* and *Summa theologiae (Synopsis of Theology)* the *Scriptum* has not yet been studied as much as it should be.

During that same four-year period, Aquinas produced *De ente et essentia (On Being and Essence)*, a short philosophical treatise written for his fellow Dominicans at Paris. Although it owes something to Avicenna's *Metaphysics*, *De ente* is distinctively Aquinas' own, expounding many of the concepts and theses that remained fundamental to his thought throughout his career (see §9 below).

2 First Paris regency

In the spring of 1256, Aquinas was appointed regent master (professor) in theology at Paris, a position he held until the end of the academic year 1258-9. *Quaestiones disputatae de veritate (Disputed Questions on Truth)* is the first of his sets of disputed questions and the most important work he produced during those three years. It grew out of his professorship, which obliged him to conduct several formal public disputations each year. *Quaestiones disputatae de veritate* consists of twenty-nine widely ranging Questions, each devoted to some general topic such as conscience, God's knowledge, faith, goodness, free will, human emotions and truth (the first Question, from which the treatise gets its name). Each Question is divided into several Articles, and the 253 articles are the work's topically specific units: for example, q. 1, a. 9 is 'Is there truth in sense perception?'

The elaborate structure of each of those articles, like much of Aquinas' writing, reflects the 'scholastic method', which, like medieval disputations in the classroom, had its ultimate source in Aristotle's recommendations in his *Topics* regarding cooperative dialectical inquiry. Aquinas' philosophical discussions in that form typically begin with a yes/no question. Each article then develops as a kind of debate. It begins with arguments for the answer opposed to Aquinas' own position; these are commonly, if somewhat misleadingly, called 'objections'. Next come the arguments *sed contra* (but, on the other hand), which are in later works often reduced to a single citation of some generally accepted authority on Aquinas' side of the issue. The *sed contra* is followed by Aquinas' reasoned presentation and defence of his position. This is the master's 'determination' of the question, sometimes called the 'body' of the article (indicated by 'c' in references). An article normally concludes with Aquinas' rejoinders to each of the objections (indicated by 'ad 1', and so on, in references).

Conducting 'disputed questions' was one of the duties of a regent master in theology, but the theology faculty also provided regular opportunities for 'quodlibetal questions', occasions on which a master could, if he wished, undertake to provide replies to any and all questions proposed by members of the academic audience. These occasions were scheduled, for the master's own good, during the two penitential seasons of the church year. Aquinas seems to have accepted this challenge on at least five of the six such occasions occurring during his first regency at Paris, producing *Quaestiones quodlibetales (Quodlibetal Questions)* in which he offers his considered judgment on issues ranging from whether the soul is to be identified with its powers to whether the damned behold the saints in glory.

Aquinas' commentaries on Boethius' *De trinitate (On the Trinity)* and *De hebdomadibus* (sometimes referred to as 'How Substances are Good') are his other philosophically important writings from this period of his first regency. Although several philosophers had commented on those Boethian treatises in the twelfth century, the subsequent influx of Aristotelian works had left them almost universally disregarded by the time Aquinas wrote his commentaries (see Aristotelianism, medieval; Boethius, A.M.S.). No one knows why or for whom he wrote them, but he might well have undertaken these studies for his own edification on topics that were then becoming important to his thought. The *De trinitate* commentary (*Expositio super librum Boethii De trinitate*) presents Aquinas' views on the relationship of faith and reason and on the methods and interrelations of all the recognized bodies of organized knowledge, or 'sciences'. Boethius' *De hebdomadibus* is the *locus classicus* for the medieval consideration of the relation between being and goodness. Dealing with this topic in his commentary on that treatise, Aquinas also produced his first systematic account of metaphysical participation, one of the important Platonist elements in his thought. Participation, he claims, obtains when the metaphysical composition of something includes, as one of the thing's metaphysical components, *X*, which also belongs, to something else that is *X* in its own right in a way that is presupposed by the first thing's having *X*. In this way a running man participates in running, human being participates in animal, and an effect participates in its cause (see also §9 below) (see Platonism, medieval).

3 Naples and Orvieto: *Summa contra gentiles* and biblical commentary

Aquinas' activities between 1259 and 1265 are not well documented, but he seems definitely to have left his professorship at Paris at the end of the academic year 1258-9. He probably spent the next two years at a Dominican priory in Naples, working on the *Summa contra gentiles*, which he had begun in Paris and which he subsequently finished in Orvieto where, as lector, he was in charge of studies at the Dominican priory until 1265.

Summa contra gentiles is unlike Aquinas' three other theological syntheses in more than one respect. Stylistically, it is unlike the earlier *Scriptum* and the later *Summa theologiae* in not following the scholastic method; instead, it is written in ordinary prose divided into chapters, like his *Compendium theologiae (Compendium of Theology)* which he seems to have written immediately afterwards (1265-7). More importantly, the *Scriptum*, *Summa theologiae* and the *Compendium* are all contributions to revealed theology, which essentially includes the data of revelation among the starting points of its theorizing. In *Summa contra gentiles*, on the other hand, Aquinas postpones revealed theology to the last (fourth) book, in which he deals with the 'mysteries', the few doctrinal propositions that cannot be arrived at by natural reason alone and that have their sources in revelation only; and he takes these up with the aim of showing that even those propositions 'are not opposed to natural reason' (*Summa contra gentiles* IV.1.3348). He devotes the first three books to fully developing a natural theology, dependent on natural reason of course, but independent of revelation. As developed in Books I-III, this natural theology is able to accomplish a very large part of theology's job, from establishing the existence of God through working out details of human morality (see also §13 below).

Discussions important for understanding Aquinas' positions in many areas of philosophy are also scattered, not always predictably, among interpretations of the text in his biblical commentaries. During Aquinas' stay in Orvieto and around the time he was writing Book III of *Summa contra gentiles*, on providence and God's relations with human beings, he also produced his *Expositio super Iob ad litteram (Literal Commentary on Job)*, one of the most fully developed and philosophical of his biblical commentaries, rivalled in those respects only by his later commentary on Romans. The body of the Book of Job consists mainly of the speeches of Job and his 'comforters'. Aquinas sees those speeches as constituting a genuine debate, almost a medieval academic disputation (determined in the end by God himself), in which the thought develops subtly, advanced by arguments. His construal of the

argumentation is ingenious, the more so because twentieth-century readers have tended to devalue the speeches as tedious reiterations of misconceived accusations countered by Job’s slight variations on the theme of his innocence.

Aquinas’ interpretation of the book’s subject is also unlike the modern view, which supposes it to be the biblical presentation of the problem of evil, raised by a good God’s permitting horrible suffering to be inflicted on an innocent person. Aquinas seems scarcely to recognize that Job’s story raises doubts about God’s goodness. As he interprets it, the book explains the nature and operations of divine providence, which he understands as compatible with permitting bad things to happen to good people. As Aquinas sees it:

> If in this life people are rewarded by God for good deeds and punished for bad, as Eliphaz [one of the comforters] was trying to establish, it apparently follows that the ultimate goal for human beings is in this life. But Job means to rebut this opinion, and he wants to show that the present life of human beings does not contain the ultimate goal, but is related to it as motion is related to rest, and a road to its destination.
>
> (*Expositio super Iob ad litteram* 7: 1-4)

The things that happen to a person in this life can be explained in terms of divine providence only by reference to the possibility of that person’s achieving the ultimate goal of perfect happiness, the enjoyment of union with God in the afterlife.

In discussing Job’s lament that God doesn’t hear his prayers, Aquinas says that Job has that impression because God sometimes ‘attends not to a person’s pleas but rather to his advantage. A doctor does not attend to the pleas of the invalid who asks that the bitter medicine be taken away (supposing that the doctor doesn’t take it away because he knows that it contributes to health). Instead, he attends to the patient’s advantage; for by doing so he produces health, which the sick person wants most of all.’ In the same way, God sometimes permits a person to suffer despite prayers for deliverance, because he knows that those sufferings are helping that person achieve what he or she wants most of all (*Expositio super Iob ad litteram* 9:16).

4 Rome: disputed questions, Dionysius and the *Compendium*

In 1265 Aquinas went from Orvieto to Rome, having been appointed to establish a Dominican *studium* (something like a twentieth-century college) and to serve as regent master there. This Roman period of his career, which lasted until 1268, was particularly productive. Some of his major works dating from 1265-8 are just what would have been expected of a regent master in theology, in particular, three sets of disputed questions, *Quaestiones disputatae de potentia (Disputed Questions on [God’s] Power)*, *Quaestio disputata de anima (Disputed Question on the Soul)* and *Quaestio disputata de spiritualibus creaturis (Disputed Question on Spiritual Creatures)*. In the earliest of these, *De potentia*, there are eighty-three Articles grouped under ten Questions; the first six questions are on divine power, while the final four are on problems associated with combining the doctrine of Trinity with God’s absolute simplicity. The much shorter *De anima* is concerned mainly with metaphysical aspects of the soul, concluding with some special problems associated with the nature and capacities of souls separated from bodies (Articles 14-21). The eleven articles of *De spiritualibus creaturis* again address many of those same concerns but also go on to some consideration of angels as another order of spiritual creatures besides human beings, whose natures are only partly spiritual.

During this same period, or perhaps while he was still at Orvieto, Aquinas wrote a commentary on the pseudo-Dionysian treatise *De divinis nominibus (On the Divine Attributes)*, a deeply Neoplatonist account of Christian theology dating probably from the sixth century. Aquinas, like everyone else at the time, believed that it had been written in the apostolic period by the Dionysius who had been converted by St Paul. For that reason, and perhaps also because he had first studied the book under Albert at Cologne, it had a powerful influence on Aquinas’ thought. Very early in his career, while he was writing his *Scriptum*, he thought Dionysius was an Aristotelian (*Scriptum* II, d.14, q.1, a.2), but while writing the commentary on this text he realized that its author must have been a Platonist (*Expositio super librum Dionysii De divinis nominibus*, prooemium; *Quaestiones disputatae de malo* 16.1, ad 3). His commentary, which makes clear sense of a text that is often obscure, may, like his commentaries on Boethius, have been written for his own purposes rather than growing out of a course of lectures. In any case, his study of Dionysius is one of the most important routes by which Platonism became an essential ingredient in his own thought (see also Pseudo-Dionysius).

The *Compendium theologiae (Compendium of Theology)*, already mentioned in connection with *Summa contra gentiles*, was once thought to have been written much later and to have been left incomplete because of Aquinas' death. However, its similarity to *Summa contra gentiles* not only in style but also in content has lately led many scholars to assign it to 1265-7. Among Aquinas' four theological syntheses, the *Compendium theologiae* is unique in the brevity of its discussions and in having been organized around the 'theological virtues' of faith, hope and charity. Had it been completed, it might have provided a novel reorientation of the vast subject matter of medieval theology, but Aquinas wrote only ten short chapters of the second section, on Hope, and none at all of the third section, on Charity. He did complete the first section on Faith, but since most of the 246 chapters in the section simply provide much briefer treatments of almost all the theological topics Aquinas had already dealt with in *Summa contra gentiles*, the *Compendium* as he left it seems important mainly as a precis of material that is developed more fully in the other work (and in *Summa theologiae*).

5 Rome: Aristotelian commentary

While some of Aquinas' prodigious output in Rome from 1265-8 is, broadly speaking, similar to work he had already done, it also includes two important innovations, one of which is the first of his twelve commentaries on works of Aristotle. At the beginning of this commentary on *De anima* (*Sententia super De anima*), his approach is still a little tentative and (for Aquinas) unusually concerned with technical details. These features of the work once led scholars to describe the commentary on the first book of *De anima* as a *reportatio* (an unedited set of notes taken at his lectures), or even to ascribe this first third of Aquinas' commentary to another author. However, Gauthier (1984: *275-82) has argued persuasively that the difference between the commentary's treatments of Book I and of Books II and III of *De anima* is explained by differences between the books themselves, and that in fact none of Aquinas' commentaries on Aristotle resulted from lectures he gave on those books. Discrepancies within this work, the first of Aquinas' Aristotelian commentaries, are likely to be at least in part a consequence of the fact that he was finding his way into this new sort of enterprise, at which he quickly became very adept. In a recent volume of essays on Aristotle's *De anima*, Martha Nussbaum describes Aquinas' work as 'one of the very greatest commentaries on the work' and 'very insightful' (Nussbaum 1992: 3-4). T.H. Irwin, a leading interpreter of Aristotle, acknowledges that at one point in the *Sententia libri Ethicorum (Commentary on Aristotle's Nicomachean Ethics)* Aquinas 'actually explains Aristotle's intention more clearly than Aristotle explains it himself' (Irwin 1992: 467). Such judgments apply pretty generally to Aquinas' Aristotelian commentaries, all of which are marked by his extraordinary ability as a philosophical commentator to discern a logical structure in almost every passage he examines in every sort of text: not only Aristotle's but also those of others, from Boethius to St Paul.

Since commenting on Aristotle was a regular feature of life for a member of a medieval arts faculty but never part of the duties of an academic theologian, Aquinas' many Aristotelian commentaries were technically extra-curricular and therefore an especially impressive accomplishment for someone who was already extremely busy. Some scholars, admiring Aquinas' achievements in general but focusing on the fact that his professional career was entirely in the theology faculty, have insisted on classifying only the Aristotelian commentaries as philosophical works. Certainly these commentaries are philosophical, as purely philosophical as the Aristotelian works they elucidate. However, Aquinas wrote these commentaries not only to make good philosophical sense of Aristotle's very difficult texts but also, and more importantly, to enhance his own understanding of the topics Aristotle had dealt with. As he remarks in his commentary on *De caelo*, 'the study of philosophy has as its purpose to know not what people have thought, but rather the truth about the way things are' (*Sententia super libros De caelo et mundo* I.22.228), and he believed that the theologian's attempt to understand God and everything else in relation to God was the fundamental instance of the universal human drive to know the truth about the way things are. Moreover, his view of the best way of making intellectual progress in general looks very much like the age-old method of philosophy: ' But if any people want to write back against what I have said, I will be very gratified, because there is no better way of uncovering the truth and keeping falsity in check than by arguing with people who disagree with you' (*De perfectione spiritualis vitae* 26) (see Aristotelianism, medieval; Aristotle; Aristotle Commentators).

6 Rome: *Summa theologiae*

The other important innovation from Aquinas' three-year regency in Rome is *Summa theologiae*, his greatest and

most characteristic work, begun in Rome and continued through the rest of his life. *Summa theologiae*, left incomplete at his death, consists of three large Parts. The First Part (Ia) is concerned with the existence and nature of God (Questions 1-43), creation (44-9), angels (50-64), the six days of creation (65-74), human nature (75-102) and divine government (103-19). The Second Part deals with morality, and in such detail that it is itself divided into two parts. The first part of the Second Part (IaIIae) takes up human happiness (Questions 1-5), human action (6-17), the goodness and badness of human acts (18-21), passions (22-48) and the sources of human acts: intrinsic (49-89) and extrinsic (90-114). The second part of the Second Part (IIaIIae) begins with the three theological virtues and corresponding vices (Questions 1-46), goes on through the four 'cardinal virtues' and corresponding vices (47-170) and ends with special issues associated with the religious life (171-89). In the Third Part, Aquinas deals with the incarnation (Questions 1-59) and the sacraments (60-90), breaking off in the middle of his discussion of penance.

Aquinas thought of *Summa theologiae* as a new kind of textbook of theology, and its most important pedagogical innovation, as he sees it, is in its organization. He says he has noticed that students new to theology have been held back in their studies by several features of the standard teaching materials, especially 'because the things they have to know are not imparted in an order appropriate to a method of teaching': an order he proposes to introduce. It may well have been his enthusiasm for this new approach that led him to abandon work on his quite differently organized *Compendium theologiae*, and his natural preoccupation during this period with the writing of *Summa theologiae* Ia may also help to account for the fact that his other work of that time shows a special interest in the nature and operations of the human soul, the subject matter of Questions 75-89 of Ia (see §13 below).

7 Second Paris regency

In 1268 the Dominican Order again assigned Aquinas to the University of Paris, where he was regent master for a second time until, in the spring of 1272, all lectures at the university were canceled because of a dispute with the bishop of Paris. The Dominicans then ordered Aquinas to return to Italy.

Among the astounding number of works Aquinas produced in those four years is the huge Second Part of *Summa theologiae* (IaIIae and IIaIIae), nine Aristotelian commentaries, a commentary on the pseudo-Aristotelian *Liber de causis* (which, as Aquinas was the first to realize, is actually a compilation of Neoplatonic material drawn from Proclus), sixteen biblical commentaries and seven sets of disputed questions (including the set of sixteen *Quaestiones disputatae de malo (Disputed Questions On Evil)*, the sixth of which provides his fullest discussion of free choice). His literary productivity during this second regency is the more amazing because he was at the same time embroiled in various controversies.

Sending Aquinas back to Paris in 1268 seems to have been, at least in part, his order's response to the worrisome movement of 'Latin Averroism' or 'radical Aristotelianism', then gaining ground among members of the arts faculty who were attracted to interpretations of Aristotle found in the commentaries of Averroes (see Averroism). However, only two of his many writings from these years seem to have obvious connections with the Averroist controversy. One of these, his treatise *De unitate intellectus, contra Averroistas (On [the Theory of] the Unicity of Intellect, against the Averroists)* is an explicit critique and rejection of a doctrine distinctive of the movement; the theory, as Aquinas describes it, that the aspect of the human mind 'that Aristotle calls the possible intellect… is some sort of substance separate in its being from the body and not united to it in any way as its form; and, what is more, that this possible intellect is one for all human beings' (*De unitate intellectus*, prooemium). After briefly noting that this view's incompatibility with Christian doctrine is too obvious to warrant discussion at any length, Aquinas devotes the entire treatise to showing that 'this position is no less contrary to the principles of philosophy than it is to the teachings of the Faith', and that it is even 'entirely incompatible with the words and views' of Aristotle himself (*De unitate intellectus*, prooemium).

Besides the unicity of intellect, the other controversial theory most often associated with thirteenth-century Averroism is the beginninglessness of the universe. In many of his works Aquinas had already considered the possibility that the world had always existed, skilfully developing and defending the bold position that revelation alone provides the basis for believing that the world began to exist, that one cannot prove either that the universe must or that it could not have begun, and that a world both beginningless and created is possible (although, of course, not actual). The second of Aquinas' Parisian treatises that is plainly relevant to Averroism is *De aeternitate mundi, contra murmurantes (On the Eternity of the World, against Grumblers)*, a very short, uncharacteristically

indignant summary of his position. Aquinas could not complain that Aristotle had been misinterpreted regarding the eternity of the world; after initially supposing this to be the case, he had become convinced that Aristotle really did think he had proved that the world must have existed forever. Aquinas' position on this issue did not distance him enough from the Averroists in the view of their contemporary 'Augustinian' opponents, most notably the Franciscans Bonaventure and Pecham. In fact, the 'Grumblers' against whom Aquinas directed this treatise were probably not so much the Averroists in the arts faculty as those Franciscan theologians who maintained that they had demonstrated the impossibility of a beginningless world (see Augustinianism; Eternity of the world, medieval views of).

Aquinas' principled dissociation from some important Franciscans on this point must have helped to make his second Paris regency much more troubled than his first. In disputations conducted in Paris in 1266-7, the Franciscan master William of Baglione implicated Aquinas' views in the propositions he attacked, claiming that things Aquinas was saying encouraged the two heretical Averroist theses denounced by Bonaventure, namely the eternity of the world and the unicity of the intellect. 'The "blind leaders of the blind" decried by William evidently include Thomas as their chief' (Tugwell 1988: 226). It has also been persuasively argued that Aquinas' *De aeternitate mundi* was directed in particular against his Franciscan colleague in theology, John Pecham (Brady 1974). It seems, then, that Aquinas' development of a distinctly philosophical theology - which, like Albert's, was more Aristotelian than Augustinian - was dividing him from his colleagues in the Paris faculty of theology during these years. It may also have been bringing him closer to the philosophers in the arts faculty.

8 Last days

In June 1272 the Dominicans ordered Aquinas to leave Paris and go to Naples, where he was to establish another studium for the order and to serve as its regent master. Except for some interesting collections of sermons (originally preached in his native Italian dialect), the works dating from this period - two Aristotelian commentaries and the Third Part of *Summa theologiae* - were left unfinished. On or about 6 December 1273, while he was saying mass, something happened to Aquinas that left him weak and unable to go on writing or dictating. He himself saw the occasion as a special revelation. When Reginald of Piperno, his principal secretary and longtime friend, tried to persuade him to return to work on the Third Part of *Summa theologiae*, he said, 'Reginald, I can't.' And when Reginald persisted, Aquinas finally said, 'Everything I've written seems like straw by comparison with what I have seen and what has been revealed to me'. He believed that he had at last clearly seen what he had devoted his life to figuring out and, by comparison, all he had written seemed pale and dry. Now that he could no longer write, he told Reginald, he wanted to die. Soon afterwards he did die, on 7 March 1274 at Fossanuova, Italy, on his way to the Council of Lyons, which he had been ordered to attend.

9 Metaphysics

Every part of Aquinas' philosophy is imbued with metaphysical principles, many of which are recognizably Aristotelian. Consequently, concepts such as potentiality and actuality, matter and form, substance, essence, accident and the four causes - all of which are fundamental in Aquinas' metaphysics - should be considered in their original Aristotelian context (see Aristotle §11). He invokes such principles often, and he employs them implicitly even more often. Two of his earliest writings - *De principiis naturae (On the Principles of Nature)* and especially *De ente et essentia (On Being and Essence)* - outline much of his metaphysics, almost as if they had been designed to provide guidelines for the development of his philosophy. Perhaps the most important thesis argued in *De ente* is the one that became known as 'the real distinction', Aquinas' view that the essence of any created thing is really, not just conceptually, distinct from its existence. Metaphysically speaking, corporeal beings are composites of form and matter, but all creatures, even incorporeal ones, are composites of essence and existence. Only the first, uncreated cause, God, whose essence is existence, is absolutely simple.

Except for his commentary on Aristotle's *Metaphysics*, Aquinas devoted no mature treatise to metaphysics itself. However, since he considers metaphysics to be the science of being considered generally (*ens commune*), and since he argues that being itself is first of all God himself and that all being depends on God, his philosophy does begin with metaphysics insofar as the most systematic presentations of his thought (in *Summa contra gentiles* and *Summa theologiae*) start with the investigation of God-in-himself considered as the foundation of the nature and existence of everything (see for example, *Summa contra gentiles* III.25; *Expositio super librum Boethii De trinitate* V.4, VI.1; §14 below).

Being, Aquinas says, is intellect's most fundamental conception, 'inherently its most intelligible object and the one in which it finds the basis of all conceptions…. Consequently all of intellect's other conceptions must be arrived at by adding to being… insofar as they express a mode of being which is not expressed by the term "being" itself' (*Quaestiones disputatae de veritate* 1.1c). There are, he claims, just two legitimate ways of making such additions. The first results in the ten Aristotelian Categories, each of which is a 'specified [or specific] mode of being' - substance, quantity, quality and the rest. The results of 'adding to being' in the second way are less familiar. Aquinas takes them to be five modes of being that are entirely general, characterizing absolutely every being. That is, being, wherever and however instantiated, exhibits these five modes, which transcend the Categories because they are necessary modes of all specified being: thing (*res*), one, something (*aliquid*), good, true. These five, together with being itself, are the 'transcendentals', predicable correctly (if sometimes a little oddly) of absolutely anything that is. 'Good' and 'true' are the philosophically interesting cases, because some beings are obviously not good and because 'true' seems applicable only to propositions.

The claim that all beings are true depends on taking 'true' in the sense of 'genuine', as in 'true friend', a sense that had been explored in detail by Anselm of Canterbury. In Anselm's view, any being is true in this sense to the extent to which it agrees with the divine idea of such a thing (and is otherwise false, but only to some extent). Absolutely every thing that is agrees to some extent with the divine idea that is an ingredient in its causal explanation. Propositions are true if they correspond to the way things are in the world; things in the world are true if they correspond to what is in the mind, God's mind first, ours derivatively. So, Aquinas says, 'in the soul there is a cognitive and an appetitive power. The word "good", then, expresses the conformity of a being to appetite (as is said at the beginning of the *Ethics*: "The good is what all desire"). The word "true", however, expresses the conformity of a being to intellect' (*Quaestiones disputatae de veritate* 1.1c).

The central thesis of Aquinas' meta-ethics grows out of this theory of the transcendentals. The thesis is the metaphysical principle that the terms 'being' and 'good' are the same in reference, differing only in sense (*Summa theologiae* Ia.5.1). What all desire is what they take to be the good, and what is desired is at least perceived as desirable (see for example, *Summa contra gentiles* I.37; III.3). Desirability is thus an essential aspect of goodness. If a thing of a certain kind is genuinely desirable as a thing of that kind, it is desirable to the extent to which it is perfect of that kind: a complete specimen, free from relevant defect. But a thing is perfect of its kind to the extent to which it has actualized its specifying potentialities, the potentialities that differentiate its species from other species in the same genus. So, Aquinas says, a thing is desirable as a thing of its kind and hence good of that kind to the extent to which it is actualized and in being (*Summa theologiae* Ia.5.1). Generally, then, 'being' and 'goodness' have the same referent: the actualization of specifying potentialities. The actualization of a thing's specifying potentialities to at least some extent is on the one hand its existence as such a thing; it is in this sense that the thing is said to have being. However on the other hand, the actualization of a thing's specifying potentialities is, to the extent of the actualization, that thing's being whole, complete, free from defect: the state all things are naturally aimed at. It is in this sense that the thing is said to have goodness (see for example *Summa theologiae* IaIIae.1.5; 94.2; *Summa contra gentiles* III.3; *Quaestiones disputatae de veritate* 21.1-2.)

Aquinas' concept of analogy is important to his thought, though perhaps not so important as it has sometimes been made to seem. It is often presented, correctly, in terms of analogical predication. However, his concept of analogy can be explained at a more fundamental level in connection with causation. Setting aside 'accidental' causation - for example, a gardener's uncovering buried treasure - Aquinas thinks that efficient causation always involves an agent (*A*), a patient (*P*), and a form (*f*). In non-accidental efficient causation, *A* antecedently has *f*, somehow. *A*'s exercising causal power on *P* brings about *f* in *P*, *somehow*. Thus the efficient cause is *A*'s acting (or exercising a power it has), and the effect is *P*'s having *f*. The fact that *A* and *P* can have *f* in several different ways is what is brought out in '*somehow*'. The paradigm - straightforward efficient causation - is the kind Aquinas calls *univocal*: cases in which first *A* and then *P* have *f* in just the same way, and in which *f* can therefore be predicated truly of each in just the same sense. The metal hotplate and the metal kettle bottom resting on it are both called hot univocally: the form heat in these two causally related objects is the same specifically and differs only numerically.

However, Aquinas also recognizes two kinds of non-univocal efficient causation. The first, *equivocal* causation, characterizes cases in which there is no obvious respect in which to say that the *f* effected in *P* is found

antecedently in *A*, and yet there is a natural causal connection (as there standardly is an etymological explanation for equivocal predication). If *A* is solar power and its effect is the hardening (*f*) of some clay (*P*), then obviously the sun's power is not itself hard, as the clay is. To say what it is about solar power that hardens clay will not be as easy as explaining the heating of the kettle, and yet the hardening of the clay must, somehow, be brought about by that power. In such a case, *A* has *f* only in the sense that *A* has the power to bring about *f* in *P*.

Second, *analogical* causation occurs when, for instance, a blood sample (*P*) is correctly labelled 'anaemic', although of course the blood itself doesn't have anaemia and cannot literally be anaemic. The physiology of the sample's donor (*A*) brings about a condition (*f*) in the sample that is an unmistakeable sign of anaemia in *A*, thus justifying that (analogical) labeling of the sample. For theological purposes, Aquinas is interested not in natural analogical causation but rather in the artificial kind: the kind that involves ideas and volitions, the artisan's kind. 'In other agents [the form of what is to be brought about occurs antecedently] in keeping with *intelligible* being, as in those agents that act through intellect - the way a likeness of the house exists antecedently in the builder's mind' (*Summa theologiae* Ia.15.1c). Since the status of entirely univocal causation depends on there being a merely numerical difference between the *f* in *A* and the *f* in *P*, an intellective agent effecting its ideas is obviously not a univocal cause. But neither is this difference between the antecedent *f* and the consequent *f* so wide as to constitute equivocal causation. In fact, the kind of association between the idea and its external manifestation is closer than the kind found in natural analogical causation; and since, in Aquinas' view, 'the world was brought about not by chance but by God acting through intellect… it is necessary that there be a form in the divine mind, a form in the likeness of which the world was made' (*Summa theologiae* Ia.15.1c). God, then, is the non-univocal, non-equivocal, intellectively analogical efficient cause of the world (see Causation; God, concepts of).

10 Philosophy of mind

Aquinas' philosophy of mind is part of his more general theory of soul, which naturally makes use of his metaphysics. Obviously he is not a materialist - most obviously because God, the absolutely fundamental element of his metaphysics, is in no way material. Aquinas classifies every thing other than God as either corporeal or incorporeal (spiritual); he sometimes calls purely spiritual creatures - such as angels - 'separated substances' because of their essential detachment from body of any sort. However, this exhaustive division is not perfectly exclusive because human beings, simply by virtue of the human soul, must be classified not as simply corporeal but also as spiritual in a certain respect.

Merely having a soul of some sort is not enough to give a creature a spiritual component, however. Every animate creature has a soul (*anima*) - 'soul is what we call the first principle of life in things that live among us' (*Summa theologiae* Ia.75.1c) - but neither plants nor nonhuman animals are in any respect spiritual. Aquinas holds that even the merely nutritive soul of a plant, or the nutritive + sensory soul of a beast, is like the soul of a human being in being the *form* of a body. No soul, no first principle of life, can be *matter*. On the other hand, any vegetable or animal body has the life it has only in virtue of being a body whose special organization confers on it natural potentialities: that is, in virtue of the substantial form that makes it actually be such a body. Therefore, the first principle of life in a living non-human body, its soul, is no bodily part of that body but is rather its form, one of the two metaphysical components of the composite of matter and form that every body is. For plants and beasts, unlike humans, the form that is the soul goes out of existence when the composite dies, and it is in that sense that the souls of plants and beasts are not spiritual.

Only the soul of a human being is analysed as nutritive + sensory + *rational*. Aquinas thinks of this soul not as three nested, cooperating forms, but as the single substantial form that gives a human being its specifically human mode of existence. (In defending this thesis of 'the unicity of substantial form', Aquinas differed from most of his contemporaries.) He often designates this entire substantial form by its distinctively human aspect of rationality. He also thinks that the human soul, unlike the souls of plants and beasts, is subsistent: that is, it continues to exist after separating from the body in death. He says, for example: 'It is necessary to say that that which is the principle of intellective activity, what we call the soul of a human being, is an incorporeal, subsistent principle' (*Summa theologiae* Ia.75.2c). The human soul, just because it is distinctively mind (the principle of intellective activity), must therefore be described not only as incorporeal but also as subsistent.

It may seem impossible for Aquinas' account to accommodate the claim that souls persist and engage in mental acts after the death of the body. If the separated soul is a form, what is it a form of? Aquinas is not a universal

hylomorphist; unlike some of his contemporaries, he does not think that there is ‘spiritual matter’ that angels or disembodied souls have as one of their components, but rather that they are separated forms that configure no matter at all. Thus when he claims that the soul exists apart from the body, he seems to be holding the view that there can be a form with nothing of which it is the form. Moreover, Aquinas thinks that an angel or the soul separated from the body engages in mental activity. However, a form seems not to be the sort of thing that enages in acts of any sort, and so it appears that even if there were some way to explain the existence of the soul apart from the body, its acting could not be explained.

In this connection, it is helpful to examine Aquinas’ broader view of form. The world is ordered metaphysically in such a way that at the top of the universal hierarchy there are forms - God and angels - that are not forms *of* anything. Near the bottom of the hierarchy are forms that configure matter but cannot exist in their own right, apart from the corporeal composites they inform. The forms of inanimate things and of animate, non-rational things are of that sort. Those forms inform matter, but when the resultant composites cease to exist, those forms also cease to exist. In the middle - ‘on the borderline between corporeal and separated [that is, purely spiritual] substances’ - are human souls, the metaphysical amphibians (*Quaestio disputata de anima* 1c). Like angels, human souls are subsistent, able to exist on their own; but, like the forms of inanimate things, human souls configure matter.

Seeing the soul in this light helps to explain some of what is initially puzzling in Aquinas’ account. The human soul has a double character. On the one hand, unlike the forms of other material things, it is created by God as an individual entity in its own right, able to exist by itself as do purely immaterial angels. On the other hand, like the form of any corporeal thing, it exists in the composite it configures, and it comes into existence only with that composite, not before it (see Soul, nature and immortality of the).

11 Theory of knowledge

Nature, Aquinas thinks, must be arranged so as to enable human beings in general to satisfy their natural desire to know (*Sententia super Metaphysicam* I.1.3-4). His view of the arrangement actually provided seems at first too tight to be true, involving some sort of formal identity between the extra-mental object (*O*) and the cognizing faculty (*F*) in its actually cognizing *O*. However, Aquinas takes that (Aristotelian) identity-claim to mean only that the form of *O* is somehow *in F* (*Summa theologiae* Ia.85.2, ad 1). *O*’s form comes to be in *F* when *F* receives *species*, either sensory or intellective, of *O*. These species may be thought of as encodings of *O*’s form. If *O* is a particular corporeal object - an iron hoop, for instance - then in *O* itself *O*’s form informs matter to produce an iron hoop of just those dimensions at just that spatio-temporal location. (In Aquinas’ account of individuation, it is matter that is ‘designated’ or ‘determinate’ in this way that individuates *O*’s form: see for example *De ente et essentia* 2.) But when the appropriately encoded form is received in an external sense faculty *F* (which uses a bodily organ), then, even though it is received *materially* in *F*’s matter, it is nonetheless received differently from its reception in the matter of the hoop. The imposition of the form on the matter of the sense organ constitutes an ‘intentional’ or ‘spiritual’ reception of the form, contributing to a cognition of the hoop rather than metaphysically constituting a new, individuated matter-form composite.

Sensory species received in external senses are standardly transmitted to ‘internal senses’, the organs for which, Aquinas thought, must be located in the brain. Among the most important of these for purposes of cognition are ‘phantasia’ and ‘imagination’ (although Aquinas usually treats imagination as part of the power of phantasia). Phantasia and imagination produce and preserve ‘phantasms’, the sensory data that are necessary preconditions for intellective cognition. Imagination and phantasia are also indispensable to conscious sensory cognition. In Aquinas’ view, sensible species themselves are not the objects of cognition, and what he says about phantasia suggests that having sensible species isn’t sufficient for having sensory cognition. *O* itself, currently having a natural effect on the external senses, is consciously sensed because phantasia has processed *O*’s sensible species into phantasms.

The form presented in a phantasm has of course been stripped of its original, individuating matter, but a phantasm of *O* remains particularized as a phantasm in virtue of having been received in the *different* matter of phantasia’s organ, while remaining recognizably the form of *O* because of the details of *O* that are preserved in it. However, cognition of *O* as an iron hoop is conceptual, intellective cognition, for which phantasms are only the raw material.

In intellect itself, Aquinas distinguishes two Aristotelian ‘powers’. The first is *agent intellect*, the essentially active

or productive aspect of intellect, which acts on phantasms in a way that produces 'intelligible species'. These constitute the primary contents of intellect, stored in *possible intellect*, intellect's essentially receptive aspect. 'Through intellect it is natural for us to have cognition of natures. Of course, [as universals] natures do not have existence except in individuating matter. It is natural for us to have cognition of them, however, not as they are in individuating matter but as they are abstracted from it by intellect's consideration', the work of agent intellect, producing intelligible species (*Summa theologiae* Ia.12.4c). The intelligible species of *O* are unlike sensory species of it in that they are only universals, which occur as such only in possible intellect: for example, round, metallic, iron hoop. These 'universal natures' are not only received in the intellective faculty *F*, the possible intellect, but are also of course used regularly as the devices indispensable for intellective cognition of corporeal reality: 'Our intellect both abstracts intelligible species from phantasms, insofar as it considers the natures of things universally, and yet also has intellective cognition of them [the things] in the phantasms, since without attending to phantasms it cannot have intellective cognition of even those things whose [intelligible] species it abstracts' (*Summa theologiae* Ia.85.1, ad 5). It is in this way that 'in intellection we can have cognition of such [particular, corporeal, composite] things in universality, which is beyond the faculty of sense' (*Summa theologiae* Ia.12.4c).

Thus both sense and intellect have cognition of *O*, a particular corporeal thing. However, sense has cognition of *O* only in its particularity (*Sententia super Posteriora analytica* II.20.14). Further, an individual intellect that happened to have the concept 'iron hoop' would have cognition only of a universal nature that happened to be instantiated in *O*, and not also of any instantiation of that nature - unless that intellect were also attending to phantasms of *O*. It is as a result of this attending that intellect also cognizes *O* itself, but as exemplifying a universal, for example, as an iron hoop (*Summa theologiae* Ia.85.5c; *Sententia super De anima* II.12.377).

Although intellect regularly has cognition of a corporeal particular in the way described, its proper object, Aquinas says, is that particular's universal nature, or 'quiddity'. Intellect's 'first operation', then, is its cognition of a universal, its proper object (although as we have seen, agent intellect's abstracting of intelligible species is a necessary step on the way to the cognition of the quiddities of things). Aquinas sometimes calls this first operation 'understanding'. However, *scientia*, which is one of the last operations of intellect, a pinnacle of intellective cognition, also has the natures of things as its objects (see below). Universal natures, the proper objects of intellect's first operation and the objects of the culminating theoretical knowledge of nature, must then be thought of as proper objects of both the beginning and the culmination of intellective cognition. What is cognized in an unanalysed way in the first operation of the intellect - for example, *animal* - is in scientific cognition analysed into the essential parts of its nature - *sensitive animate corporeality* - which are themselves comprehended in terms of all their characters and capacities. In theory, in potentiality, the culminating cognitive state is all that could be hoped for: 'if the human intellect comprehends the substance of any thing - a rock, for example, or a triangle - *none* of the intelligible aspects of that thing exceeds the capacity of human reason' (*Summa contra gentiles* I.3.16).

Intellect's 'second operation' is the making of judgments, affirming by propositionally 'compounding' with one another concepts acquired in the first operation, or denying by 'dividing' them from one another. At every stage past initial acquisition, the cognition of quiddities will partially depend on this second operation, and on reasoning as well: 'the human intellect does not immediately, in its first apprehension, acquire a complete cognition of the thing. Instead, it first apprehends *something* about it - that is, its quiddity, which is a first and proper object of intellect; and *then* it acquires intellective cognition of the properties, accidents, and dispositions associated with the thing's essence. In doing so it has to compound one apprehended aspect with another, or divide one from another, and proceed from one composition or division to another, which is reasoning.' This is sometimes called intellect's third operation (*Summa theologiae* Ia.85.5c).

The framing of propositions and the construction of inferences involving them are necessary preconditions of the culminating intellective cognition Aquinas recognizes as *scientia*, which he discusses in greatest detail in his *Sententia super Posteriora analytica (Commentary on Aristotle's Posterior Analytics)*. The interpretation of his account of *scientia* is controversial, but one helpful way to view it is as follows. To cognize a proposition with *scientia* is, strictly speaking, to accept it as the conclusion of a 'demonstration'. Of course, many premises in demonstrations may themselves be conclusions of other demonstrations; some, however, must be accepted not on the basis of demonstration but *per se* (*Sententia super Posteriora analytica* I.7.5-8). Such propositions, knowable *per se* (although not always *per se* knowable by us) are Aquinas' first principles. Like Aristotle, he calls them immediate propositions; that is, they cannot themselves be the conclusions of demonstrations, and their truth is

evident to anyone who fully understands their terms, who not merely grasps their ordinary meaning but also comprehends the real nature of their referents. The predicate of an immediate proposition belongs to the *ratio* of the proposition's subject, and the *ratio* is the formulation of the subject's real nature (*Sententia super Posteriora analytica* I.10; 33). Thus for example, Aquinas considers 'God exists' to be self-evident, since according to the doctrine of simplicity God's nature is God's existence. 'God exists' is a good example of a proposition knowable *per se* but, as Aquinas insists in rejecting Anselm's ontological argument, not knowable *per se* by us. It is for that reason that he develops a number of *a posteriori* arguments for God's existence, among which the most famous are the 'Five Ways', found in *Summa theologiae* Ia.2.3c (see God, arguments for the existence of).

Anyone who has a developed concept of the subject's real nature is certain of the truth of such an immediate proposition, 'but there are some immediate propositions the terms of which not everyone knows. That is why although the predicate of such a proposition does belong to the ratio of its subject, the proposition need not be granted by everyone, just because its subject's [metaphysical] definition is not known to everyone' (*Sententia super Posteriora analytica* I.5.7). Because proper demonstrations are isomorphic with metaphysical reality, the facts expressed in their premises are regularly to be construed as causes of the facts in their conclusions (*Sententia super Posteriora analytica* I.2.9), although in some cases demonstrative reasoning goes the other way, from effects to causes. So, having *scientia* with respect to some proposition is the fullest possible human cognition, by which one situates the fact expressed by a conclusion in an explanatory theory that accurately maps metaphysical or physical reality.

According to Aquinas, then, what demonstration provides is not so much knowledge as it has been conceived of by foundationalists (for example, Descartes) as it is depth of understanding and explanatory insight. In general, Aquinas does not begin with self-evident principles and derive conclusions from them deductively; 'rather [he begins] with a statement to be justified (it will become the "conclusion" only in a formal restatement of the argument) and "reduce[s]" it back to its ultimate explanatory principles' (Durbin 1968: 82). When Aquinas himself describes his project generally, he says that there are two different processes in which human reason engages: *discovery* (or invention) and *judgment*. When we engage in discovery, we proceed from first principles, reasoning from them to other things; in judgment we reason to first principles on the basis of a kind of analysis. In his view, it is judgment's reasoning process, not that of discovery, that leads to *scientia*, and judgment is the subject of the *Posterior Analytics*: 'Judgment goes with the certitude of *scientia*. And it is because we cannot have certain judgment about effects except by analysis leading to first principles that this part of human reasoning is called "analytics"' (*Sententia super Posteriora analytica*, prooemium).

Sceptical worries seldom intrude on Aquinas' scattered development of his systematically unified theory of knowledge, largely because it is based on a metaphysics in which the first principle of existence is an omniscient, omnipotent, perfectly good God, whose rational creatures could not have been made so as to be standardly mistaken about the rest of creation (see God, concepts of; Knowledge, concept of).

12 Will and action

Philosophy of mind is obviously relevant to epistemology in its account of the mechanisms of cognition, especially of intellect. In its account of will it is just as obviously relevant to action theory and to ethics. Aquinas' concern with moral issues is even greater than his considerable interest in epistemological issues, and his ethics is so fully developed that he integrates his systematic treatment of acts of will into it rather than including such a treatment in his philosophy of mind.

As intellect is the cognitive faculty of the distinctively human rational soul, so will is its appetitive faculty. Will's metaphysical provenance is more primitive than intellect's; it is merely the most subtle terrestrial instantiation of an utterly universal aspect of creation. Not only every sort of soul but absolutely every form, Aquinas maintains, has some sort of inclination essentially associated with it; and so every hylomorphic thing, even if inanimate, has at least one natural inclination: 'on the basis of its form, fire, for instance, is inclined toward a higher place, and toward generating its like' (*Summa theologiae* Ia.80.1c). Inclination is the genus of appetite, and appetite is the genus of will. The human soul of course involves *natural appetites* - for example, for food - but its sensory and intellective modes of cognition bring with them *sensory appetites*, or passions - for example, for seafood - and *rational appetite*, or volition - for example, for food low in fat content.

In human beings, sensory appetite, or ‘sensuality’, is a cluster of inclinations (passions) to which we are subject (passive) by animal nature. Following an Aristotelian line, Aquinas thinks of sensuality as sorted into two complementary powers: the *concupiscible* - pursuit/avoidance instincts - and the *irascible* - competition/aggression/defense instincts. With the former are associated the emotions of joy and sadness, love and hate, desire and repugnance; with the latter, daring and fear, hope and despair, anger.

For philosophy of mind and for ethics, one important issue is the manner and extent of the rational faculties’ control of sensuality, a control without which the harmony of the human soul is threatened and morality is impossible - especially in Aquinas’ reason-centered ethics with its focus on virtues and vices. A human being who is not aberrantly behaving like a non-rational animal ‘is not immediately moved in accordance with the irascible and concupiscible appetite but waits for the command of will, which is the higher appetite’ (*Summa theologiae* Ia.81.3c). But the kind of control exercised by a cognitive rational faculty (standardly identified in this role as ‘practical reason’ rather than the broader ‘intellect’) is less obvious, and is particularly interesting in view of Aquinas’ account of intellective cognition. The rational faculties can direct the attention of the external senses and compensate to some extent for their malfunctioning, but they cannot directly control what the external senses initially perceive on any occasion. On the other hand, sensuality and the internal senses are not directly related to mind-independent external things, and so to some extent ‘they are subject to reason’s command’, although they too can fight against reason (*Summa theologiae* Ia.81.3, ad 3). Elaborating an Aristotelian theme (*Politics* I, 2), Aquinas observes that the soul’s rule over the body is ‘despotic’: in a normal body, any bodily part that can be moved by an act of will will be moved immediately when and as will commands. But the rational faculties rule sensuality ‘politically’, because the powers and passions that are the intended subjects of this rational governance are also moved by imagination and sense, and so are no slaves to reason. ‘That is why we experience the irascible or the concupiscible fighting against reason when we sense or imagine something pleasant that reason forbids, or something unpleasant that reason commands’ (*Summa theologiae* Ia.81.3, ad 2).

According to Aquinas, the volition for happiness in general is an ineluctable part of human nature (see §13 below). Nonetheless, ‘the movement of a creature’s will is not determined in particular to seeking happiness in this, or in that’ (*Quaestiones disputatae de veritate* 24.7, ad 6). This sort of freedom of will is freedom of specification or ‘freedom as regards the object’, freedom in the ‘determining’ aspect of volition. It is distinguished from freedom of exercise or ‘freedom as regards the act’, freedom associated with will’s ‘executive’ capacity, for either acting or not acting to achieve something apprehended as good.

The interpretation of Aquinas’ account of freedom of will is controversial. The very phrase ‘freedom of will’ is part of the difficulty, because it imports a concept from a later tradition. Aquinas conceives of freedom as *liberum arbitrium* (free decision or judgment), which cannot be attributed to will alone. It is a property that inheres in the system of intellect and will as a whole, that emerges from their interaction. However, it is perhaps safe to say that, since Aquinas emphatically denies that any volition caused by something extrinsic to the agent can be free, his account of freedom of will is not a version of compatibilism (see for example *Summa theologiae* IaIIae.6.4). The one apparent exception has to do with God’s acting on a human will. Aquinas holds that among extrinsic forces, God alone can act directly on some other person’s will without violating the will’s nature, that is, without undermining its freedom (see for example *Summa theologiae* IaIIae.9.6). On this basis, some interpreters characterize Aquinas as a theological compatibilist; however, the subtle complexities of his account of God’s action on human wills leads others to claim that a full appreciation of those complexities would show that Aquinas is not in any sense a compatibilist (see Determinism and indeterminism; Free will).

Aquinas’ analysis of human action, built on his account of will and intellect, is complicated and not readily summarized. Generally speaking, he finds elaborately ordered mental components in even simple acts. For instance, in a case of raising one’s hand to attract attention we are likely to suppose that the mental antecedents of the bodily movement are just the agent’s combined beliefs and desires, whether or not the agent is fully conscious of them. Aquinas would of course agree that the agent need not be completely aware of the overt action’s mental antecedents, but he sees them as having a complex, hierarchical structure.

On his analysis, the action begins when (I1) the agent’s intellect apprehends a certain end - attracting attention - as a good to be achieved in these particular circumstances. (I1) thus gives rise to a second component: (W1) the agent’s will forms a simple volition for that end. Then, (I2) the agent’s intellect considers whether the end can be

achieved at that time. If the result of (I2) is affirmative, then on that basis (W2) the agent's will forms an intention to achieve the end by some means or other. Next, (I3) the agent's intellect surveys the available means and settles on one or more that would be suitable to achieve the end and acceptable to the agent, and (W3) the agent's will accepts the means. If intellect has found more than one suitable and acceptable means, then (I4) intellect compares them and determines which is best in the circumstances, and (W4) will opts for that means. The process comes to its natural end when (W5) the agent's will exercises its control over the agent's arm, and the arm goes up. This ordered series looks deterministic, but as Aquinas views the interaction between intellect and will, the process could go otherwise at almost any point because will could direct intellect to reconsider, to direct attention in some other way, or even just to stop thinking about the issue (*Summa theologiae* IaIIae.6-17).

13 Ethics, law and politics

Aquinas' moral theory is developed most extensively and systematically in the Second Part of *Summa theologiae*. (Broadly speaking, the general theory is in IaIIae and the detailed consideration of particular issues is in IIaIIae.) Like almost all his predecessors, medieval and ancient, Aquinas sees ethics as having two principal topics: first, the ultimate goal of human existence, and second, how that goal is to be won, or lost. Of the 303 Questions making up *Summa theologiae*'s Second Part, 298 are concerned in one way or another with the second topic, and only the first 5 are concerned directly with the first (although in *Summa contra gentiles* III he devotes chapters 25-40 to a detailed examination of it).

Summa theologiae IaIIae.1-5, sometimes called the Treatise on Happiness, develops an argument to establish the existence and nature of a single ultimate end for all human action, or, more strictly, the kind of behaviour over which a person has 'control'. First, 'all actions that proceed from a power are caused by that power in accordance with the nature of its object. But the object of will is an end and a good', that is, an end perceived as good by the willer's intellect (*Summa theologiae* IaIIae.1.1c). From this starting point Aquinas develops an argument designed to show that a human being necessarily (though not always consciously) seeks everything it seeks for its own ultimate end, happiness.

Aquinas argues that the often unrecognized genuine ultimate end for which human beings exist (their 'object') is God, perfect goodness personified; and perfect happiness, the ultimate end with which they may exist (their 'use' of that object), is the enjoyment of the end for which they exist. That enjoyment is fully achieved only in the beatific vision, which Aquinas conceives of as an activity. Since the beatific vision involves the contemplation of the ultimate (first) cause of everything, it is, whatever else it may be, also the perfection of all knowledge and understanding (*Summa theologiae* IaIIae.1.8; 3.8).

Aquinas devotes just four questions of *Summa theologiae* IaIIae (18-21) to 'the goodness and badness of human acts in general'. Although considerations of rightness and wrongness occupy only a little more than ten per cent of the discussion in Questions 18-21, Aquinas nonetheless appears to think of rightness and wrongness as the practical, distinctively moral evaluations of actions. His emphasis on the broader notions of goodness and badness reveals the root of his moral evaluation of actions in his metaphysical identification of being and goodness (see §9 above).

What makes an action morally bad is its moving the agent not toward, but away from, the agent's ultimate goal. Such a deviation is patently irrational, and Aquinas' analysis of the moral badness of human action identifies it as fundamentally irrationality, since irrationality is an obstacle to the actualization of a human being's specifying potentialities, those that make *rational* the differentia of the human species. In this as in every other respect, Aquinas' ethics is reason-centred:

> In connection with human acts the words 'good' and 'bad' are applied on the basis of a comparison to reason, because… a human being's good is existing in accordance with reason, while what is bad for a human being is whatever is contrary to reason. For what is good for any thing is what goes together with it in keeping with its form, and what is bad for it is whatever is contrary to the order associated with its form.
>
> (*Summa theologiae* IaIIae.18.5c)

It would be a mistake, however, to suppose that Aquinas takes moral evil to consist in intellective error. Because of the very close relationship he sees between intellect and will, the irrationality of moral wrongdoing will be a

function of will as well, not just of intellect. In Aquinas' view, the moral evaluation of a human action attaches primarily to the 'internal act', the volition from which the external act derives. Since 'will is inclined toward reason's good [the good presented to will by intellect] by the very nature of the power of will', bad volition stems from defective deliberation (*Summa theologiae* IaIIae.50.5, ad 3). As intellect and will continually influence each other, so bad deliberation can also be an effect of bad volition. Moreover, practical intellect's mistakes in identifying the best available course of action may also have the passions of the sensory soul as sources.

Furthermore, 'because the good [presented by intellect] is varied in many ways, it is necessary that will be inclined through some habit toward some determinate good presented by reason so that [will's determining] activity may follow more promptly' (*Summa theologiae* IaIIae.50.5, ad 3). Habits of will are conditions necessary for our carrying out our volitions in particularly good or particularly bad ways, as regards both the 'executive' and the 'determining' aspects of volition; and the habits that play these crucial roles in Aquinas' moral theory are the virtues and the vices.

The four 'cardinal virtues' can be understood as habits of this sort. Reason's habit of good governance generally is *prudence*; reason's restraint of self-serving concupiscence is *temperance*; reason's persevering despite self-serving 'irascible' passions such as fear is *courage*; reason's governance of one's relations with others despite one's tendencies toward selfishness is *justice*. Aquinas' normative ethics is based not on rules but on virtues; it is concerned with dispositions first and only then with actions. In addition to the moral virtues in all their various manifestations, Aquinas also recognizes intellectual virtues that, like the moral virtues, can be acquired by human effort. On the other hand, the supreme theological virtues of faith, hope and charity cannot be acquired but must be directly 'infused' by God. Aquinas introduces these virtues and others in *Summa theologiae* IaIIae 49-88 and examines them in detail throughout IIaIIae (see Virtue ethics).

Passions, virtues and vices are all intrinsic principles, or sources, of human acts. However, there are extrinsic principles as well, among which is law in all its varieties. Consequently, Aquinas moves on in *Summa theologiae* IaIIae.90-108 to his Treatise on Law, a famous and original treatment of the subject. The best-known feature of the treatise is Aquinas' concept of natural law. Law in general is 'a kind of rational ordering for the common good, promulgated by the one who takes care of the community' (*Summa theologiae* IaIIae.90.4c), and 'the precepts of natural law are to practical reasoning what the first principles of demonstrations are to theoretical reasoning…. All things to be done or to be avoided pertain to the precepts of natural law, which practical reasoning apprehends naturally as being human goods' (IaIIae.94.2c). Human laws of all kinds derive, or should derive, from natural law, which might be construed as the naturally knowable rational principles underlying morality in general: ' From the precepts of natural law, as from general, indemonstrable principles, it is necessary that human reason proceed to making more particular arrangements… [which] are called human laws, *provided that* they pertain to the definition (*rationem*) of law already stated' (IaIIae.91.3c). As a consequence of this hierarchy of laws, Aquinas unhesitatingly rejects some kinds and some particular instances of human law, for example: 'A tyrannical law, since it is not in accord with reason, is not unconditionally a law but is, rather, a perversion of law' (IaIIae.92.1, ad 4). Even natural law rests on the more fundamental 'eternal law', which Aquinas identifies as divine providence, 'the very nature of the governance of things on the part of God as ruler of the universe' (IaIIae.91.1c) (see Natural law).

In *De regimine principum (The Governance of Rulers)*, his most important political work, Aquinas begins by sounding the familiar medieval theme: monarchy is the best form of government. However, he realizes that a single ruler is easily corrupted and that monarchy therefore has a tendency to turn into tyranny. He seems not to countenance revolution against a legitimate ruler who has become tyrannical (*De regimine principium* 6), but he maintains that radical means, including tyrannicide, may be justified against a usurper. Perhaps because he came to appreciate the dangers in monarchy, he gradually works republican elements into his theory of good government. His later commentary on Aristotle's *Politics* seems to erode the dominant monarchical model further in its treatment of the notions of the commonwealth (*res publica*) and of the citizen as one who rules and is ruled in turn (see Political philosophy, history of).

14 Theology: natural, revealed and philosophical

Because Aquinas developed most of his thought within the formal confines of thirteenth-century theology, and because this has in turn affected his place in the history of philosophy and the assessment of his work, some

attention must be paid to the ways in which much of what we recognize as philosophy was an essential component of what he thought of as theology.

Aquinas devotes the first three books of *Summa contra gentiles* to a systematic development of natural theology, which he saw as part of philosophy (*Summa theologiae* Ia.1.1, ad 2) (see Natural theology). As part of philosophy, natural theology must of course be based entirely on 'principles known by the natural light of intellect' (*Summa theologiae* Ia.1.2c), principles of the sort that underlie Aristotle's metaphysics, which Aristotle himself thought of as culminating in 'theology' (see Aquinas' interpretation of that thought in the prooemium to his *Sententia super Metaphysicam (Commentary on Aristotle's Metaphysics)*. In fact, the way Aquinas works in *Summa contra gentiles* I-III strongly suggests that he may have thought of natural theology as a science subordinate to metaphysics, somewhat as he would have understood optics to be subordinate to geometry.

However, there is something odd about that project of his. By Aquinas' day the churchmen governing universities had overcome most of their initial misgivings about the recently recovered works of the pagan Aristotle, and had acknowledged officially that the study of Aristotelian physics and metaphysics (with their integrated minor component of natural theology) was compatible with the then universally recognized availability of revealed truths about God. Medieval Christians had come to appreciate the ancient philosophers' attempts to uncover truths about God on the basis of observation and reasoning alone as having been justified, even commendable, given their total ignorance of revelation. However, no philosopher in Aquinas' circumstances could have justifiably undertaken a new project of natural theology heuristically.

Still, no opprobrium would attach to natural theology taken up expositionally. The aim of such an enterprise would be not to develop theology from scratch but rather to show, in the spirit of Romans 1: 20, the extent to which what had been supernaturally revealed could, in theory, have been naturally discovered. Such an enterprise is what *Summa contra gentiles* I-III seems to represent.

Evidence from a chronicle written about seventy years after Aquinas began *Summa contra gentiles* once led scholars to suppose that he had written it as a manual for the use of Dominican missionaries to Muslims and Jews. If that were so, then the work's presentation of natural instead of revealed theology in its first three books would have been dictated by the practical purpose of rationally deriving the truth about God, and about God's relation to everything else, for people who would not have acknowledged the revealed texts Aquinas would otherwise have cited as the source of that truth. But nobody, and certainly not Aquinas, could have supposed that Muslims or Jews needed to be argued into perfect-being monotheism of the sort developed in those first three books, which contain nothing that he would have taken to be contrary to Judaism or Islam. If Aquinas had intended *Summa contra gentiles* as a manual for missionaries to educated Muslims, Jews or Christian heretics, he would have wasted the enormous effort represented in the 366 copiously argued chapters of Books I-III (see Gauthier 1961, 1993, for a persuasive rejection of the earlier account).

What Aquinas himself says about his purpose in writing *Summa contra gentiles* suggests that what he wrote had at least its formal cause not in an attempt to aid missionary activities, but instead in his consideration of the interrelation of philosophy and Christianity. He begins by writing about the concerns of a wise person, one of those 'who give things an appropriate order and direction and govern them well' (*Summa contra gentiles* I.1.2). Obviously, such a person has to be concerned with goals and sources, and so the wisest person will be 'one whose attention is turned toward the universal goal, which is also the universal source', which Aquinas takes to be God (I.1.3). Because this natural theology is oriented as it is, 'it must be called the greatest wisdom itself, as considering the absolutely highest cause of all' (II.4.874). Therefore, the highest, most universal explanatory truth must be wisdom's concern. Anyone aspiring to wisdom will attend to metaphysics, since, Aquinas reports, Aristotle rightly identified metaphysics as 'the science of truth - not of just any truth, but of the truth that is the origin of all truth, the truth that pertains to the first principle of being for all things' (I.1.5). And, as he says in an observation that suits his own enterprise, 'sometimes divine wisdom proceeds from human philosophy's starting points' (II.4.875). However, since it is the business of one and the same science 'to pursue one of two contraries and to repel the other… the role of the wise person is to meditate on the truth, especially the truth regarding the first principle, and to discuss it with others, but also to fight against the falsity that is its contrary' (I.1.6). The truth regarding the first principle will be the truth about God, supposing natural theology can show that God exists; and so the explanatory truth associated here with metaphysics is the truth associated also with theology.

No one knows what title, if any, Aquinas himself gave to this work. In some of its medieval manuscripts, it is entitled *Liber de veritate catholicae fidei contra errores (A Book About the Truth of the Catholic Faith, Directed Against Mistakes)*, a title that comes closer to accurately representing the book's aim and contents than the more pugnacious, traditional *Summa contra gentiles (Synopsis [of Christian Doctrine] Directed Against Unbelievers)*. During the nineteenth century, when *Summa theologiae (Synopsis of Theology)* was instead normally referred to as *Summa theologica (Theological Synopsis)*, *Summa contra gentiles* was sometimes published under the deliberately contrasting title *Summa philosophica (Philosophical Synopsis)*. That contrast, although potentially misleading, has some truth in it, as may be seen in Aquinas' plan for *Summa contra gentiles* I-III: 'Since we intend to pursue by way of reason the things about God that human reason can investigate, the first consideration is of matters associated with God considered in himself [Book I]; second, of the emergence of created things from him [Book II]; third, of the ordering and directing of created things toward him as their goal [Book III]' (I.9.57).

In this pursuit by way of reason, Aquinas must and does shun 'authoritative arguments' of any sort, but he shows good sense in not restricting himself to 'demonstrative arguments' in developing natural theology. He does, of course, use demonstrative arguments when he thinks he has them, but, like almost all philosophers of any period, he recognizes philosophy's need for 'probable aguments' as well. A demonstrative argument takes as its premises propositions that explain the fact in the argument's conclusion by elucidating its causes (or, sometimes, its effects), and so it produces, or presents, scientific understanding. A probable argument - the sort that has always been most prevalent and most appropriate in philosophy - is one based on premises of any sort that are accepted widely or by experts in the relevant field, and so one group may be convinced by a probable argument that another group rejects. Of course, Aquinas has to make use of authoritative arguments in the fourth (and last) book, where he turns from natural to revealed theology, and his tolerance of them there is part of what distinguishes Book IV's argumentation from the sort that characterizes Books I-III.

In *Summa contra gentiles* IV, Aquinas engages in what has come to be called *philosophical theology*, the application of reason to revelation. Philosophical theology shares the methods of natural theology broadly conceived - in other words, analysis and argumentation of all the sorts accepted in philosophy - but it lifts natural theology's restriction on premises, accepting as assumptions revealed propositions. This includes those that are initially inaccessible to unaided reason, such as the 'mysteries' of Christian doctrine. In his many works of philosophical theology, Aquinas tests the coherence of doctrinal propositions (including the mysteries), attempts explanations of them, uncovers their logical connections with other doctrinal propositions and so on, in order to bear out his conviction that the doctrines themselves are eminently understandable and acceptable, and that the apparent incoherence of some of them is only a feature of our initial, superficial view of them.

Summa theologiae is the paradigm of philosophical theology. The very first Article of the very first Question makes it clear at once that it is not natural theology that *Summa theologiae* is a summa of, since it begins by asking whether we need any 'other teaching, besides philosophical studies'; which in Aquinas' usage means the studies that medieval beginners in theology would have just completed in the arts faculty. The question arises because philosophical studies are characterized not only as dealing with 'the things that are subject to reason', but also as encompassing 'all beings, including God', as a consequence of which 'part of philosophy is called theology'.

Although Aquinas accepts this characterization of philosophy's subject matter as universal and as including a part that is properly called theology, he offers several arguments to support his claim that revealed theology is nonetheless not superfluous. In one of those arguments, he claims that a thing's 'capacity for being cognized in various ways brings about a difference between sciences'. By this he means that different sciences can reason to some of the same conclusions on the basis of different premises or evidence. In his example, he points out that in order to support the proposition that the earth is round a naturalist uses empirical observations, while a cosmologist might support that same conclusion on a strictly formal basis. 'And for that reason', he concludes, 'nothing prevents the same things from being treated by philosophical studies insofar as they can be cognized by the light of natural reason, and also by another science insofar as they are cognized by the light of divine revelation. That is why the theology that pertains to *sacra doctrina* [in other words, revealed theology] differs in kind from the theology that is considered a part of philosophy' (ad 2).

In this argument, Aquinas might appear willing to concede that revealed and natural theology differ only in this methodological respect, that they simply constitute two radically different ways of approaching the very same

propositions about God and everything else. However, he would not actually concede this. There are propositions that belong uniquely to revealed theology's subject matter, simply because the different premises with which revealed theology begins can also lead to conclusions not available to unaided reason. And, of course, no doctrinal proposition that is initially available to human beings only in virtue of having been revealed by God can be part of natural theology's subject matter.

On the other hand, no propositions appropriate to natural theology are excluded from *Summa theologiae*'s subject matter. The propositions that belong to natural theology form a proper subset of those that belong to revealed theology:

> It was necessary that human beings be instructed by divine revelation even as regards the things about God that human reason can explore. For the truth about God investigated by a few on the basis of reason [without relying on revelation] would emerge for people [only] after a long time and tainted with many mistakes. And yet all human well-being, which has to do with God, depends on the cognition of that truth. Therefore, it was necessary for human beings to be instructed about divine matters through divine revelation so that [the nature of human] well-being might emerge for people more conveniently and with greater certainty.
>
> (*Summa theologiae* Ia.1.1c)

When he sums up his examination of *sacra doctrina*, or revealed theology, Aquinas says that its 'main aim… is to transmit a cognition of God, and not only as he is in himself, but also as he is the source of things, and their goal - especially of the rational creature' (*Summa theologiae* Ia.2, intro.). Thus the subject matter of *sacra doctrina*, the theology presented in this summa of theology, is the most basic truths about *everything*, with two provisos: first, it is about God and about things other than God as they relate to God as their source and goal; second, among things other than God it deals with, it is especially about human beings, whose study of theology should be motivated by the fact that their well-being depends specially on their grasp of certain theological truths. And, Aquinas insists, universal scope is just what one should expect in a rational investigation of the truth about God: 'All things are considered in *sacra doctrina* under the concept of God, either because they *are* God, or because they have an ordered relationship *to* God as to their source and goal. It follows from this that the subject of this science is really God', even though the intended explanatory scope of the science is universal (*Summa theologiae* Ia.1.7c).

In referring to *sacra doctrina* as a 'science', Aquinas means to characterize it as a systematic, reasoned presentation of an organized body of knowledge consisting of general truths about some reasonably unified subject matter. In that broadly Aristotelian sense, it is not obviously wrong to think of theology as a science (as it would be in the narrower, twentieth-century sense of 'science'). It is in that sense that the science of theology as Aquinas develops it in *Summa theologiae* would now be called philosophical theology, the enterprise of employing the techniques and devices of philosophy in clarifying, supporting and extending the propositions that are supposed to have been revealed for theology's starting points. Thus, some of the work of philosophical theology is an attempt to explain revealed propositions and systematically work out their implications.

Like natural theology, which is subordinate to metaphysics, philosophical theology is a subordinate science. However, because it begins its work on divinely revealed propositions, Aquinas identifies the 'science' to which it is subordinate as God's knowledge of himself and everything else, available to human beings directly only in the afterlife (*Summa theologiae* Ia.1.2c). As he says earlier, 'For us, the goal of faith is to arrive at an understanding of what we believe - [which is] as if a practitioner of a subordinate science were to acquire in addition the knowledge possessed by a practitioner of the higher science. In that case the things that were only believed before would come to be known, or understood' (*Expositio super librum Boethii De trinitate* 2.2, ad.7).

Not even the doctrinal mysteries are impervious to rational investigation, although unaided reason could never have discovered them. Regarding one central mystery, for example, Aquinas says: 'It is impossible to arrive at a cognition of the Trinity of the divine persons by means of natural reason' (*Summa theologiae* Ia.32.1c). However, he says this in the twenty-second of a series of seventy-seven articles of *Summa theologiae* devoted to analysing and arguing about the details of Trinity, in other words, in the midst of subjecting this mystery to philosophical theology. As he explains in the very Article in which he rules out the possibility of rationally discovering that there are three divine persons:

> There are two ways in which reason is employed regarding any matter… in one way to provide sufficient proof

of something fundamental… in the other way to show that consequent effects are suited to something fundamental that has already been posited…. It is in the first way, then, that reason can be employed to prove that God is one, and things of that sort. But it is in the second way that reason is employed in a clarification of Trinity. For once Trinity has been posited, reasonings of that sort are suitable, although not so as to provide a sufficient proof of the Trinity of persons by those reasonings.

(*Summa theologiae* Ia.32.1c)

Aquinas is also careful to point out that it isn't mere intellectual curiosity or even a defense of the faith that is served by a rational clarification of Trinity. In his view, this application of philosophical theology - confirming faith by reason, showing that Trinity is not after all irrational, exposing the intricate connections between these and other doctrinal propositions - aids one's understanding of creation and salvation (see Trinity).

List of works

Not all of Aquinas' works exist in critical editions, but the many volumes of the Leonine Edition ordinarily provide the best available Latin texts. Most volumes of the Marietti Editions reproduce the Leonine text in handier form with useful aids to research. There are many translations into English and other modern languages, but by no means all the works have been translated. For detailed lists of editions and translations of each work see Torrell (1993), Weisheipl (1983) or Gilson (1956). Ingardia (1993) is an indispensable bibliography. Deferrari and Barry (1948) is an indispensable lexicon. Busa (1974-80) provides an exhaustive but somewhat unwieldy resource for research in Aquinas. The following is an approximately chronological list of works, excluding letters and liturgies. Places of composition are given after each work.

Aquinas, Thomas (1248-73) *Opera omnia (Complete Works)*, ed. Leonine Commission, *S. Thomae Aquinatis Doctoris Angelici. Opera Omnia. Iussu Leonis XIII, P.M. edita*, Rome: Vatican Polyglot Press, 1882-.(Many of the editions in this series are repeated in the Marietti Editions.)

Aquinas, Thomas (1248-52, or 1252-6) *De principiis naturae, ad fratrem Sylvestrum (On the Principles of Nature, for Brother Sylvester)*.(Written either at Cologne, 1248-52, or Paris, 1252-6).

Aquinas, Thomas (1251/2) *Expositio super Isaiam ad litteram (Literal Commentary on Isaiah)*.(Written at Cologne.)

Aquinas, Thomas (1251/2) *Postilla super Ieremiam (Commentary on Jeremiah)*.(Written at Cologne.)

Aquinas, Thomas (1251/2) *Postilla super Threnos (Commentary on Lamentations)*.(Written at Cologne.)

Aquinas, Thomas (1252/3? or 1273?) *Postilla super Psalmos (Commentary on Psalms)*. (Written either at Paris, 1252/3, or Naples, 1273. Incomplete, covers Psalms 1-54.)

Aquinas, Thomas (1252-6) *De ente et essentia, ad fratres et socios suos (On Being and Essence, For His Brothers and Companions)*.(Written at Paris.)

Aquinas, Thomas (1253-6) *Scriptum super libros Sententiarum (Commentary on the Sentences)*.(Written at Paris.)

Aquinas, Thomas (1256) *Principia: 'Hic est liber mandatorum Dei' et 'Rigans montes de superioribus suis' (Inaugural Lectures: 'This Is the Book of God's Commandments' and 'Watering the Hills from His Places Above')*.(Written at Paris.)

Aquinas, Thomas (1256) *Contra impugnantes Dei cultum et religionem (Against Those Who Assail the Worship of God and Religion)*.(Written at Paris, a refutation of William of Saint-Amour's *De periculis novissimorum temporum*.)

Aquinas, Thomas (1256-9) *Quaestiones disputatae de veritate (Disputed Questions on Truth)*.(Written at Paris.)

Aquinas, Thomas (1256-9) *Quaestiones quodlibetales VII-XI (Quodlibetal Questions VII-XII)*.(Written at Paris.)

Aquinas, Thomas (1257/8) *Expositio super librum Boethii De trinitate (Commentary on Boethius' De trinitate)*. (Written at Paris; incomplete.)

Aquinas, Thomas (1259?) *Expositio super librum Boethii De hebdomadibus (Commentary on Boethius' De hebdomadibus)*.(Written at Paris; incomplete.)

Aquinas, Thomas (1259-65) *Summa contra gentiles (Synopsis [of Christian Doctrine] Directed Against Unbelievers)*.(Written at Paris, Naples and Orvieto.)
Aquinas, Thomas (1261-5) *Expositio super Iob ad litteram (Literal Commentary on Job)*.(Written at Orvieto.)
Aquinas, Thomas (1261-5, or 1265-8) *Expositio super librum Dionysii De divinis nominibus (Commentary on Dionysius' De divinis nominibus)*.(Written at Orvieto, 1261-5, or Rome, 1265-8.)
Aquinas, Thomas (1262-8) *Glossa continua super Evangelia (Catena aurea) (A Continuous Gloss on the Four Gospels (The Golden Chain))*.(Written at Orvieto and Rome.)
Aquinas, Thomas (1263/4) *Contra errores Graecorum, ad Urbanem IV Pontificem Maximum (Against Mistakes of the Greek [Fathers of the Church], for Pope Urban IV)*.(Written at Orvieto, on an anonymous treatise, *De fide sanctae trinitatis contra errores Graecorum*.)
Aquinas, Thomas (1264) *De rationibus fidei contra Saracenos, Graecos, et Armenos, ad cantorem Antiochiae (On Arguments for the Faith Directed against Mohammedans, Greek Orthodox Christians and Armenians, for the Cantor of Antioch)*.
Aquinas, Thomas (1265-6) *Quaestiones disputatae de potentia (Disputed Questions on Power)*.(Written at Rome.)
Aquinas, Thomas (1265-6) *Quaestio disputata de anima (Disputed Question on the Soul)*. (Twenty-one articles, written at Rome.)
Aquinas, Thomas (1265-7) *Responsio ad fr. Ioannem Vercellensem de articulis 108 sumptis ex opere Petri de Tarentasia (Reply to Brother John of Vercelli Regarding 108 Articles Drawn from the Work of Peter of Tarentaise [on the Sentences])*.(Written at Rome.)
Aquinas, Thomas (1265-7) *Compendium theologiae, ad fratrem Reginaldum socium suum (A Compendium of Theology, for Brother Reginald, his Companion)*. (Written at Rome, incomplete.)
Aquinas, Thomas (1266-72) *Quaestiones disputatae de malo (Disputed Questions on Evil)*.(Written at Rome and Paris.)
Aquinas, Thomas (1266-68) *Summa theologiae Ia (Synopsis of Theology, First Part)*.(Written at Rome. See below for IaIIae, IIaIIae and IIIa. The whole of the *Summa theologiae* can be found in the Leonine edition, vols 4-12.)
Aquinas, Thomas (1267) *De regno [or De regimine principum], ad regem Cypri (On Kingship [or On the Governance of Rulers], for the King of Cyprus)*. (Written at Rome. Authentic only through Book II, c. 4.)
Aquinas, Thomas (1267-8) *Sententia super De anima (Commentary on Aristotle's On the Soul)*.(Written at Rome.)
Aquinas, Thomas (1267-8) *Quaestio disputata de spiritualibus creaturis (Disputed Question on Spiritual Creatures [Angels])*.(Eleven articles, written at Rome.)
Aquinas, Thomas (1268-9) *Sententia super Physicam (Commentary on Aristotle's Physics)*.(Written at Paris.)
Aquinas, Thomas (1268-9) *Sententia super Meteora (Commentary on Aristotle's Meteora)*. (Written at Paris, incomplete.)
Aquinas, Thomas (1268-70) *Sententia super De sensu et sensato (Commentary on Aristotle's De sensu et sensato)*.(Written at Paris.)
Aquinas, Thomas (1268-71) *Summa theologiae IaIIae (Synopsis of Theology, First Part of the Second Part)*. (Written at Rome and Paris.)
Aquinas, Thomas (1268-72) *Quaestiones quodlibetales I-VI, XII (Quodlibetal Questions I-VI, XII)*.(Written at Paris.)
Aquinas, Thomas (1269) *De forma absolutionis sacramentalis, ad generalem magistrum Ordinis (On the Form of Sacramental Absolution, for the Master General of the Order [John Vercelli])*.(Written at Paris.)
Aquinas, Thomas (1269) *De secreto (On Secret Testimony)*.(Written at Paris. A committee report in which Aquinas is the lone dissenter, supporting the right of a religious superior to compel a subject to reveal a secret even under the seal of confession.)
Aquinas, Thomas (1269-70) *Lectura super Matthaeum (Lectures on the Gospel of Matthew)*.(Written at Paris.)
Aquinas, Thomas (1269-70) *De perfectione spiritualis vitae (On the Perfecting of the Spiritual Life)*.(Written at Paris, directed against Gérard d'Abbeville's *Contra adversarium perfectionis christianae*.)
Aquinas, Thomas (1269-72) *Sententia libri Politicorum (Commentary on Aristotle's Politics)*. (Written probably at Paris; incomplete.)
Aquinas, Thomas (1270?) *Sententia super De memoria et reminiscentia (Commentary on Aristotle's De memoria et reminiscentia)*.(Written probably at Paris.)
Aquinas, Thomas (1270) *Tabula libri Ethicorum (An Analytical Table of Aristotle's Ethics)*. (Written at Paris, incomplete.)

Aquinas, Thomas (1270) *De unitate intellectus, contra Averroistas (On the Unicity of Intellect, Against the Averroists)*.(Written at Paris.)
Aquinas, Thomas (1270-1) *Sententia super Peri hermenias (Commentary on Aristotle's De interpretatione)*.(Written at Paris, incomplete.)
Aquinas, Thomas (1270-2) *Lectura super Ioannem (Lectures on the Gospel of John)*.(Written at Paris.)
Aquinas, Thomas (1270-3) *Sententia super Metaphysicam (Commentary on Aristotle's Metaphysics)*.(Written at Paris and Naples.)
Aquinas, Thomas (1270-3) *Expositio et lectura super Epistolas Pauli Apostoli (Commentary and Lectures on the Epistles of Paul the Apostle)*.(Written at Paris and Naples.)
Aquinas, Thomas (1271) *De aeternitate mundi, contra murmurantes (On the Eternity of the World, Against Grumblers)*.(Written at Paris.)
Aquinas, Thomas (1271) *Responsio ad magistrum Ioannem de Vercellis de articulis 42 (Reply to Master John Vercelli Regarding Forty-Two Articles)*.(Written at Paris. Aquinas' answers to doctrinal questions which Vercelli submitted also to Albert the Great and Robert Kilwardby.)
Aquinas, Thomas (1271-2) *Summa theologiae IIaIIae (Synopsis of Theology, Second Part of the Second Part)*.(Written at Paris.)
Aquinas, Thomas (1271-2) *Contra doctrinam retrahentium a religione (Against the Teaching of Those Who Dissuade [Boys] from Entering the Religious Life)*.(Written at Paris, opposing the work of Gérard d'Abbeville.)
Aquinas, Thomas (1271-2) *Sententia libri Ethicorum (Commentary on Aristotle's Nicomachean Ethics)*.(Written at Paris.)
Aquinas, Thomas (1271-2) *Sententia super Posteriora analytica (Commentary on Aristotle's Posterior Analytics)*.(Written at Paris.)
Aquinas, Thomas (1271-2) *Quaestio disputata de virtutibus in communi (Disputed Question on the Virtues in General)*.(Thirteen articles, written at Paris.)
Aquinas, Thomas (1271-2) *Quaestio disputata de caritate (Disputed Question on Charity)*. (Thirteen articles, written at Paris.)
Aquinas, Thomas (1271-2) *Quaestio disputata de correctione fraterna (Disputed Question on Fraternal Correction)*.(Two articles, written at Paris.)
Aquinas, Thomas (1271-2) *Quaestio disputata de spe (Disputed Question on Hope)*.(Four articles, written at Paris.)
Aquinas, Thomas (1271-2) *Quaestio disputata de virtutibus cardinalibus (Disputed Question on the Cardinal Virtues)*.(Four articles, written at Paris.)
Aquinas, Thomas (1271-3) *De substantiis separatis, ad fratrem Reginaldum socium suum (On Separated Substances [Angels], for Brother Reginald, his Companion)*.(Written at Paris or Naples, incomplete.)
Aquinas, Thomas (1272) *Quaestio disputata de unione verbi incarnati (Disputed Question on the Unity of the Incarnate Word)*.(Five articles, written at Paris.)
Aquinas, Thomas (1272) *Expositio super librum De causis (Commentary on the Liber de causis)*.(Written at Paris.)
Aquinas, Thomas (1272-3) *Summa theologiae IIIa (Synopsis of Theology, Third Part)*.(Written at Paris and Naples, incomplete.)
Aquinas, Thomas (1272-3) *Sententia super libros De caelo et mundo (Commentary on Aristotle's On Heaven and Earth)*.(Written at Naples, incomplete.)
Aquinas, Thomas (1272-3) *Sententia super libros De generatione et corruptione (Commentary on Aristotle's On Generation and Corruption)*.(Written at Naples, incomplete.)
Aquinas, Thomas (1273, or 1261-8?) *Collationes in decem praecepta (Sermon Commentaries on the Ten Commandments)*.(Written at Naples, 1273, or possibly at Orvieto and Rome, 1261-8.)
Aquinas, Thomas (1273, or 1268-72?) *Collationes super Ave Maria (Sermon Commentaries on the Ave Maria)*.(Written at Naples, 1273, or possibly at Paris, 1268-72.)
Aquinas, Thomas (1273) *Collationes super Credo in Deum (Sermon Commentaries on the Apostles' Creed)*.(Written at Naples, 1273.)
Aquinas, Thomas (1273) *Collationes super Pater Noster (Sermon Commentaries on the Lord's Prayer)*.(Written at Naples, 1273.)

Arama, Isaac ben Moses (*c*.1420-94)

Like many of his fifteenth-century Spanish contemporaries, Arama opposed the Aristotelianism of Maimonides. His philosophical sermons and biblical commentaries attack Jewish Aristotelians on charges of subordinating revelation to reasoning, upholding an eternal universe whose necessity limits God's power, and excluding miracles and individual providence. Yet while stressing the fallibility of human reason, Arama is no fideist. An eclectic, he values reason and philosophy as ways of deepening the understanding of Scripture through allegorical interpretation. He also develops striking philosophical theories of miracles, providence and the fundamentals of faith.

A leading rabbi of the generation that underwent expulsion from Spain in 1492, Isaac ben Moses Arama is best known for the philosophical sermons he composed to counter the conversionist Christian sermons which his congregants were compelled to attend. Preserved in the chapters of his popular and influential biblical commentary, *'Aqedat Yitzhaq (The Binding of Isaac)*, each of these discourses has two parts, one addressing a philosophical or theological problem, the other, like the scholastic *quaestiones* and *dubitationes*, raising issues in the exegesis of a biblical passage, which is then interpreted in light of the earlier philosophical account.

Arama is most influenced by Halevi and Crescas among Jewish thinkers; and, among the Muslims, by al-Ghazali. The essential beliefs of Judaism, he argues, transcend or contradict reason and must be accepted on faith. Even beliefs that lie within the scope of reason should be accepted on faith and only then verified by reason. Just as Abraham overcomes his reason when he determines to sacrifice his son, so the ideal religious person must seek out irresolvable paradoxes of reason, learning to subordinate intellect to faith, philosophy to revelation.

Arama harshly criticizes fourteenth-century Maimonists like Moses of Narbonne (Narboni) and Joseph ibn Caspi (see Averroism, Jewish §§3-4), charging that they favour philosophy over revelation. He is especially sensitive to their use of allegorical exegesis. He himself did much to revive and develop the allegorical method, which had fallen into decline after the 'Maimonidean controversy'; but he also defends the validity of the literal meaning, which is enriched by philosophical interpretation. The Maimonists, by contrast, are charged with seeking to replace the literal sense with the Greek philosophical ideas which they claim to discover as the true meaning of Scripture.

Arama's position in the fifteenth-century debate over the foundational beliefs of Judaism shows the subtlety of his approach to the relations of philosophy and revelation. His articles of faith are the principles essential not just to the idea of a divine law generically but to Judaism uniquely. Connecting these principles with the Mosaic commandments, he argues with Halevi and against Maimonides that one achieves immortality not through intellectual perfection but by performance of the commandments, the one feature that truly distinguishes Judaism from other religions and from the generic theism of a philosopher. The commandments are not themselves articles of faith. Rather, Arama identifies the true principles as those that are embodied in and derived from specific commandments, as belief in creation is embedded in the Sabbath laws.

Creation is the most important of Arama's principles. All the rest are derivable from it. Like Maimonides, he locates the problem of the origin of universe beyond rational demonstration. But creation for him is typical in this respect of all the essential truths of Judaism. Nonetheless, perhaps influenced by Nahmanides, he offers a quasi-Platonic account of the world's origin from pre-existent matter, itself created *ex nihilo* by God. Essential here is the commitment to God's unconstrained will: only if the world was created freely can there be providence, miracles, or divine omnipotence. As evidence against eternity, Arama appeals not only to the diverse and irregular motions of the spheres (as Maimonides did) but also to the occurrence of miracles as, attested in Scripture.

Despite the centrality of miracles and omnipotence in his scheme, Arama does not wish to reject the idea of natural laws. He therefore distinguishes between two coexisting natures: an unintelligent 'natural nature', whose laws apply without regard to human merit, and a 'supernatural nature' directed purposefully by an intelligence sensitive to human deserts. Miracles violate natural nature; but, as instances of supernatural nature, they are fully natural. Besides the observed violations of natural nature that we call miracles, Arama (recalling Nahmanides) argues that 'hidden' miracles occur constantly. Their miraculousness usually goes unnoticed, but their true explanation lies in

supernatural nature. All miracles therefore fall under *a* nature. Analogously, there is a ’natural’ governance that does not attend to the moral perfection of individuals but only to preservation of species, and a second, ‘providential’, governance that is sensitive to the moral perfection of individuals. In general the latter is limited to Israel.

Philosophers deny supernatural nature and providential governance, Arama reasons, only because they rank humanity beneath the celestial spheres and cannot understand why God would violate a higher order for a lower one. Following Saadiah’s premise that humankind is the final act of creation (see Saadiah Gaon), Arama argues that the spheres themselves were created for mankind’s sake and can therefore be manipulated in our behalf. Part of the original creation, moreover, gave man a special power over nature. When the soul rules, establishing the ’divine image’ in the microcosm of the human body, harmony results in the macrocosm as well; when sin disrupts the microcosmic harmony, the macrocosmic harmony is ruptured too, causing universal evils. Human beings can ensure cosmic harmony only by living in harmony with nature - following the natural law, which is most fully realized in the Mosaic Torah. Its commandments instill all moral and intellectual virtues, including those unknown to reason. Only a life according to this revealed law brings the highest, spiritual happiness, the ultimate goal of philosophy.

Arcesilaus (*c*.316-*c*.240 BC)

Arcesilaus of Pitane came to Athens as a young man, and was seduced by Platonic philosophy. Around 265 he became head of the Academy. He turned the school in a sceptical direction, urging that Plato himself had been of a sceptical bent. He revived the Socratic practice of dialectical argument, in which he displayed remarkable logical skill and honeyed oratorical talent. His dialectical prowess led him to 'suspend judgment about everything'; but the main target of his arguments was Stoicism, and in particular Stoic epistemology, which he claimed to reduce to incoherence. Recognizing that a sceptic must live and act, he introduced the notion of 'the reasonable' as a criterion of sceptical action.

1 Life and thought

Arcesilaus was born in Pitane, in north-west Asia Minor. As a youth he was a pupil of the mathematician Autolycus, whom he followed to Sardis. He then travelled to Athens where he studied with Theophrastus. He was destined for a rhetorical career; but his head lay for philosophy. When he removed to the Academy and heard Polemo and Crantor and Crates, he deemed that they were 'either gods or else remnants of those men of old who were formed from the golden generation' (Philodemus, *History of the Academy* XV 5-10). The rest of his life he spent in the Academy. On the death of Crates in *c*.265 BC he became scholarch, a position he held until his death some twenty-five years later.

He was a celebrated figure, known for caustic wit and also for kindness, for oratorical skill and for the rigour of his argumentation. He wrote epigrams, he enjoyed dalliance and dinner parties - and he was regarded as one of the leading philosophers of the age. But he produced no philosophical writings, and what we learn of his views derives from hearsay: perhaps from first-hand hearsay, for we are told that one of his pupils, Pythodorus, took notes of his lectures.

The Stoic Ariston of Chios, his contemporary, parodied a Homeric verse in describing him as 'Plato in front, at the back Pyrrho, Diodorus between them'. Homer was describing the chimera, and Ariston insinuates that Arcesilaus was a philosophical monster, a three-fold hybrid.

Arcesilaus began his philosophical life as an orthodox Platonist (see Plato; Platonism, Early and Middle) - we are told that he acquired a copy of Plato's works as a boy, and that 'at first when he stated a thesis he argued in accordance with the tradition from Plato and Speusippus up to Polemo' (Philodemus, *History of the Academy* XVIII 7-12). He taught a dogmatic Platonism and then became a sceptic.

Later authors spoke of the foundation of a New Academy. But by his own lights Arcesilaus was no innovator - rather, he turned the Academy back to pure Platonism. Not (as some alleged) because he dissembled, secretly teaching unsceptical doctrine, but because (as he argued) Plato himself had been a sceptic. 'From several of Plato's books and Socratic dialogues he took the idea that nothing is certain' (Cicero, *The Orator* III 67). There are indeed sceptical touches in some of Plato's works - notably in the early dialogues, which generally end in puzzlement, and in the *Theaetetus*, which raises and conspicuously fails to answer the question 'What is knowledge?' Yet Arcesilaus could read the Platonic corpus and say that 'in his books nothing is asserted, many issues are argued on both sides, everything is a matter of investigation, nothing certain is said' (Cicero, *Academics* I 46).

Diodorus Cronus was celebrated for 'dialectic': his philosophical interests were absorbed by logical problems and puzzles. Arcesilaus did not himself engage in logical study - indeed, anecdote has him dismiss dialectic. He took after Diodorus in his practice, inasmuch as he too was renowned for his argumentative ingenuity. He excelled at arguing 'on both sides of the question': a proposition (no matter what) is put forward, and first you argue for it and then you argue against it, 'the arguments on each side being equally powerful' (Eusebius, *Preparation of the Gospel* XIV 4.15). The technique finds antecedents in Aristotle's dialectic. Arcesilaus also harked back to Socrates (§3) and the Socratic *elenchos* or method of refutation: a thesis (no matter what) is proposed, and you show by arguments which the proposer must accept that it is untenable.

Each of these two techniques demands logical versatility or sophistical sleight of hand. The ancient sources often link them, for if you can argue for and against any proposition then *a fortiori* you can argue against any thesis, and

if you can argue against any thesis whatsoever then you can argue for and against any proposition.

2 Scepticism

It is Arcesilaus' affinities with Pyrrho, the archetypal sceptic of the ancient world, which give him his philosophical bite. 'He created a new philosophy of non-philosophizing' (Lactantius, *Divine Institutions* IV 11), and introduced suspension of judgment and scepticism into the Academy. But even in antiquity, the nature of Arcesilaus' scepticism was a matter of dispute. According to Numenius (§1), Arcesilaus 'was a Pyrrhonist in all but the name' (Eusebius, *Preparation of the Gospel* XIV 6.6); and a half dozen texts, independent of one another and drawing on early sources, agree that Arcesilaus 'suspended judgment about everything': that is to say, he held no beliefs on any subject, and the end of his philosophizing was the eradication of all belief and the introduction of universal suspension of judgment.

Arcesilaus' logical techniques open a direct route to Pyrrhonism (see Pyrrhonism). If you can produce equally powerful arguments on each side of a proposition, then you will neither believe nor disbelieve that proposition, and if you can produce equally powerful arguments on each side of every proposition, then you will believe no proposition at all. And Arcesilaus had a second route to Pyrrhonism, for he championed *akatalēpsia* or 'inapprehensibility': 'he denied that there is anything which can be known - not even the one thing which Socrates allowed himself, that he knew that he knew nothing' (Cicero, *Academics* I 45). Hence if you have any beliefs, they will be mere opinions. But no one of any sense embraces what he takes to be a mere opinion. Hence no one of any sense will hold any beliefs.

Arcesilaus was a polemicist. He attacked all-comers and exploded any thesis anyone might propose, 'affirming nothing himself but merely refuting other positions' (Philodemus, *History of the Academy* XX 1-4). Such a polemical scepticism is the natural child of the Socratic *elenchos*, and some scholars have urged that Arcesilaus' philosophy was essentially a negative and a destructive thing. But polemical scepticism easily fades into Pyrrhonism. For if I refute a thesis which you propound, then I shall not uphold the thesis myself; if I can refute any thesis which is propounded to me, then I shall believe no thesis; and so I shall end up as a Pyrrhonist.

It is sometimes supposed that Arcesilaus always argued *ad hominem*: if you maintain a certain thesis, then Arcesilaus will show not that *the thesis* is untenable but that *you* have no good grounds for maintaining it. It is consistent with a successful *ad hominem* argument that *there are* good grounds for holding the thesis, and that Arcesilaus himself holds it on such grounds. Yet the *ad hominem* approach, universally applied, again fades into Pyrrhonism, for if Arcesilaus can argue *ad hominem* against all-comers, then in effect he can argue against any thesis.

Much of Arcesilaus' philosophical activity was directed against the Stoics. Thus he took the Stoic thesis that two stuffs may completely blend or interpenetrate and, relying wholly on ideas which the Stoics themselves maintained, reduced it to absurdity. (He chose a grotesque example: amputate your leg, grind it up, and blend it into the Aegean sea. By the thesis of interpenetration, the leg will blend with every part of the sea and the fleet of King Antigonus will sail through your leg.)

The Stoics held that if you know something, you must have 'apprehended' it; that apprehension is assent to an 'apprehensive appearance' (*phantasia katalēptikē*); and that an appearance of something is apprehensive if it is true of that thing, if it was caused by that thing, and if it could not have been produced by anything else (see Stoicism §12). Arcesilaus urged that the third of these conditions could never be met and hence that there are no apprehensive appearances. Hence 'everything being inapprehensible, it will follow that, for the Stoics too, the Sage suspends judgment' (Sextus Empiricus, *Against the Mathematicians* VII 155).

But if Arcesilaus was at his most vigorous against the Stoics, no ancient text suggests that anti-Stoicism exhausted his intellectual parts. The evidence suggests rather that the quarrel with the Stoics was one glamorous episode in his campaign to restore peace and scepticism to the land: the Stoics were the leading 'dogmatic' philosophers in town, and any sceptic would feel bound to have a confrontation with them. In any event, the arguments which Arcesilaus used against the Stoics could readily be adapted for use against others: a clever philosopher would not ignore and a combative philosopher would not decline these tempting possibilities. Anti-Stoicism, in other words, soon leaches into a more general *ad hominem* scepticism and hence, in the end, into Pyrrhonism.

It has often been wondered if Pyrrhonian scepticism is a serious or an interesting philosophical option. One argument which ancient dogmatists deployed against their sceptical colleagues was the following. Human actions are characteristically explained in terms of the beliefs (and the desires) of their agents. But sceptics have no beliefs. Hence sceptics cannot act. Hence sceptics cannot live - the only good sceptic is a dead sceptic.

Arcesilaus was aware of this argument, and had an answer. The argument, he claimed, supposes that three things are necessary for action: before you sink your teeth into the succulent flesh, you must have received an appearance (‘That apple looks ripe’), you must have given your ‘assent’ and formed a belief (‘That apple is ripe’), and you must have had an impulse or desire (you wanted to eat a ripe apple). Arcesilaus demurred:

> *Two* things are necessary for action, an appearance of something appropriate and an impulse towards the appropriate item which has appeared - and neither of these conflicts with suspension of judgement. It is belief, and not appearance or impulse, from which argument separates us.
>
> (Plutarch, *Against Colotes* 1122C-D)

The apple looks juicy and Arcesilaus wants an apple - so he eats it. No belief intervenes, and none is needed. It is enough to ‘follow the appearances’.

In addition Arcesilaus observed that ‘anyone who suspends judgment about everything will measure his choices and aversions, and in general his actions, by what is reasonable (*to eulogon*); and if he proceeds in accordance with this standard (*kritērion*) he will be successful’ (Sextus Empiricus, *Against the Mathematicians* VII 158). A sceptic will choose to perform those actions which, were they done, could be reasonably defended. Is Arcesilaus here telling us what *dogmatists* - what *Stoics* - will be obliged to do, once his arguments have reduced them to scepticism? Or is he reflecting more generally on the way in which any sceptics will make their way through the world? And in the latter case, are his reflections compatible with scepticism - can a sceptic consistently appeal to ‘the reasonable’? To such teasing questions our texts yield no safe answers.

Archaeology, philosophy of

Questions about the scientific status of archaeology have been central to field-defining debates since the late nineteenth century and have frequently involved appeals to philosophical sources. With the possible exception of Collingwood, however, there was little systematic exploration of the bearing of philosophical literature on these questions until the advent, in the 1960s and 1970s, of the New Archaeology, a self-consciously positivist research programme. The New Archaeology originated in North America but has been widely influential, especially in giving prominence to philosophical and theoretical issues. The New Archaeologists' advocacy of a positivist (Hempelian) conception of scientific goals and practice provoked intense debate which involved philosophers of science as well as archaeologists from the early 1970s. Although the positivist commitments of the programme were widely repudiated a decade later, philosophical exchange has continued and expanded to include consideration of a range of post-positivist models of scientific inference that emphasize the theory-ladeness of archaeological evidence, as well as hermeneutic and post-structuralist models of archaeological interpretation. The analysis of epistemological issues is also closely tied to foundational questions about how the cultural subject of archaeological inquiry should be conceptualized and has led, increasingly, to a consideration of normative questions about the values and interests that shape archaeological research and the ethical responsibilities of practitioners. In 1992 Embree argued that work in this area had achieved sufficient maturity to be recognized as a subfield which he designated 'meta-archaeology'.

1 The emergence of meta-archaeology

As advocates of an explicitly scientific research programme, the New Archaeologists rejected what they described as traditional 'inductive' practice; they insisted that law-governed, deductive-nomological explanation should be their primary goal, and that interpretive hypotheses should be rigorously tested following a hypothetico-deductive model of confirmation (see Explanation §2). When these commitments were made explicit in the early 1970s they generated debate within archaeology about philosophical theories of science which drew the attention of several philosophers. R.A. Watson consistently defended the positivist orientation of the New Archaeology against its critics. Most others objected that internal, philosophical critiques had substantially undermined Hempelian models by the 1970s (see Explanation §3), when they were taken up by archaeologists, and cautioned against treating philosophical models as authoritative recipes for scientific practice; these are properly 'theses to be argued', not 'established truths' (Nickles 1977: 164). Despite the contentious tone of some of these exchanges, a number of philosophers and archaeologists persisted in discussion across disciplinary boundaries, and have produced an increasingly sophisticated, diverse and resolutely interdisciplinary literature on philosophical issues raised by and about archaeological practice.

Contributors to this jointly archaeological and philosophical literature frequently address questions about how the project of meta-archaeology should be defined and situated. Some insist that there are irreducible differences between the interests of philosophers and archaeologists, even where similar questions seem to be at issue. Typically, however, the case is made for establishing meta-archaeology as an interdisciplinary venture that includes a range of science study disciplines. As such, philosophy of archaeology may exemplify a pattern of development within post-positivist philosophy of science which has led philosophers in many areas to establish increasingly close ties with the sciences they study.

2 Explanation

The New Archaeologists attempted to fit the explanatory goals of their discipline to a particularly narrow philosophical template. After an initial round of debate which focused on standard philosophical objections to covering-law models, attention turned to questions about explanation that arise from archaeological practice. At one end of a continuum of views are arguments that explanation should not be treated as the central objective of scientific inquiry, however conceptualized. Morgan (1973) took this position in debate with Watson *et al.* (1971). Kelley and Hanen (1988) have since argued that an antirealist, pragmatist view of explanation makes best sense of archaeological practice; on this account explanations are simply answers to 'why-questions' which deploy whatever scientifically credible information will satisfy a specific inquirer (see Scientific realism and antirealism). Although this suggests that explanation is a byproduct of scientific inquiry, not its goal, Kelley and Hanen also

treat explanatory power as a key consideration in the evaluation of competing hypotheses, so explanatory goals, reconceptualized, remain central to their account. A robustly realist alternative has been proposed by Gibbon (1989), and causalist models have been developed by Salmon (1982), who recommends a 'causally supplemented' statistical-relevance model of explanation, and by Wylie (1996a), who uses archaeological examples as the basis for a critique of unificationist accounts of explanation. As in these last cases, close consideration of archaeological practice frequently leads to the reassessment of philosophical models. For example, Nickles (1977) uses archaeological examples to establish a case for recognizing forms of 'singular causal' explanation which do not depend on laws, and Salmon (1982) argues that any adequate account of explanation must make sense of forms of functional explanation which are ubiquitous in archaeology (see Causation; Explanation; Functional explanation).

Analyses of explanation in archaeology are closely connected to foundational questions about the nature of the cultural subject matter. The New Archaeologists conceptualized their subject domain in terms that could support a search for laws; cultures were understood to be ecologically adaptive systems, and the New Archaeologists' ambition was to understand, not just the specific events and conditions that produced the archaeological record but, through them, larger scale processes shaping cultural systems in adaptation to their external environments. Archaeological critics insisted, on ethnographic and archaeological grounds, that this view is untenable; dynamics internal to the ethnographic life-world of cultural subjects can substantially shape the large scale, long term development of cultural systems. Likewise, most parties to the philosophical debate about explanation in archaeology insist that questions of content cannot be settled in advance; models of explanation must be flexible enough to accommodate reconstructions of beliefs, intentions, cultural conventions, social institutions, and various 'cognitive' dimensions of human life, even though some of these are unlikely to be law-governed (Nickles 1977) or accessible to material-causal analysis (Salmon 1982). Some urge recognition that, in practice, the 'archaeological record' is treated ambiguously, both as a fossil record which requires scientific modes of explanation and as a textual record of intentional, meaningful action, for which interpretive approaches are appropriate (Patrik 1985) (see Explanation in history and social science). The advocates of interpretivist approaches are influenced by Collingwood's argument that historians must grasp the 'insides of actions' (Hodder 1991); by symbolic and structuralist trends in anthropology (Hodder 1982); by hermeneutics, phenomenology and critical theory (Leone 1982; Preucel 1991) (see Structuralism in social science; Hermeneutics; Phenomenology, epistemetic issues in; Critical theory). Increasingly, those who endorse scientific modes of inquiry also insist on the importance of considering 'cognitive' dimensions of the cultural past (Gardin and Peebles 1992; Bell 1994).

As discussion of the goals of archaeology has expanded, it has become clear that archaeologists 'explain' in many different senses and at different levels. Frequently they explain archaeological data in quite localized terms, as the products of specific events, conditions of life, intentional actions, and the various 'formation processes' responsible for the surviving archaeological record. The more ambitious goal of understanding large scale cultural processes both depends upon and is continuous with these more modest explanations.

3 Inference

A second major theme in the philosophical literature on archaeology is the concern to explicate the forms of inference by which archaeological data are systematized, and hypotheses about the cultural past are generated and evaluated in light of these data. Reacting to the deductivism of the New Archaeology, philosophical analysts have explored a range of models which more adequately capture the inductive complexity of archaeological practice. Salmon (1982) proposes a modified Bayesian account as a framework for understanding the nuanced judgements archaeologists make about the significance of archaeological evidence; for example, where the confirming or disconfirming import of specific evidential outcomes is assessed in light of the prior plausibility of a test hypothesis and the likelihood that the evidence in question uniquely confirms this hypothesis (see Confirmation theory; Probability theory and epistemology). The comparative nature of hypothesis evaluation is emphasized by Kelley and Hanen (1988) who also argue that, in addition to considerations of empirical adequacy, explanatory power and consistency with established 'core beliefs' play a crucial role in hypothesis evaluation. They conclude that archaeological practice is best understood as a matter of 'inference to the best explanation' which proceeds through 'eliminative induction'; assessments of evidential support serve as grounds for eliminating implausible hypotheses as much as for accepting those that seem relatively well confirmed (see Inference to the best explanation). Gibbon (1989) holds a similar position but, as a realist, can argue that 'best explanations' are those

which afford the most comprehensive and plausible causal explanation of the available data. In 1994, Bell renewed the argument against ‘inductivism’ and formulated a set of guidelines for archaeological inquiry that translate, into practical terms, the central philosophical insights of Popperian refutationism (see Popper, K.R. §2). Bell urged archaeologists to treat hypothesis evaluation as a matter of endangering bold conjectures rather than of building evidential support for hypotheses.

A condition for evaluating claims about the cultural past, on any of these models, is the formulation of typologies and other tools of analysis which allow archaeologists to systematize their data. Since the 1930s, typological constructs have been the subject of ongoing debate within archaeology. The central questions are whether useful, perspicuous typologies are nothing more than problem-specific ‘tools’ for manipulating data or have greater significance, capturing structures inherent in archaeological assemblages and, perhaps, underlying cultural norms and categories (see Taxonomy). A sophisticated argument for ‘typological instrumentalism’ is developed by Adams and Adams (1991), and an account of the inferential processes underlying all forms of ‘archaeological constructs’ is proposed by Gardin (1980) using a ‘logicist’ approach. Both draw attention to the selective, interpretive dimensions of the process by which archaeologists describe and systematize their data.

4 Evidence

Since the mid-1980s the most pressing epistemological problem raised by archaeology is that of explaining how, and under what conditions, archaeological data may be taken as evidence of the cultural past. Early analysis focused on the role of analogical inference in establishing the evidential significance of archaeological data. Despite the New Archaeologists’ categorical rejection of analogical inference as a form of speculative induction - a projection of the present onto the past - several philosophical commentators argued that ampliative inference of this sort is inescapable, and that it can be closely controlled (Salmon 1982; Wylie 1985). Shelley (1996) has since developed a sophisticated account of abductive reasoning in archaeology that considers the role of visual mental imagery in generating hypotheses about the cultural significance of archaeological material.

By the early 1980s, both critics and proponents of archaeological positivism had accepted the point that archaeological data are necessarily ‘theory-laden’ (see Observation §§3-4). These data stand as evidence of the cultural past only under interpretation, and their interpretation depends on a wide array of auxiliary assumptions (‘middle-range theory’) which establish causal, functional, symbolic and other connections between elements of material culture and the conditions responsible for their production and survival in archaeological contexts. While many archaeologists have made it a priority to develop the necessary linking principles through experimental and ethnographic research, others insist that such principles can never stabilize ‘ascriptions of meaning’ to archaeological data: interpretively constituted evidence cannot provide an ‘independent’ test for explanatory or interpretive hypotheses. In a discussion of ‘bootstrapping’ models of confirmation, Wylie (1986) has argued that the reliance on auxiliaries need not entail vicious circularity: it is not necessarily the case that the linking principles required to establish evidential significance will ensure support for a favoured hypothesis even if both derive from a common theory. This strategy is further developed in analyses of various kinds and degrees of independence that may be realized between hypotheses and supporting or test evidence by Wylie (1996b; Pinsky and Wylie 1989), and by Kosso (1991, 1992, 1993) in an important series of articles on ‘observation of the past’.

5 Contextualism, ideals of objectivity and professional ethics

Challenges to ideals of objectivity, which have dominated archaeological debate since the early 1980s, arise not only from concerns about the instability of evidence but from reflection on the results of detailed empirical studies of the ‘sociopolitics’ of archaeology. These have been undertaken largely by archaeologists and document the influence on archaeology of its colonial, nationalist and imperialist entanglements (Trigger 1989); its relationship to intra-national and international elites; its class structure (Patterson 1986, 1995); its assimilation of racist and sexist presuppositions (Trigger 1980; Gero and Conkey 1991); and myriad features of its funding base, internal communication patterns, institutionalization, recruiting and training, and reward structures (Gero, Lacey and Blakey 1983; Kelley and Hanen 1988; Gibbon 1989). Although these analyses undermine objectivist ideals which make a primary virtue of neutrality and value freedom, most who urge attention to ‘contextual’ factors resist relativist conclusions. Their hope is that critical analysis will make archaeology more accountable for its presuppositions and will yield better informed judgments about the credibility and likely limitations of archaeological knowledge.

The pressure to engage normative issues has been mounting since the early 1970s when it became clear that the future of archaeology was threatened by accelerated destruction of archaeological resources and an unprecedented expansion of the international antiquities market. In addition, descendent populations and other national and public interest groups have challenged archaeologists' rights of access to archaeological sites and material, often on grounds that scientific investigation does not serve their interests in what they regard as their cultural heritage. Such changes in the contexts of archaeological practice raise ethical questions about whether archaeologists are ever justified in making professional use of looted or illegally traded material; whether they should consider the preservation of archaeological resources as important a goal as that of exploiting them for scientific purposes; what responsibilities they have to communities affected by their research; and how the goals of scientific investigation are to be weighed against heritage interests when these conflict (see, for example, Salmon 1997; Wylie 1996c).
